[47332] Another function of VGAM1335 is therefore inhibition of Chromosome 1 Open Reading Frame 22 (C1orf22, Accession NM_025191). Accordingly, utilities of VGAM1335 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf22. Cyclin M1 (CNNM1, Accession NM_020348) is another VGAM1335 host target gene. CNNM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CNNM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNNM1 BINDING SITE, designated SEQ ID:21612, to the nucleotide sequence of VGAM1335 RNA, herein designated VGAM RNA, also designated SEQ ID:4046.

[47333] Another function of VGAM1335 is therefore inhibition of Cyclin M1 (CNNM1, Accession NM_020348). Accordingly, utilities of VGAM1335 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNNM1. FLJ10619 (Accession NM_018156) is another VGAM1335 host target gene. FLJ10619 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10619, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10619 BINDING SITE, designated SEQ ID:19970, to the nucleotide sequence of VGAM1335 RNA, herein designated VGAM RNA, also designated SEQ ID:4046.

[47334] Another function of VGAM1335 is therefore inhibition of FLJ10619 (Accession NM_018156). Accordingly, utilities of VGAM1335 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10619. FLJ20986 (Accession NM_024524) is another VGAM1335 host target gene. FLJ20986 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ20986, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20986 BINDING SITE, designated SEQ ID:23729, to the nucleotide sequence of VGAM1335 RNA, herein designated VGAM RNA, also designated SEQ ID:4046.

[47335] Another function of VGAM1335 is therefore inhibition of FLJ20986 (Accession NM_024524). Accordingly, utilities of VGAM1335 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ20986. KIAA0748 (Accession NM_014796) is another VGAM1335 host target gene. KIAA0748 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0748, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0748 BINDING SITE, designated SEQ ID:16702, to the nucleotide sequence of VGAM1335 RNA, herein designated VGAM RNA, also designated SEQ ID:4046.

[47336] Another function of VGAM1335 is therefore inhibition of KIAA0748 (Accession NM_014796). Accordingly, utilities of VGAM1335 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0748. MDS028 (Accession NM_018463) is another VGAM1335 host target gene. MDS028 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MDS028, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MDS028 BINDING SITE, designated SEQ ID:20537, to the nucleotide

sequence of VGAM1335 RNA, herein designated VGAM RNA, also designated SEQ ID:4046.

[47337] Another function of VGAM1335 is therefore inhibition of MDS028 (Accession NM_018463). Accordingly, utilities of VGAM1335 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MDS028. Pleiomorphic Adenoma Gene-like 2 (PLAGL2, Accession XM_047007) is another VGAM1335 host target gene. PLAGL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PLAGL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLAGL2 BINDING SITE, designated SEQ ID:34883, to the nucleotide sequence of VGAM1335 RNA, herein designated VGAM RNA, also designated SEQ ID:4046.

[47338] Another function of VGAM1335 is therefore inhibition of Pleiomorphic Adenoma Gene-like 2 (PLAGL2, Accession XM_047007). Accordingly, utilities of VGAM1335 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLAGL2. SCYB5 (Accession NM_002994) is another VGAM1335 host target gene.

SCYB5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCYB5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCYB5 BINDING SITE, designated SEQ ID:8885, to the nucleotide sequence of VGAM1335 RNA, herein designated VGAM RNA, also designated SEQ ID:4046.

[47339] Another function of VGAM1335 is therefore inhibition of SCYB5 (Accession NM_002994). Accordingly, utilities of VGAM1335 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCYB5. Tumor Protein P53 Inducible Nuclear Protein 1 (TP53INP1, Accession NM_033285) is another VGAM1335 host target gene. TP53INP1 BINDING SITE1 and TP53INP1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TP53INP1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TP53INP1 BINDING SITE1 and TP53INP1 BINDING SITE2, designated SEQ ID:27113 and SEQ ID:36122 respectively, to the nucleotide sequence of VGAM1335 RNA, herein

designated VGAM RNA, also designated SEQ ID:4046.

[47340] Another function of VGAM1335 is therefore inhibition of Tumor Protein P53 Inducible Nuclear Protein 1 (TP53INP1, Accession NM_033285). Accordingly, utilities of VGAM1335 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TP53INP1. LOC158798 (Accession XM_088671) is another VGAM1335 host target gene. LOC158798 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC158798, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158798 BINDING SITE, designated SEQ ID:39893, to the nucleotide sequence of VGAM1335 RNA, herein designated VGAM RNA, also designated SEQ ID:4046.

[47341] Another function of VGAM1335 is therefore inhibition of LOC158798 (Accession XM_088671). Accordingly, utilities of VGAM1335 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158798. LOC196411 (Accession XM_113714) is another VGAM1335 host target gene. LOC196411 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by LOC196411, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196411 BINDING SITE, designated SEQ ID:42364, to the nucleotide sequence of VGAM1335 RNA, herein designated VGAM RNA, also designated SEQ ID:4046.

[47342] Another function of VGAM1335 is therefore inhibition of LOC196411 (Accession XM_113714). Accordingly, utilities of VGAM1335 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196411. LOC90233 (Accession NM_138347) is another VGAM1335 host target gene. LOC90233 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90233, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90233 BINDING SITE, designated SEQ ID:28745, to the nucleotide sequence of VGAM1335 RNA, herein designated VGAM RNA, also designated SEQ ID:4046.

[47343] Another function of VGAM1335 is therefore inhibition of LOC90233 (Accession NM_138347). Accordingly, utilities

of VGAM1335 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90233. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1336 (VGAM1336) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47344] VGAM1336 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1336 was detected is described hereinabove with reference to Figs. 1-8.

[47345] VGAM1336 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sheeppox Virus. VGAM1336 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47346] VGAM1336 gene encodes a VGAM1336 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1336 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM1336 precursor RNA is designated SEQ ID:1322, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1322 is located at position 83573 relative to the genome of Sheeppox Virus.

- [47347] VGAM1336 precursor RNA folds onto itself, forming VGAM1336 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [47348] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1336 folded precursor RNA into VGAM1336 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1336 RNA is designated SEQ ID:4047, and

is provided hereinbelow with reference to the sequence listing part.

[47349] VGAM1336 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1336 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1336 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[47350] VGAM1336 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1336 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1336 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM1336 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1336 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[47351] The complementary binding of VGAM1336 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1336 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1336 host target RNA into VGAM1336 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47352] It is appreciated that VGAM1336 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1336 host target genes. The mRNA of each one of this plurality of VGAM1336 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com–

plementary to VGAM1336 RNA, herein designated VGAM RNA, and which when bound by VGAM1336 RNA causes inhibition of translation of respective one or more VGAM1336 host target proteins.

[47353] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1336 gene, herein designated VGAM GENE, on one or more VGAM1336 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[47354] It is yet further appreciated that a function of VGAM1336 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1336 include diagnosis, prevention and treatment of viral infection by Sheeppox Virus. Specific functions, and accordingly utilities, of VGAM1336 correlate with, and may be deduced from, the identity of the host target genes which VGAM1336 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47355] Nucleotide sequences of the VGAM1336 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1336 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1336 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1336 are further described hereinbelow with reference to Table 1.

[47356] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1336 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1336 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47357] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM1336 gene, herein designated VGAM is inhibition of expression of VGAM1336 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1336 correlate with, and may be deduced from, the identity of the target genes which VGAM1336 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[47358] NCK-associated Protein 1 (NCKAP1, Accession NM_013436) is a VGAM1336 host target gene. NCKAP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NCKAP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NCKAP1 BINDING SITE, designated SEQ ID:15095, to the nucleotide sequence of VGAM1336 RNA, herein designated VGAM RNA, also designated SEQ ID:4047.

[47359] A function of VGAM1336 is therefore inhibition of NCK-associated Protein 1 (NCKAP1, Accession NM_013436). Accordingly, utilities of VGAM1336 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCKAP1. ATPase, Class V, Type 10D

(ATP10D, Accession XM_054907) is another VGAM1336 host target gene. ATP10D BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP10D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP10D BINDING SITE, designated SEQ ID:36200, to the nucleotide sequence of VGAM1336 RNA, herein designated VGAM RNA, also designated SEQ ID:4047.

[47360] Another function of VGAM1336 is therefore inhibition of ATPase, Class V, Type 10D (ATP10D, Accession XM_054907). Accordingly, utilities of VGAM1336 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP10D. FLJ12085 (Accession NM_022771) is another VGAM1336 host target gene. FLJ12085 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12085, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12085 BINDING SITE, designated SEQ ID:23032, to the nucleotide sequence of VGAM1336

RNA, herein designated VGAM RNA, also designated SEQ ID:4047.

[47361] Another function of VGAM1336 is therefore inhibition of FLJ12085 (Accession NM_022771). Accordingly, utilities of VGAM1336 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12085. Microtubule-actin Crosslinking Factor 1 (MACF1, Accession NM_012090) is another VGAM1336 host target gene. MACF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MACF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MACF1 BINDING SITE, designated SEQ ID:14379, to the nucleotide sequence of VGAM1336 RNA, herein designated VGAM RNA, also designated SEQ ID:4047.

[47362] Another function of VGAM1336 is therefore inhibition of Microtubule-actin Crosslinking Factor 1 (MACF1, Accession NM_012090). Accordingly, utilities of VGAM1336 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MACF1. SCLY (Accession NM_016510) is another VGAM1336 host target

gene. SCLY BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCLY, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCLY BINDING SITE, designated SEQ ID:18588, to the nucleotide sequence of VGAM1336 RNA, herein designated VGAM RNA, also designated SEQ ID:4047.

[47363] Another function of VGAM1336 is therefore inhibition of SCLY (Accession NM_016510). Accordingly, utilities of VGAM1336 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCLY. LOC143879 (Accession XM_084666) is another VGAM1336 host target gene. LOC143879 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC143879, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143879 BINDING SITE, designated SEQ ID:37658, to the nucleotide sequence of VGAM1336 RNA, herein designated VGAM RNA, also designated SEQ ID:4047.

[47364] Another function of VGAM1336 is therefore inhibition of

LOC143879 (Accession XM_084666). Accordingly, utilities of VGAM1336 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143879. LOC197131 (Accession XM_113823) is another VGAM1336 host target gene. LOC197131 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC197131, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197131 BINDING SITE, designated SEQ ID:42447, to the nucleotide sequence of VGAM1336 RNA, herein designated VGAM RNA, also designated SEQ ID:4047.

[47365] Another function of VGAM1336 is therefore inhibition of LOC197131 (Accession XM_113823). Accordingly, utilities of VGAM1336 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197131. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1337 (VGAM1337) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[47366] VGAM1337 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1337 was detected is described hereinabove with reference to Figs. 1–8.

[47367] VGAM1337 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sheeppox Virus. VGAM1337 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47368] VGAM1337 gene encodes a VGAM1337 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1337 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1337 precursor RNA is designated SEQ ID:1323, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1323 is located at position 84667 relative to the genome of Sheeppox Virus.

[47369] VGAM1337 precursor RNA folds onto itself, forming VGAM1337 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two–

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47370] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1337 folded precursor RNA into VGAM1337 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1337 RNA is designated SEQ ID:4048, and is provided hereinbelow with reference to the sequence listing part.

[47371] VGAM1337 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1337 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1337 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[47372] VGAM1337 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1337 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1337 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1337 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1337 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[47373] The complementary binding of VGAM1337 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1337 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1337 host target RNA into VGAM1337 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47374] It is appreciated that VGAM1337 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1337 host target genes. The mRNA of each one of this plurality of VGAM1337 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1337 RNA, herein designated VGAM RNA, and which when bound by VGAM1337 RNA causes inhibition of translation of respective one or more VGAM1337 host target proteins.

[47375] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1337 gene, herein designated VGAM GENE, on one

or more VGAM1337 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[47376] It is yet further appreciated that a function of VGAM1337 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1337 include diagnosis, prevention and treatment of viral infection by Sheeppox Virus. Specific functions, and accordingly utilities, of VGAM1337 correlate with, and may be deduced from, the identity of the host target genes which VGAM1337 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47377] Nucleotide sequences of the VGAM1337 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1337 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1337 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1337 are further described hereinbelow with reference to Table 1.

[47378] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1337 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1337 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47379] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1337 gene, herein designated VGAM is inhibition of expression of VGAM1337 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1337 correlate with, and may be deduced from, the identity of the target genes which VGAM1337 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[47380] RAN Binding Protein 2 (RANBP2, Accession NM_006267) is

a VGAM1337 host target gene. RANBP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RANBP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RANBP2 BINDING SITE, designated SEQ ID:12948, to the nucleotide sequence of VGAM1337 RNA, herein designated VGAM RNA, also designated SEQ ID:4048.

[47381] A function of VGAM1337 is therefore inhibition of RAN Binding Protein 2 (RANBP2, Accession NM_006267), a gene which is thought to control a variety of cellular functions through its interactions with other proteins. Accordingly, utilities of VGAM1337 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RANBP2. The function of RANBP2 has been established by previous studies. RAN (OMIM Ref. No. 601179) is a small GTP-binding protein of the RAS superfamily (see OMIM Ref. No. 190020) that is associated with the nuclear membrane and is thought to control a variety of cellular functions through its interactions with other proteins. Yokoyama et al. (1995) described a human cDNA for one such RAN-binding protein which they cloned us-

ing a 2-hybrid screen with RAN. The cDNA, designated RANBP2 (RAN-binding protein-2) by them, encodes a very large protein (3,224 amino acids) that was immunolocalized to the nuclear pore complex. The protein has a 700-residue leucine-rich domain at the amino end, 4 motifs in common with RANBP1 (OMIM Ref. No. 601180), 8 zinc finger motifs, and a C terminus related to cyclophilin (OMIM Ref. No. 123840). The authors showed that an antibody directed against RANBP2 inhibited nuclear import. Beddow et al. (1995) described a nearly identical partial cDNA which contains a motif of about 150 residues that stabilizes the GTP-bound state of RAN. A mutation in that domain markedly reduced RAN binding. The gene is also referred to as NUP358 (Wu et al., 1995). Pichler et al. (2002) showed that the nucleoporin RANBP2 has SUMO1 (OMIM Ref. No. 601912) E3-like activity. RANBP2 directly interacts with the E2 enzyme UBC9 (OMIM Ref. No. 601661) and strongly enhances SUMO1 transfer from UBC9 to the SUMO1 target SP100 (OMIM Ref. No. 604585). The E3-like activity is contained within a 33-kD domain of RANBP2 that lacks RING finger motifs and does not resemble PIAS (see OMIM Ref. No. 603566) family proteins. These findings placed sumoylation at the cytoplasmic fila-

ments of the nuclear pore complexes and suggested that, at least for some substrates, modification and nuclear import are linked events.

[47382] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[47383] Beddow, A. L.; Richards, S. A.; Orem, N. R.; Macara, I. G. : The Ran/TC4 GTPase-binding domain: identification by expression cloning and characterization of a conserved sequence motif. *Proc. Nat. Acad. Sci.* 92: 3328–3332, 1995. ; and

[47384] Pichler, A.; Gast, A.; Seeler, J. S.; Dejean, A.; Melchior, F. : The nucleoporin RanBP2 has SUMO1 E3 ligase activity. *Cell* 108: 109–120, 2002.

[47385] Further studies establishing the function and utilities of RANBP2 are found in John Hopkins OMIM database record ID 601181, and in cited publications numbered 9499–9504 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. DKFZp761D0614 (Accession XM_113634) is another VGAM1337 host target gene. DKFZp761D0614 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp761D0614,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761D0614 BINDING SITE, designated SEQ ID:42313, to the nucleotide sequence of VGAM1337 RNA, herein designated VGAM RNA, also designated SEQ ID:4048.

[47386] Another function of VGAM1337 is therefore inhibition of DKFZp761D0614 (Accession XM_113634). Accordingly, utilities of VGAM1337 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761D0614. FLJ10546 (Accession XM_002989) is another VGAM1337 host target gene. FLJ10546 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10546, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10546 BINDING SITE, designated SEQ ID:29910, to the nucleotide sequence of VGAM1337 RNA, herein designated VGAM RNA, also designated SEQ ID:4048.

[47387] Another function of VGAM1337 is therefore inhibition of FLJ10546 (Accession XM_002989). Accordingly, utilities of

VGAM1337 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10546. FLJ23074 (Accession NM_025052) is another VGAM1337 host target gene. FLJ23074 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23074, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23074 BINDING SITE, designated SEQ ID:24651, to the nucleotide sequence of VGAM1337 RNA, herein designated VGAM RNA, also designated SEQ ID:4048.

[47388] Another function of VGAM1337 is therefore inhibition of FLJ23074 (Accession NM_025052). Accordingly, utilities of VGAM1337 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23074. LOC123628 (Accession XM_063764) is another VGAM1337 host target gene. LOC123628 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC123628, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC123628 BINDING SITE, designated SEQ ID:37254, to the nucleotide sequence of VGAM1337 RNA, herein designated VGAM RNA, also designated SEQ ID:4048.

[47389] Another function of VGAM1337 is therefore inhibition of LOC123628 (Accession XM_063764). Accordingly, utilities of VGAM1337 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC123628. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1338 (VGAM1338) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47390] VGAM1338 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1338 was detected is described hereinabove with reference to Figs. 1-8.

[47391] VGAM1338 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola Virus. VGAM1338 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47392] VGAM1338 gene encodes a VGAM1338 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1338 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1338 precursor RNA is designated SEQ ID:1324, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1324 is located at position 146622 relative to the genome of Variola Virus.

[47393] VGAM1338 precursor RNA folds onto itself, forming VGAM1338 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47394] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1338 folded precursor RNA into VGAM1338 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM1338 RNA is designated SEQ ID:4049, and is provided hereinbelow with reference to the sequence listing part.

[47395] VGAM1338 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1338 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1338 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[47396] VGAM1338 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1338 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1338 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1338 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1338 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[47397] The complementary binding of VGAM1338 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1338 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1338 host target RNA into VGAM1338 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47398] It is appreciated that VGAM1338 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1338 host target genes. The mRNA of each one of this plurality of VGAM1338 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1338 RNA, herein designated VGAM RNA, and which when bound by VGAM1338 RNA causes inhibition of translation of respective one or more VGAM1338 host target proteins.

[47399] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1338 gene, herein designated VGAM GENE, on one or more VGAM1338 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,
`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[47400] It is yet further appreciated that a function of VGAM1338 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1338 include diagnosis, prevention and treatment of viral infection by Variola Virus. Specific functions, and accordingly utilities, of VGAM1338 correlate with, and may be deduced from, the identity of the host target genes which VGAM1338 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47401] Nucleotide sequences of the VGAM1338 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1338 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1338 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1338 are further described hereinbelow with reference to Table 1.

[47402] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1338 host target RNA, and

schematic representation of the complementarity of each of these host target binding sites to VGAM1338 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47403] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1338 gene, herein designated VGAM is inhibition of expression of VGAM1338 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1338 correlate with, and may be deduced from, the identity of the target genes which VGAM1338 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[47404] FLJ13769 (Accession NM_025012) is a VGAM1338 host target gene. FLJ13769 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13769, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13769 BINDING SITE, designated SEQ ID:24595, to the nucleotide sequence of VGAM1338 RNA, herein designated VGAM RNA, also designated SEQ ID:4049.

[47405] A function of VGAM1338 is therefore inhibition of

FLJ13769 (Accession NM_025012). Accordingly, utilities of VGAM1338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13769. KIAA1958 (Accession XM_088566) is another VGAM1338 host target gene. KIAA1958 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1958, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1958 BINDING SITE, designated SEQ ID:39830, to the nucleotide sequence of VGAM1338 RNA, herein designated VGAM RNA, also designated SEQ ID:4049.

[47406] Another function of VGAM1338 is therefore inhibition of KIAA1958 (Accession XM_088566). Accordingly, utilities of VGAM1338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1958. MGC26651 (Accession NM_144642) is another VGAM1338 host target gene. MGC26651 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC26651, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of MGC26651 BINDING SITE, designated SEQ ID:29470, to the nucleotide sequence of VGAM1338 RNA, herein designated VGAM RNA, also designated SEQ ID:4049.

[47407] Another function of VGAM1338 is therefore inhibition of MGC26651 (Accession NM_144642). Accordingly, utilities of VGAM1338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC26651. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1339 (VGAM1339) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47408] VGAM1339 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1339 was detected is described hereinabove with reference to Figs. 1-8.

[47409] VGAM1339 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus. VGAM1339 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[47410] VGAM1339 gene encodes a VGAM1339 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1339 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1339 precursor RNA is designated SEQ ID:1325, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1325 is located at position 245147 relative to the genome of Fowlpox Virus.

[47411] VGAM1339 precursor RNA folds onto itself, forming VGAM1339 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47412] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1339 folded precursor RNA into VGAM1339 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM1339 RNA is designated SEQ ID:4050, and is provided hereinbelow with reference to the sequence listing part.

[47413] VGAM1339 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1339 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1339 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[47414] VGAM1339 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1339 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1339 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1339 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1339 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[47415] The complementary binding of VGAM1339 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1339 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1339 host target RNA into VGAM1339 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47416] It is appreciated that VGAM1339 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1339 host target genes. The mRNA of each one of this plurality of VGAM1339 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1339 RNA, herein designated VGAM RNA, and which when bound by VGAM1339 RNA causes inhibition of translation of respective one or more VGAM1339 host target proteins.

[47417] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1339 gene, herein designated VGAM GENE, on one or more VGAM1339 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[47418] It is yet further appreciated that a function of VGAM1339 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1339 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM1339 correlate with, and may be deduced from, the identity of the host target genes which VGAM1339 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47419] Nucleotide sequences of the VGAM1339 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1339 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1339 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1339 are further described hereinbelow with reference to Table 1.

[47420] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM1339 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1339 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47421] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1339 gene, herein designated VGAM is inhibition of expression of VGAM1339 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1339 correlate with, and may be deduced from, the identity of the target genes which VGAM1339 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[47422] LOC199725 (Accession XM_117119) is a VGAM1339 host target gene. LOC199725 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC199725, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199725 BINDING SITE, designated SEQ ID:43242, to the nucleotide sequence of VGAM1339 RNA, herein designated VGAM RNA, also designated SEQ ID:4050.

[47423] A function of VGAM1339 is therefore inhibition of LOC199725 (Accession XM_117119). Accordingly, utilities of VGAM1339 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199725. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1340 (VGAM1340) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47424] VGAM1340 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1340 was detected is described hereinabove with reference to Figs. 1-8.

[47425] VGAM1340 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Garlic Virus A. VGAM1340 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47426] VGAM1340 gene encodes a VGAM1340 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM1340 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1340 precursor RNA is designated SEQ ID:1326, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1326 is located at position 7154 relative to the genome of Garlic Virus A.

- [47427] VGAM1340 precursor RNA folds onto itself, forming VGAM1340 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [47428] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1340 folded precursor RNA into VGAM1340 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 71%) nucleotide sequence of VGAM1340 RNA is designated SEQ ID:4051, and is provided hereinbelow with reference to the sequence listing part.

[47429] VGAM1340 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1340 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1340 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[47430] VGAM1340 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1340 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1340 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1340 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1340 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[47431] The complementary binding of VGAM1340 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1340 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1340 host target RNA into VGAM1340 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47432] It is appreciated that VGAM1340 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1340 host target genes. The mRNA of each one of this plurality of VGAM1340 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1340 RNA, herein designated VGAM RNA, and which when bound by VGAM1340 RNA causes inhibition of translation of respective one or more VGAM1340 host target proteins.

[47433] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1340 gene, herein designated VGAM GENE, on one or more VGAM1340 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[47434] It is yet further appreciated that a function of VGAM1340 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1340 include diagnosis, prevention and treatment of viral infection by Garlic Virus A. Specific functions, and accordingly utilities, of VGAM1340 correlate with, and may be deduced from, the identity of the host target genes which VGAM1340 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47435] Nucleotide sequences of the VGAM1340 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1340 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1340 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1340 are further described hereinbelow with reference to Table 1.

[47436] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1340 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1340 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[47437] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1340 gene, herein designated VGAM is inhibition of expression of VGAM1340 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1340 correlate with, and may be deduced from, the identity of the target genes which VGAM1340 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[47438] Glutamate Receptor, Ionotropic, N-methyl D-aspartate 2C (GRIN2C, Accession NM_000835) is a VGAM1340 host target gene. GRIN2C BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GRIN2C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRIN2C BINDING SITE, designated SEQ ID:6493, to the nucleotide sequence of VGAM1340 RNA, herein designated VGAM RNA, also designated SEQ ID:4051.

[47439] A function of VGAM1340 is therefore inhibition of Glutamate Receptor, Ionotropic, N-methyl D-aspartate 2C (GRIN2C, Accession NM_000835), a gene which has effect

on CREB function, gene regulation, and neuronal survival. Accordingly, utilities of VGAM1340 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRIN2C. The function of GRIN2C has been established by previous studies. The NMDA receptors are 1 class of ionotropic glutamate receptors (see OMIM Ref. No. GRIN2D; 602717). By screening a human hippocampal cDNA library with a rat Nr2a (GRIN2A; 138253) cDNA, Lin et al. (1996) isolated cDNAs encoding GRIN2C, called NR2C by them. Northern blot analysis showed that the 4.4-kb GRIN2C mRNA was widely expressed in the brain, with the highest level of expression in the cerebellum; this transcript was also found in several other tissues. An additional, slightly larger, transcript was detected in the cerebellum. The sequence of the deduced 1,233-amino acid protein is 88% identical to those of rat and mouse Nr2c. Hydropathy analysis of GRIN2C predicted a large N terminus, 4 hydrophobic regions, and a large C terminus. Animal model experiments lend further support to the function of GRIN2C. Kadotani et al. (1996) showed that targeted disruption of the mouse Nmdar2c gene produced homozygous $-/-$ mice with no obvious deficiency. By gene targeting, Sprengel et al. (1998) gen-

erated mutant mice expressing the Nmdar2c gene without the large intracellular C-terminal domain. These mice were viable but exhibited deficits in motor coordination. The authors concluded that the observed phenotypes appear to reflect defective intracellular signaling.

[47440] It is appreciated that the abovementioned animal model for GRIN2C is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[47441] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[47442] Kadotani, H.; Hirano, T.; Masugi, M.; Nakamura, K.; Nakao, K.; Katsuki, M.; Nakanishi, S. : Motor discoordination results from combined gene disruption of the NMDA receptor NR2A and NR2C subunits, but not from single disruption of the NR2A or NR2C subunit. J. Neurosci. 16: 7859–7867, 1996. ; and

[47443] Lin, Y. J.; Bovetto, S.; Carver, J. M.; Giordano, T. : Cloning of the cDNA for the human NMDA receptor NR2C subunit and its expression in the central nervous system and periphery. Mole.

[47444] Further studies establishing the function and utilities of

GRIN2C are found in John Hopkins OMIM database record ID 138254, and in cited publications numbered 3598, 11922, 1192 and 3599 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Period Homolog 2 (Drosophila) (PER2, Accession NM_022817) is another VGAM1340 host target gene. PER2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PER2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PER2 BINDING SITE, designated SEQ ID:23092, to the nucleotide sequence of VGAM1340 RNA, herein designated VGAM RNA, also designated SEQ ID:4051.

[47445] Another function of VGAM1340 is therefore inhibition of Period Homolog 2 (Drosophila) (PER2, Accession NM_022817), a gene which Period homolog 2; putative circadian clock protein; has a PAS dimerization domain. Accordingly, utilities of VGAM1340 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PER2. The function of PER2 and its association with various diseases and clinical conditions, has been established by previous studies, as described

hereinabove with reference to VGAM74.TAP Binding Protein (tapasin) (TAPBP, Accession NM_003190) is another VGAM1340 host target gene. TAPBP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TAPBP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TAPBP BINDING SITE, designated SEQ ID:9184, to the nucleotide sequence of VGAM1340 RNA, herein designated VGAM RNA, also designated SEQ ID:4051.

[47446] Another function of VGAM1340 is therefore inhibition of TAP Binding Protein (tapasin) (TAPBP, Accession NM_003190), a gene which is involved in MHC class I-restricted antigen processing. Accordingly, utilities of VGAM1340 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAPBP. The function of TAPBP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM122.Chromosome 20 Open Reading Frame 21 (C20orf21, Accession NM_017798) is another VGAM1340 host target gene. C20orf21 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by C20orf21, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf21 BINDING SITE, designated SEQ ID:19440, to the nucleotide sequence of VGAM1340 RNA, herein designated VGAM RNA, also designated SEQ ID:4051.

[47447] Another function of VGAM1340 is therefore inhibition of Chromosome 20 Open Reading Frame 21 (C20orf21, Accession NM_017798). Accordingly, utilities of VGAM1340 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf21.

FLJ10535 (Accession NM_018129) is another VGAM1340 host target gene. FLJ10535 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10535, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10535 BINDING SITE, designated SEQ ID:19920, to the nucleotide sequence of VGAM1340 RNA, herein designated VGAM RNA, also designated SEQ ID:4051.

[47448] Another function of VGAM1340 is therefore inhibition of FLJ10535 (Accession NM_018129). Accordingly, utilities of VGAM1340 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10535. FLJ10687 (Accession NM_018178) is another VGAM1340 host target gene. FLJ10687 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10687, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10687 BINDING SITE, designated SEQ ID:20010, to the nucleotide sequence of VGAM1340 RNA, herein designated VGAM RNA, also designated SEQ ID:4051.

[47449] Another function of VGAM1340 is therefore inhibition of FLJ10687 (Accession NM_018178). Accordingly, utilities of VGAM1340 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10687. KIAA0350 (Accession XM_028332) is another VGAM1340 host target gene. KIAA0350 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0350, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0350 BINDING SITE, designated SEQ ID:30672, to the nucleotide sequence of VGAM1340 RNA, herein designated VGAM RNA, also designated SEQ ID:4051.

[47450] Another function of VGAM1340 is therefore inhibition of KIAA0350 (Accession XM_028332). Accordingly, utilities of VGAM1340 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0350. LEAP-2 (Accession NM_052971) is another VGAM1340 host target gene. LEAP-2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LEAP-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LEAP-2 BINDING SITE, designated SEQ ID:27543, to the nucleotide sequence of VGAM1340 RNA, herein designated VGAM RNA, also designated SEQ ID:4051.

[47451] Another function of VGAM1340 is therefore inhibition of LEAP-2 (Accession NM_052971). Accordingly, utilities of VGAM1340 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LEAP-2.

LOC148534 (Accession XM_086222) is another VGAM1340 host target gene. LOC148534 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148534, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148534 BINDING SITE, designated SEQ ID:38547, to the nucleotide sequence of VGAM1340 RNA, herein designated VGAM RNA, also designated SEQ ID:4051.

[47452] Another function of VGAM1340 is therefore inhibition of LOC148534 (Accession XM_086222). Accordingly, utilities of VGAM1340 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148534. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1341 (VGAM1341) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47453] VGAM1341 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1341 was detected is described hereinabove with reference to Figs. 1–8.

[47454] VGAM1341 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Garlic Virus A.

VGAM1341 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47455] VGAM1341 gene encodes a VGAM1341 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1341 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1341 precursor RNA is designated SEQ ID:1327, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1327 is located at position 6737 relative to the genome of Garlic Virus A.

[47456] VGAM1341 precursor RNA folds onto itself, forming VGAM1341 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide

sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47457] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1341 folded precursor RNA into VGAM1341 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1341 RNA is designated SEQ ID:4052, and is provided hereinbelow with reference to the sequence listing part.

[47458] VGAM1341 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1341 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1341 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[47459] VGAM1341 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1341 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1341 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1341 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1341 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[47460] The complementary binding of VGAM1341 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1341 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1341 host target RNA into VGAM1341 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47461] It is appreciated that VGAM1341 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1341 host target genes. The mRNA of each one of this plurality of VGAM1341 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1341 RNA, herein designated VGAM RNA, and which when bound by VGAM1341 RNA causes inhibition of translation of respective one or more VGAM1341 host target proteins.

[47462] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1341 gene, herein designated VGAM GENE, on one or more VGAM1341 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[47463] It is yet further appreciated that a function of VGAM1341 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1341 include diagnosis, prevention and treatment of viral infection by Garlic Virus A. Specific functions, and accordingly utilities, of VGAM1341 correlate with, and may be deduced from, the identity of the host target genes which VGAM1341 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47464] Nucleotide sequences of the VGAM1341 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1341 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM1341 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1341 are further described hereinbelow with reference to Table 1.

[47465] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1341 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1341 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47466] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1341 gene, herein designated VGAM is inhibition of expression of VGAM1341 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1341 correlate with, and may be deduced from, the identity of the target genes which VGAM1341 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[47467] Aryl Hydrocarbon Receptor (AHR, Accession NM_001621) is a VGAM1341 host target gene. AHR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AHR, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AHR BINDING SITE, designated SEQ ID:7333, to the nucleotide sequence of VGAM1341 RNA, herein designated VGAM RNA, also designated SEQ ID:4052.

[47468] A function of VGAM1341 is therefore inhibition of Aryl Hydrocarbon Receptor (AHR, Accession NM_001621), a gene which plays a role in modulating carcinogenesis through the induction of xenobiotic-metabolizing enzymes. Accordingly, utilities of VGAM1341 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AHR. The function of AHR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM368. Carbonic Anhydrase XII (CA12, Accession NM_001218) is another VGAM1341 host target gene. CA12 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CA12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CA12 BINDING SITE,

designated SEQ ID:6879, to the nucleotide sequence of VGAM1341 RNA, herein designated VGAM RNA, also designated SEQ ID:4052.

[47469] Another function of VGAM1341 is therefore inhibition of Carbonic Anhydrase XII (CA12, Accession NM_001218), a gene which functions in cellular transport and metabolic processes. Accordingly, utilities of VGAM1341 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CA12. The function of CA12 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM508. Cell Adhesion Molecule with Homology to L1CAM (close homolog of L1) (CHL1, Accession NM_006614) is another VGAM1341 host target gene. CHL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CHL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHL1 BINDING SITE, designated SEQ ID:13394, to the nucleotide sequence of VGAM1341 RNA, herein designated VGAM RNA, also designated SEQ ID:4052.

[47470] Another function of VGAM1341 is therefore inhibition of Cell Adhesion Molecule with Homology to L1CAM (close homolog of L1) (CHL1, Accession NM_006614). Accordingly, utilities of VGAM1341 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHL1. KIAA1190 (Accession XM_048695) is another VGAM1341 host target gene. KIAA1190 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1190, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1190 BINDING SITE, designated SEQ ID:35226, to the nucleotide sequence of VGAM1341 RNA, herein designated VGAM RNA, also designated SEQ ID:4052.

[47471] Another function of VGAM1341 is therefore inhibition of KIAA1190 (Accession XM_048695). Accordingly, utilities of VGAM1341 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1190. PRO1386 (Accession NM_031269) is another VGAM1341 host target gene. PRO1386 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRO1386, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1386 BINDING SITE, designated SEQ ID:25286, to the nucleotide sequence of VGAM1341 RNA, herein designated VGAM RNA, also designated SEQ ID:4052.

[47472] Another function of VGAM1341 is therefore inhibition of PRO1386 (Accession NM_031269). Accordingly, utilities of VGAM1341 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1386. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1342 (VGAM1342) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47473] VGAM1342 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1342 was detected is described hereinabove with reference to Figs. 1-8.

[47474] VGAM1342 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Garlic Virus A.

VGAM1342 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47475] VGAM1342 gene encodes a VGAM1342 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1342 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1342 precursor RNA is designated SEQ ID:1328, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1328 is located at position 2936 relative to the genome of Garlic Virus A.

[47476] VGAM1342 precursor RNA folds onto itself, forming VGAM1342 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47477] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM1342 folded precursor RNA into VGAM1342 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of VGAM1342 RNA is designated SEQ ID:4053, and is provided hereinbelow with reference to the sequence listing part.

[47478] VGAM1342 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1342 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1342 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[47479] VGAM1342 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1342 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1342 RNA is an accurate or a partial inversed–reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1342 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1342 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[47480] The complementary binding of VGAM1342 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1342 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1342 host target RNA into VGAM1342 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47481] It is appreciated that VGAM1342 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1342 host target genes. The mRNA of each one of this plurality of VGAM1342 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1342 RNA, herein designated VGAM RNA, and which when bound by VGAM1342 RNA causes inhibition of translation of respective one or more VGAM1342 host target proteins.

[47482] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1342 gene, herein designated VGAM GENE, on one or more VGAM1342 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[47483] It is yet further appreciated that a function of VGAM1342 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1342 include diagnosis, prevention and treatment of viral infection by Garlic Virus A. Specific functions, and accordingly utilities, of VGAM1342 correlate with, and may be deduced from, the identity of the host target genes which VGAM1342 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47484] Nucleotide sequences of the VGAM1342 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1342 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1342 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1342 are further described hereinbelow with reference to Table 1.

[47485] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1342 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1342 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47486] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1342 gene, herein designated VGAM is inhibition of expression of VGAM1342 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1342 correlate with, and may be deduced from, the identity of the target genes which VGAM1342 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[47487] Cadherin 5, Type 2, VE-cadherin (vascular epithelium) (CDH5, Accession NM_001795) is a VGAM1342 host target gene. CDH5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CDH5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDH5 BINDING SITE, designated SEQ ID:7548,

to the nucleotide sequence of VGAM1342 RNA, herein designated VGAM RNA, also designated SEQ ID:4053.

[47488] A function of VGAM1342 is therefore inhibition of Cadherin 5, Type 2, VE-cadherin (vascular epithelium) (CDH5, Accession NM_001795), a gene which associates with alpha-catenin forming a link to the cytoskeleton. Accordingly, utilities of VGAM1342 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDH5. The function of CDH5 has been established by previous studies. Cadherins are calcium-dependent adhesive proteins that mediate cell-to-cell interaction. Huber et al. (1996) noted that they constitute an expanding family of receptors involved in the structural and functional organization of cells in various tissues. Members of the family include epithelial cadherin (E-cadherin; 192090), neural cadherin (N-cadherin; 114020), placental cadherin (P-cadherin; 114021), muscle cadherin (M-cadherin; 114019), and vascular endothelial cadherin (VE-cadherin, or CDH5). They share a common domain structure and primary sequence homologies. Each cadherin type has a unique tissue-distribution pattern. In most of them, expression is not restricted to 1 cell type, and more than 1 cadherin type may be found at the sur-

face of a particular cell. The authors stated that endothelial cells have been shown to express N-cadherin, VE-cadherin, and to a lesser extent, P-cadherin. Among these, only VE-cadherin is expressed specifically in endothelial cells (Salomon et al., 1992). Furthermore, VE-cadherin is associated consistently with intercellular junctions, whereas N-cadherin remains diffuse on the cell membrane. In order to define the role of CDH5 and of its binding to beta-catenin (see OMIM Ref. No. 116806) in intracellular signaling, Carmeliet et al. (1999) generated mice that lacked a functional Cdh5 gene, that expressed a mutant Cdh5 gene lacking the beta-catenin-binding cytoplasmic tail, or that did not express detectable Cdh5 levels because of an intronic neomycin phosphotransferase (neo) gene. They found in all of these mice that deletion or truncation of the Cdh5 gene did not affect assembly of endothelial cells in vascular plexi, but did impair their subsequent remodeling and maturation, causing lethality at 9.5 days of gestation. Deficiency or truncation of Cdh5 induced endothelial apoptosis and abolished transmission of the endothelial survival signal by vascular endothelial growth factor A (VEGF; 192240) to AKT kinase (OMIM Ref. No. 164730) and BCL2 (OMIM Ref. No. 151430) via re-

duced complex formation with VEGF receptor-2 (OMIM Ref. No. 191306), beta-catenin, and phosphoinositide-3 kinase (see OMIM Ref. No. 171833). Thus, Carmeliet et al. (1999) concluded that CDH5/beta-catenin signaling controls endothelial survival.

[47489] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[47490] Carmeliet, P.; Lampugnani, M.-G.; Moons, L.; Breviario, F.; Compernelle, V.; Bono, F.; Balconi, G.; Spagnuolo, R.; Oosthuysen, B.; Dewerchin, M.; Zanetti, A.; Angellilo, A.; and 11 others : Targeted deficiency of cytosolic truncation of the VE-cadherin gene in mice impairs VEGF-mediated endothelial survival and angiogenesis. Cell 98: 147-157, 1999. ; and

[47491] Huber, P.; Dalmon, J.; Engiles, J.; Breviario, F.; Gory, S.; Siracusa, L. D.; Buchberg, A. M.; Dejana, E. : Genomic structure and chromosomal mapping of the mouse VE-cadherin gene (Cdh5.

[47492] Further studies establishing the function and utilities of CDH5 are found in John Hopkins OMIM database record ID 601120, and in cited publications numbered 6362-636 and 11646 listed in the bibliography section hereinbelow,

which are also hereby incorporated by reference. Polycystic Kidney and Hepatic Disease 1 (autosomal recessive) (PKHD1, Accession NM_138694) is another VGAM1342 host target gene. PKHD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PKHD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PKHD1 BINDING SITE, designated SEQ ID:28942, to the nucleotide sequence of VGAM1342 RNA, herein designated VGAM RNA, also designated SEQ ID:4053.

[47493] Another function of VGAM1342 is therefore inhibition of Polycystic Kidney and Hepatic Disease 1 (autosomal recessive) (PKHD1, Accession NM_138694). Accordingly, utilities of VGAM1342 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PKHD1. RAB5A, Member RAS Oncogene Family (RAB5A, Accession NM_004162) is another VGAM1342 host target gene. RAB5A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAB5A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB5A BINDING SITE, designated SEQ ID:10371, to the nucleotide sequence of VGAM1342 RNA, herein designated VGAM RNA, also designated SEQ ID:4053.

[47494] Another function of VGAM1342 is therefore inhibition of RAB5A, Member RAS Oncogene Family (RAB5A, Accession NM_004162), a gene which is a rate-limiting component of the machinery regulating the kinetics of membrane traffic. Accordingly, utilities of VGAM1342 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB5A. The function of RAB5A has been established by previous studies. The *S. cerevisiae* YPT1 and SEC4 genes encode Ras-related GTP-binding proteins involved in the regulation of secretion. Mammalian cells express a large number of RAB proteins, GTP-binding proteins closely related to YPT1 and SEC4. By screening a human pheochromocytoma library with probes derived from the SEC4 gene and from various rat and human RAB cDNAs, Zahraoui et al. (1989) isolated cDNAs encoding RAB1 (OMIM Ref. No. 179508), RAB2 (OMIM Ref. No. 179509), RAB3A (OMIM Ref. No. 179490), RAB3B (OMIM Ref. No. 179510), RAB4 (OMIM Ref. No.

179511), RAB5, and RAB6 (OMIM Ref. No. 179513). Except for the closely related RAB3A and RAB3B, the deduced human RAB proteins share 32 to 50% homology. The predicted 214-amino acid RAB5 protein is 31% and 38% identical to SEC4 and YPT1, respectively. All 6 human RAB proteins tested bound GTP and exhibited GTPase activities in vitro. Northern blot analysis revealed that RAB5 was expressed as 2.7- and 2.8-kb mRNAs in a human fibroblast cell line. Bucci et al. (1992) demonstrated that RAB5 is a rate-limiting component of the machinery regulating the kinetics of membrane traffic in the early endocytic pathway. Stenmark et al. (1995) reported that rabaptin-5 (OMIM Ref. No. 603616) is an effector of RAB5 that transmits the signal of the active GTP-bound RAB5 conformation to the membrane docking and/or fusion apparatus. Xiao et al. (1997) found that tuberin (OMIM Ref. No. 191092) exhibits substantial GTPase-activating protein (GAP) activity towards RAB5, and that rabaptin-5 mediates the tuberin association with RAB5. The authors suggested that tuberin functions as a RAB5GAP in vivo to negatively regulate RAB5-GTP activity in endocytosis.

[47495] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [47496] Bucci, C.; Parton, R. G.; Mather, I. H.; Stunnenberg, H.; Simons, K.; Hoflack, B.; Zerial, M. : The small GTPase rab5 functions as a regulatory factor in the early endocytic pathway. Cell 70: 715–728, 1992. ; and
- [47497] Xiao, G.–H.; Shoarinejad, F.; Jin, F.; Golemis, E. A.; Yeung, R. S. : The tuberous sclerosis 2 gene product, tuberin, functions as a Rab5 GTPase activating protein (GAP) in modulating en.
- [47498] Further studies establishing the function and utilities of RAB5A are found in John Hopkins OMIM database record ID 179512, and in cited publications numbered 2542, 2539, 2543–254 and 2722 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. DKFZp761K1423 (Accession NM_018422) is another VGAM1342 host target gene. DKFZp761K1423 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZp761K1423, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761K1423 BINDING SITE, designated SEQ ID:20471, to the nucleotide sequence of

VGAM1342 RNA, herein designated VGAM RNA, also designated SEQ ID:4053.

[47499] Another function of VGAM1342 is therefore inhibition of DKFZp761K1423 (Accession NM_018422). Accordingly, utilities of VGAM1342 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761K1423. Hairy/enhancer-of-split Related with YRPW Motif-like (HEYL, Accession NM_014571) is another VGAM1342 host target gene. HEYL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HEYL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HEYL BINDING SITE, designated SEQ ID:15929, to the nucleotide sequence of VGAM1342 RNA, herein designated VGAM RNA, also designated SEQ ID:4053.

[47500] Another function of VGAM1342 is therefore inhibition of Hairy/enhancer-of-split Related with YRPW Motif-like (HEYL, Accession NM_014571). Accordingly, utilities of VGAM1342 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HEYL. KIAA0418 (Accession NM_014631) is another VGAM1342

host target gene. KIAA0418 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0418, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0418 BINDING SITE, designated SEQ ID:15997, to the nucleotide sequence of VGAM1342 RNA, herein designated VGAM RNA, also designated SEQ ID:4053.

[47501] Another function of VGAM1342 is therefore inhibition of KIAA0418 (Accession NM_014631). Accordingly, utilities of VGAM1342 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0418. KIAA1247 (Accession XM_030036) is another VGAM1342 host target gene. KIAA1247 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1247, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1247 BINDING SITE, designated SEQ ID:30989, to the nucleotide sequence of VGAM1342 RNA, herein designated VGAM RNA, also designated SEQ ID:4053.

[47502] Another function of VGAM1342 is therefore inhibition of KIAA1247 (Accession XM_030036). Accordingly, utilities of VGAM1342 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1247. KIAA1701 (Accession XM_042087) is another VGAM1342 host target gene. KIAA1701 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1701, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1701 BINDING SITE, designated SEQ ID:33684, to the nucleotide sequence of VGAM1342 RNA, herein designated VGAM RNA, also designated SEQ ID:4053.

[47503] Another function of VGAM1342 is therefore inhibition of KIAA1701 (Accession XM_042087). Accordingly, utilities of VGAM1342 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1701. Mab-21-like 2 (C. elegans) (MAB21L2, Accession NM_006439) is another VGAM1342 host target gene. MAB21L2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MAB21L2, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAB21L2 BINDING SITE, designated SEQ ID:13149, to the nucleotide sequence of VGAM1342 RNA, herein designated VGAM RNA, also designated SEQ ID:4053.

[47504] Another function of VGAM1342 is therefore inhibition of Mab-21-like 2 (*C. elegans*) (MAB21L2, Accession NM_006439). Accordingly, utilities of VGAM1342 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAB21L2. MDS028 (Accession NM_018463) is another VGAM1342 host target gene. MDS028 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MDS028, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MDS028 BINDING SITE, designated SEQ ID:20534, to the nucleotide sequence of VGAM1342 RNA, herein designated VGAM RNA, also designated SEQ ID:4053.

[47505] Another function of VGAM1342 is therefore inhibition of MDS028 (Accession NM_018463). Accordingly, utilities of

VGAM1342 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MDS028. PRO2012 (Accession NM_018614) is another VGAM1342 host target gene. PRO2012 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRO2012, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2012 BINDING SITE, designated SEQ ID:20681, to the nucleotide sequence of VGAM1342 RNA, herein designated VGAM RNA, also designated SEQ ID:4053.

[47506] Another function of VGAM1342 is therefore inhibition of PRO2012 (Accession NM_018614). Accordingly, utilities of VGAM1342 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2012. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1343 (VGAM1343) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47507] VGAM1343 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1343 was detected is described hereinabove with reference to Figs. 1–8.

[47508] VGAM1343 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Garlic Virus A. VGAM1343 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47509] VGAM1343 gene encodes a VGAM1343 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1343 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1343 precursor RNA is designated SEQ ID:1329, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1329 is located at position 1501 relative to the genome of Garlic Virus A.

[47510] VGAM1343 precursor RNA folds onto itself, forming VGAM1343 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47511] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1343 folded precursor RNA into VGAM1343 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 54%) nucleotide sequence of VGAM1343 RNA is designated SEQ ID:4054, and is provided hereinbelow with reference to the sequence listing part.

[47512] VGAM1343 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1343 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1343 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[47513] VGAM1343 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1343 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1343 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1343 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1343 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[47514] The complementary binding of VGAM1343 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1343 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1343 host target RNA into VGAM1343 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47515] It is appreciated that VGAM1343 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1343 host target genes. The mRNA of each one of this plurality of VGAM1343 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1343 RNA, herein designated VGAM RNA, and which when bound by VGAM1343 RNA causes inhibition of translation of respective one or more VGAM1343 host target proteins.

[47516] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1343 gene, herein designated VGAM GENE, on one or more VGAM1343 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[47517] It is yet further appreciated that a function of VGAM1343 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1343 include diagnosis, prevention and treatment of viral infection by Garlic Virus A. Specific functions, and accordingly utilities, of VGAM1343 correlate with, and may be deduced from, the identity of the host target genes which VGAM1343 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47518] Nucleotide sequences of the VGAM1343 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the
`diced` VGAM1343 RNA, herein designated VGAM RNA,
and a schematic representation of the secondary folding
of VGAM1343 folded precursor RNA, herein designated
VGAM FOLDED PRECURSOR RNA, of VGAM1343 are further
described hereinbelow with reference to Table 1.

[47519] Nucleotide sequences of host target binding sites, such as
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of
Fig. 1, found on VGAM1343 host target RNA, and
schematic representation of the complementarity of each
of these host target binding sites to VGAM1343 RNA,
herein designated VGAM RNA, are described hereinbelow
with reference to Table 2.

[47520] As mentioned hereinabove with reference to Fig. 1, a
function of VGAM1343 gene, herein designated VGAM is
inhibition of expression of VGAM1343 target genes. It is
appreciated that specific functions, and accordingly utili-
ties, of VGAM1343 correlate with, and may be deduced
from, the identity of the target genes which VGAM1343
binds and inhibits, and the function of these target genes,
as elaborated hereinbelow.

[47521] CD22 Antigen (CD22, Accession NM_001771) is a
VGAM1343 host target gene. CD22 BINDING SITE is HOST

TARGET binding site found in the 3' untranslated region of mRNA encoded by CD22, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CD22 BINDING SITE, designated SEQ ID:7531, to the nucleotide sequence of VGAM1343 RNA, herein designated VGAM RNA, also designated SEQ ID:4054.

[47522] A function of VGAM1343 is therefore inhibition of CD22 Antigen (CD22, Accession NM_001771), a gene which is an antigen expressed specifically in B lymphocytes (Cd22 antigen) and may act in cell-cell interactions. Accordingly, utilities of VGAM1343 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD22. The function of CD22 has been established by previous studies. Nonhuman mammalian cells express N-acetylneuraminic acid (OMIM Ref. No. Neu5Ac) and N-glycolylneuraminic acid (OMIM Ref. No. Neu5Gc). Human cells contain only Neu5Ac because of an exon deletion/frameshift mutation in cytidine monophospho-sialic acid hydroxylase (CMAH; 603209), which converts Neu5Ac to Neu5Gc. Sialic acid-binding immunoglobulin-like lectins, or SIGLECs, such as CD22 (SIGLEC2), recognize sialic

acids. Brinkman–Van der Linden et al. (2000) showed that human SIGLEC1 (SN; 600751) strongly prefers Neu5Ac over Neu5Gc. Sequence analysis of SIGLEC2 cDNA found that while the chimpanzee sequence is 97% homologous to human, bonobo and gorilla are only 96% homologous, and the orangutan is only 93% homologous. Using regions of SIGLEC2 proteins from mouse, chimpanzee, orangutan, and human fused to the Fc region of human IgG, and flow cytometry analysis, Brinkman–Van der Linden et al. (2000) showed that all bound well to chimpanzee Epstein–Barr virus (EBV)–transformed B cells, which expressed high levels of Neu5Gc. Except for mouse, all bound well to human EBV–transformed B cells, which expressed high levels of Neu5Ac. Animal model experiments lend further support to the function of CD22. O'Keefe et al. (1996) made observations in mice with a targeted disruption of the CD22 gene indicating that CD22 is a negative regulator of antigen receptor signaling whose onset of expression at the mature B cell stage may serve to raise the antigen concentration threshold required for B cell triggering. Splenic B cells from CD22 knockout mice were found to be hyperresponsive to receptor signaling. Heightened calcium fluxes and cell proliferation were obtained at lower ligand con-

centrations. The mice gave augmented immune response, had an expanded peritoneal B-1 cell population, and contained increased serum titers of autoantibody.

[47523] It is appreciated that the abovementioned animal model for CD22 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[47524] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[47525] O'Keefe, T. L.; Williams, G. T.; Davies, S. L.; Neuberger, M. S. : Hyperresponsive B cells in CD22-deficient mice. Science 274: 798-801, 1996. ; and

[47526] Brinkman-Van der Linden, E. C. M.; Sjoberg, E. R.; Juneja, L. R.; Crocker, P. R.; Varki, N.; Varki, A. : Loss of N-glycolylneuraminic acid in human evolution: implications for sialic aci.

[47527] Further studies establishing the function and utilities of CD22 are found in John Hopkins OMIM database record ID 107266, and in cited publications numbered 206-20 and 2959-209 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Dachshund Homolog (Drosophila) (DACH, Accession

NM_080759) is another VGAM1343 host target gene.

DACH BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DACH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DACH BINDING SITE, designated SEQ ID:28033, to the nucleotide sequence of VGAM1343 RNA, herein designated VGAM RNA, also designated SEQ ID:4054.

[47528] Another function of VGAM1343 is therefore inhibition of Dachshund Homolog (Drosophila) (DACH, Accession NM_080759), a gene which regulates early progenitor cell proliferation during retinogenesis and pituitary development . Accordingly, utilities of VGAM1343 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DACH. The function of DACH and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM260. Heme Oxygenase (decycling) 1 (HMOX1, Accession NM_002133) is another VGAM1343 host target gene. HMOX1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HMOX1, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HMOX1 BINDING SITE, designated SEQ ID:7908, to the nucleotide sequence of VGAM1343 RNA, herein designated VGAM RNA, also designated SEQ ID:4054.

[47529] Another function of VGAM1343 is therefore inhibition of Heme Oxygenase (decycling) 1 (HMOX1, Accession NM_002133). Accordingly, utilities of VGAM1343 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HMOX1. PCCX2 (Accession XM_038352) is another VGAM1343 host target gene. PCCX2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCCX2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCCX2 BINDING SITE, designated SEQ ID:32821, to the nucleotide sequence of VGAM1343 RNA, herein designated VGAM RNA, also designated SEQ ID:4054.

[47530] Another function of VGAM1343 is therefore inhibition of PCCX2 (Accession XM_038352). Accordingly, utilities of

VGAM1343 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCCX2. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1344 (VGAM1344) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47531] VGAM1344 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1344 was detected is described hereinabove with reference to Figs. 1–8.

[47532] VGAM1344 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Macaca Mulatta Rhadinovirus. VGAM1344 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47533] VGAM1344 gene encodes a VGAM1344 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1344 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1344 precursor RNA is desig-

nated SEQ ID:1330, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1330 is located at position 128312 relative to the genome of Macaca Mulatta Rhadinovirus.

- [47534] VGAM1344 precursor RNA folds onto itself, forming VGAM1344 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [47535] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1344 folded precursor RNA into VGAM1344 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of VGAM1344 RNA is designated SEQ ID:4055, and is provided hereinbelow with reference to the sequence

listing part.

[47536] VGAM1344 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1344 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1344 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[47537] VGAM1344 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1344 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1344 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1344 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM1344 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[47538] The complementary binding of VGAM1344 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1344 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1344 host target RNA into VGAM1344 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47539] It is appreciated that VGAM1344 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1344 host target genes. The mRNA of each one of this plurality of VGAM1344 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1344 RNA, herein designated VGAM

RNA, and which when bound by VGAM1344 RNA causes inhibition of translation of respective one or more VGAM1344 host target proteins.

[47540] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1344 gene, herein designated VGAM GENE, on one or more VGAM1344 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[47541] It is yet further appreciated that a function of VGAM1344 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1344 include diagnosis, prevention and treatment of viral infection by Macaca Mulatta Rhadinovirus. Specific functions, and accordingly utilities, of VGAM1344 correlate with, and may be deduced from, the identity of the host target genes which VGAM1344 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47542] Nucleotide sequences of the VGAM1344 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1344 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1344 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1344 are further described hereinbelow with reference to Table 1.

[47543] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1344 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1344 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47544] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1344 gene, herein designated VGAM is

inhibition of expression of VGAM1344 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1344 correlate with, and may be deduced from, the identity of the target genes which VGAM1344 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[47545] MOT8 (Accession NM_018836) is a VGAM1344 host target gene. MOT8 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MOT8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MOT8 BINDING SITE, designated SEQ ID:20825, to the nucleotide sequence of VGAM1344 RNA, herein designated VGAM RNA, also designated SEQ ID:4055.

[47546] A function of VGAM1344 is therefore inhibition of MOT8 (Accession NM_018836). Accordingly, utilities of VGAM1344 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MOT8. Toll-like Receptor 10 (TLR10, Accession NM_030956) is another VGAM1344 host target gene. TLR10 BINDING SITE is HOST TARGET binding site found in the 5' untranslated

region of mRNA encoded by TLR10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TLR10 BINDING SITE, designated SEQ ID:25229, to the nucleotide sequence of VGAM1344 RNA, herein designated VGAM RNA, also designated SEQ ID:4055.

[47547] Another function of VGAM1344 is therefore inhibition of Toll-like Receptor 10 (TLR10, Accession NM_030956). Accordingly, utilities of VGAM1344 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TLR10. YAP (Accession NM_139121) is another VGAM1344 host target gene. YAP BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by YAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of YAP BINDING SITE, designated SEQ ID:29153, to the nucleotide sequence of VGAM1344 RNA, herein designated VGAM RNA, also designated SEQ ID:4055.

[47548] Another function of VGAM1344 is therefore inhibition of YAP (Accession NM_139121). Accordingly, utilities of

VGAM1344 include diagnosis, prevention and treatment of diseases and clinical conditions associated with YAP.

Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1345 (VGAM1345) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47549] VGAM1345 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1345 was detected is described hereinabove with reference to Figs. 1–8.

[47550] VGAM1345 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Herpesvirus 1. VGAM1345 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47551] VGAM1345 gene encodes a VGAM1345 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1345 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1345 precursor RNA is desig-

nated SEQ ID:1331, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1331 is located at position 123564 relative to the genome of Bovine Herpesvirus 1.

- [47552] VGAM1345 precursor RNA folds onto itself, forming VGAM1345 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [47553] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1345 folded precursor RNA into VGAM1345 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM1345 RNA is designated SEQ ID:4056, and is provided hereinbelow with reference to the sequence

listing part.

[47554] VGAM1345 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1345 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1345 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[47555] VGAM1345 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1345 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1345 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1345 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM1345 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[47556] The complementary binding of VGAM1345 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1345 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1345 host target RNA into VGAM1345 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47557] It is appreciated that VGAM1345 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1345 host target genes. The mRNA of each one of this plurality of VGAM1345 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1345 RNA, herein designated VGAM

RNA, and which when bound by VGAM1345 RNA causes inhibition of translation of respective one or more VGAM1345 host target proteins.

[47558] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1345 gene, herein designated VGAM GENE, on one or more VGAM1345 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[47559] It is yet further appreciated that a function of VGAM1345 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1345 include diagnosis, prevention and treatment of viral infection by Bovine Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1345 correlate with, and may be deduced from, the identity of the host target genes which VGAM1345 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47560] Nucleotide sequences of the VGAM1345 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1345 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1345 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1345 are further described hereinbelow with reference to Table 1.

[47561] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1345 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1345 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47562] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1345 gene, herein designated VGAM is

inhibition of expression of VGAM1345 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1345 correlate with, and may be deduced from, the identity of the target genes which VGAM1345 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[47563] V-abl Abelson Murine Leukemia Viral Oncogene Homolog 1 (ABL1, Accession NM_007313) is a VGAM1345 host target gene. ABL1 BINDING SITE1 and ABL1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ABL1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABL1 BINDING SITE1 and ABL1 BINDING SITE2, designated SEQ ID:14228 and SEQ ID:11640 respectively, to the nucleotide sequence of VGAM1345 RNA, herein designated VGAM RNA, also designated SEQ ID:4056.

[47564] A function of VGAM1345 is therefore inhibition of V-abl Abelson Murine Leukemia Viral Oncogene Homolog 1 (ABL1, Accession NM_007313). Accordingly, utilities of VGAM1345 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABL1.

Ems1 Sequence (mammary tumor and squamous cell carcinoma-associated (p80/85 src substrate) (EMS1, Accession NM_138565) is another VGAM1345 host target gene. EMS1 BINDING SITE1 and EMS1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by EMS1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EMS1 BINDING SITE1 and EMS1 BINDING SITE2, designated SEQ ID:28866 and SEQ ID:11735 respectively, to the nucleotide sequence of VGAM1345 RNA, herein designated VGAM RNA, also designated SEQ ID:4056.

[47565] Another function of VGAM1345 is therefore inhibition of Ems1 Sequence (mammary tumor and squamous cell carcinoma-associated (p80/85 src substrate) (EMS1, Accession NM_138565), a gene which may contribute to the organization of cell structure. in transformed cells may contribute to cellular growth regulation and transformation. Accordingly, utilities of VGAM1345 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EMS1. The function of EMS1 and its association with various diseases and clinical conditions,

has been established by previous studies, as described hereinabove with reference to VGAM497.PACE (Accession NM_002569) is another VGAM1345 host target gene. PACE BINDING SITE1 and PACE BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PACE, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PACE BINDING SITE1 and PACE BINDING SITE2, designated SEQ ID:8423 and SEQ ID:8425 respectively, to the nucleotide sequence of VGAM1345 RNA, herein designated VGAM RNA, also designated SEQ ID:4056.

[47566] Another function of VGAM1345 is therefore inhibition of PACE (Accession NM_002569), a gene which processes pro-parathyroid hormone, pro-transforming growth factor beta. Accordingly, utilities of VGAM1345 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PACE. The function of PACE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM151.Syntaxin Binding Protein 1 (STXBP1, Accession NM_003165) is an-

other VGAM1345 host target gene. STXBP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STXBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STXBP1 BINDING SITE, designated SEQ ID:9144, to the nucleotide sequence of VGAM1345 RNA, herein designated VGAM RNA, also designated SEQ ID:4056.

[47567] Another function of VGAM1345 is therefore inhibition of Syntaxin Binding Protein 1 (STXBP1, Accession NM_003165), a gene which may play a role in determining the specificity of intracellular fusion reactions. Accordingly, utilities of VGAM1345 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STXBP1. The function of STXBP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM708.Reserved (C8orf13, Accession XM_088377) is another VGAM1345 host target gene. C8orf13 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C8orf13, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C8orf13 BINDING SITE, designated SEQ ID:39658, to the nucleotide sequence of VGAM1345 RNA, herein designated VGAM RNA, also designated SEQ ID:4056.

[47568] Another function of VGAM1345 is therefore inhibition of Reserved (C8orf13, Accession XM_088377). Accordingly, utilities of VGAM1345 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C8orf13. FLJ12442 (Accession NM_022908) is another VGAM1345 host target gene. FLJ12442 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ12442, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12442 BINDING SITE, designated SEQ ID:23209, to the nucleotide sequence of VGAM1345 RNA, herein designated VGAM RNA, also designated SEQ ID:4056.

[47569] Another function of VGAM1345 is therefore inhibition of FLJ12442 (Accession NM_022908). Accordingly, utilities of VGAM1345 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ12442. FLJ21032 (Accession NM_024906) is another VGAM1345 host target gene. FLJ21032 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ21032, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21032 BINDING SITE, designated SEQ ID:24396, to the nucleotide sequence of VGAM1345 RNA, herein designated VGAM RNA, also designated SEQ ID:4056.

[47570] Another function of VGAM1345 is therefore inhibition of FLJ21032 (Accession NM_024906). Accordingly, utilities of VGAM1345 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21032. FLJ21432 (Accession NM_024551) is another VGAM1345 host target gene. FLJ21432 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21432, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21432 BINDING SITE, designated SEQ ID:23770, to the nucleotide

sequence of VGAM1345 RNA, herein designated VGAM RNA, also designated SEQ ID:4056.

[47571] Another function of VGAM1345 is therefore inhibition of FLJ21432 (Accession NM_024551). Accordingly, utilities of VGAM1345 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21432. JM4 (Accession NM_007213) is another VGAM1345 host target gene. JM4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by JM4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JM4 BINDING SITE, designated SEQ ID:14078, to the nucleotide sequence of VGAM1345 RNA, herein designated VGAM RNA, also designated SEQ ID:4056.

[47572] Another function of VGAM1345 is therefore inhibition of JM4 (Accession NM_007213). Accordingly, utilities of VGAM1345 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JM4. KIAA0984 (Accession XM_037557) is another VGAM1345 host target gene. KIAA0984 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA

encoded by KIAA0984, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0984 BINDING SITE, designated SEQ ID:32643, to the nucleotide sequence of VGAM1345 RNA, herein designated VGAM RNA, also designated SEQ ID:4056.

[47573] Another function of VGAM1345 is therefore inhibition of KIAA0984 (Accession XM_037557). Accordingly, utilities of VGAM1345 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0984. KIAA1463 (Accession XM_051160) is another VGAM1345 host target gene. KIAA1463 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1463, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1463 BINDING SITE, designated SEQ ID:35769, to the nucleotide sequence of VGAM1345 RNA, herein designated VGAM RNA, also designated SEQ ID:4056.

[47574] Another function of VGAM1345 is therefore inhibition of KIAA1463 (Accession XM_051160). Accordingly, utilities

of VGAM1345 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1463. KIAA1706 (Accession XM_166595) is another VGAM1345 host target gene. KIAA1706 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1706, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1706 BINDING SITE, designated SEQ ID:44575, to the nucleotide sequence of VGAM1345 RNA, herein designated VGAM RNA, also designated SEQ ID:4056.

[47575] Another function of VGAM1345 is therefore inhibition of KIAA1706 (Accession XM_166595). Accordingly, utilities of VGAM1345 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1706. LIM and SH3 Protein 1 (LASP1, Accession NM_006148) is another VGAM1345 host target gene. LASP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LASP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of LASP1 BINDING SITE, designated SEQ ID:12792, to the nucleotide sequence of VGAM1345 RNA, herein designated VGAM RNA, also designated SEQ ID:4056.

[47576] Another function of VGAM1345 is therefore inhibition of LIM and SH3 Protein 1 (LASP1, Accession NM_006148). Accordingly, utilities of VGAM1345 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LASP1. MGC16063 (Accession NM_053047) is another VGAM1345 host target gene. MGC16063 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC16063, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC16063 BINDING SITE, designated SEQ ID:27591, to the nucleotide sequence of VGAM1345 RNA, herein designated VGAM RNA, also designated SEQ ID:4056.

[47577] Another function of VGAM1345 is therefore inhibition of MGC16063 (Accession NM_053047). Accordingly, utilities of VGAM1345 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

MGC16063. MGC2474 (Accession NM_023931) is another VGAM1345 host target gene. MGC2474 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC2474, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2474 BINDING SITE, designated SEQ ID:23421, to the nucleotide sequence of VGAM1345 RNA, herein designated VGAM RNA, also designated SEQ ID:4056.

[47578] Another function of VGAM1345 is therefore inhibition of MGC2474 (Accession NM_023931). Accordingly, utilities of VGAM1345 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2474. Osteomodulin (OMD, Accession NM_005014) is another VGAM1345 host target gene. OMD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OMD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OMD BINDING SITE, designated SEQ ID:11456, to the nucleotide sequence of VGAM1345 RNA, herein designated VGAM RNA,

also designated SEQ ID:4056.

[47579] Another function of VGAM1345 is therefore inhibition of Osteomodulin (OMD, Accession NM_005014). Accordingly, utilities of VGAM1345 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OMD. P37NB (Accession NM_005824) is another VGAM1345 host target gene. P37NB BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by P37NB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P37NB BINDING SITE, designated SEQ ID:12435, to the nucleotide sequence of VGAM1345 RNA, herein designated VGAM RNA, also designated SEQ ID:4056.

[47580] Another function of VGAM1345 is therefore inhibition of P37NB (Accession NM_005824). Accordingly, utilities of VGAM1345 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P37NB. Period Homolog 3 (Drosophila) (PER3, Accession NM_016831) is another VGAM1345 host target gene. PER3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PER3, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PER3 BINDING SITE, designated SEQ ID:18822, to the nucleotide sequence of VGAM1345 RNA, herein designated VGAM RNA, also designated SEQ ID:4056.

[47581] Another function of VGAM1345 is therefore inhibition of Period Homolog 3 (Drosophila) (PER3, Accession NM_016831). Accordingly, utilities of VGAM1345 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PER3. T2BP (Accession XM_046111) is another VGAM1345 host target gene. T2BP BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by T2BP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of T2BP BINDING SITE, designated SEQ ID:34683, to the nucleotide sequence of VGAM1345 RNA, herein designated VGAM RNA, also designated SEQ ID:4056.

[47582] Another function of VGAM1345 is therefore inhibition of T2BP (Accession XM_046111). Accordingly, utilities of VGAM1345 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with T2BP. Transducer of ERBB2, 2 (TOB2, Accession XM_170995) is another VGAM1345 host target gene. TOB2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TOB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TOB2 BINDING SITE, designated SEQ ID:45766, to the nucleotide sequence of VGAM1345 RNA, herein designated VGAM RNA, also designated SEQ ID:4056.

[47583] Another function of VGAM1345 is therefore inhibition of Transducer of ERBB2, 2 (TOB2, Accession XM_170995). Accordingly, utilities of VGAM1345 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TOB2. LOC120939 (Accession XM_073688) is another VGAM1345 host target gene. LOC120939 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC120939, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC120939 BINDING SITE, desig-

nated SEQ ID:37516, to the nucleotide sequence of VGAM1345 RNA, herein designated VGAM RNA, also designated SEQ ID:4056.

[47584] Another function of VGAM1345 is therefore inhibition of LOC120939 (Accession XM_073688). Accordingly, utilities of VGAM1345 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC120939. LOC128989 (Accession XM_059310) is another VGAM1345 host target gene. LOC128989 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC128989, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC128989 BINDING SITE, designated SEQ ID:36941, to the nucleotide sequence of VGAM1345 RNA, herein designated VGAM RNA, also designated SEQ ID:4056.

[47585] Another function of VGAM1345 is therefore inhibition of LOC128989 (Accession XM_059310). Accordingly, utilities of VGAM1345 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC128989. LOC148085 (Accession XM_097388) is another VGAM1345 host target gene. LOC148085 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148085, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148085 BINDING SITE, designated SEQ ID:40868, to the nucleotide sequence of VGAM1345 RNA, herein designated VGAM RNA, also designated SEQ ID:4056.

[47586] Another function of VGAM1345 is therefore inhibition of LOC148085 (Accession XM_097388). Accordingly, utilities of VGAM1345 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148085. LOC220776 (Accession XM_043388) is another VGAM1345 host target gene. LOC220776 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220776, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220776 BINDING SITE, designated SEQ ID:33930, to the nucleotide sequence of VGAM1345 RNA, herein designated VGAM RNA, also designated SEQ ID:4056.

[47587] Another function of VGAM1345 is therefore inhibition of

LOC220776 (Accession XM_043388). Accordingly, utilities of VGAM1345 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220776. LOC221042 (Accession XM_167669) is another VGAM1345 host target gene. LOC221042 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221042, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221042 BINDING SITE, designated SEQ ID:44752, to the nucleotide sequence of VGAM1345 RNA, herein designated VGAM RNA, also designated SEQ ID:4056.

[47588] Another function of VGAM1345 is therefore inhibition of LOC221042 (Accession XM_167669). Accordingly, utilities of VGAM1345 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221042. LOC256905 (Accession XM_173031) is another VGAM1345 host target gene. LOC256905 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC256905, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC256905 BINDING SITE, designated SEQ ID:46296, to the nucleotide sequence of VGAM1345 RNA, herein designated VGAM RNA, also designated SEQ ID:4056.

[47589] Another function of VGAM1345 is therefore inhibition of LOC256905 (Accession XM_173031). Accordingly, utilities of VGAM1345 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256905. LOC93380 (Accession XM_051020) is another VGAM1345 host target gene. LOC93380 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC93380, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93380 BINDING SITE, designated SEQ ID:35728, to the nucleotide sequence of VGAM1345 RNA, herein designated VGAM RNA, also designated SEQ ID:4056.

[47590] Another function of VGAM1345 is therefore inhibition of LOC93380 (Accession XM_051020). Accordingly, utilities of VGAM1345 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93380. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1346 (VGAM1346) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47591] VGAM1346 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1346 was detected is described hereinabove with reference to Figs. 1–8.

[47592] VGAM1346 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus. VGAM1346 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47593] VGAM1346 gene encodes a VGAM1346 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1346 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1346 precursor RNA is designated SEQ ID:1332, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:1332 is located at position 256840 relative to the genome of Fowlpox Virus.

[47594] VGAM1346 precursor RNA folds onto itself, forming VGAM1346 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47595] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1346 folded precursor RNA into VGAM1346 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1346 RNA is designated SEQ ID:4057, and is provided hereinbelow with reference to the sequence listing part.

[47596] VGAM1346 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1346 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1346 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[47597] VGAM1346 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1346 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1346 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1346 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1346 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[47598] The complementary binding of VGAM1346 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1346 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1346 host target RNA into VGAM1346 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47599] It is appreciated that VGAM1346 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1346 host target genes. The mRNA of each one of this plurality of VGAM1346 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1346 RNA, herein designated VGAM RNA, and which when bound by VGAM1346 RNA causes inhibition of translation of respective one or more

VGAM1346 host target proteins.

[47600] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1346 gene, herein designated VGAM GENE, on one or more VGAM1346 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[47601] It is yet further appreciated that a function of VGAM1346 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1346 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific

functions, and accordingly utilities, of VGAM1346 correlate with, and may be deduced from, the identity of the host target genes which VGAM1346 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47602] Nucleotide sequences of the VGAM1346 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1346 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1346 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1346 are further described hereinbelow with reference to Table 1.

[47603] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1346 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1346 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47604] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1346 gene, herein designated VGAM is inhibition of expression of VGAM1346 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM1346 correlate with, and may be deduced from, the identity of the target genes which VGAM1346 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[47605] ATPase, Ca++ Transporting, Cardiac Muscle, Slow Twitch 2 (ATP2A2, Accession NM_001681) is a VGAM1346 host target gene. ATP2A2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP2A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP2A2 BINDING SITE, designated SEQ ID:7402, to the nucleotide sequence of VGAM1346 RNA, herein designated VGAM RNA, also designated SEQ ID:4057.

[47606] A function of VGAM1346 is therefore inhibition of ATPase, Ca++ Transporting, Cardiac Muscle, Slow Twitch 2 (ATP2A2, Accession NM_001681). Accordingly, utilities of VGAM1346 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP2A2. KIAA1674 (Accession XM_044065) is another VGAM1346 host target gene. KIAA1674 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA1674, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1674 BINDING SITE, designated SEQ ID:34102, to the nucleotide sequence of VGAM1346 RNA, herein designated VGAM RNA, also designated SEQ ID:4057.

[47607] Another function of VGAM1346 is therefore inhibition of KIAA1674 (Accession XM_044065). Accordingly, utilities of VGAM1346 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1674. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1347 (VGAM1347) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47608] VGAM1347 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1347 was detected is described hereinabove with reference to Figs. 1-8.

[47609] VGAM1347 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Fowlpox Virus.

VGAM1347 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47610] VGAM1347 gene encodes a VGAM1347 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1347 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1347 precursor RNA is designated SEQ ID:1333, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1333 is located at position 251073 relative to the genome of Fowlpox Virus.

[47611] VGAM1347 precursor RNA folds onto itself, forming VGAM1347 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47612] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1347 folded precursor RNA into VGAM1347 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1347 RNA is designated SEQ ID:4058, and is provided hereinbelow with reference to the sequence listing part.

[47613] VGAM1347 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1347 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1347 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[47614] VGAM1347 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1347 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1347 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1347 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1347 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[47615] The complementary binding of VGAM1347 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1347 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1347

host target RNA into VGAM1347 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47616] It is appreciated that VGAM1347 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1347 host target genes. The mRNA of each one of this plurality of VGAM1347 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1347 RNA, herein designated VGAM RNA, and which when bound by VGAM1347 RNA causes inhibition of translation of respective one or more VGAM1347 host target proteins.

[47617] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1347 gene, herein designated VGAM GENE, on one or more VGAM1347 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[47618] It is yet further appreciated that a function of VGAM1347 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1347 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM1347 correlate with, and may be deduced from, the identity of the host target genes which VGAM1347 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47619] Nucleotide sequences of the VGAM1347 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1347 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1347 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1347 are further

described hereinbelow with reference to Table 1.

[47620] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1347 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1347 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47621] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1347 gene, herein designated VGAM is inhibition of expression of VGAM1347 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1347 correlate with, and may be deduced from, the identity of the target genes which VGAM1347 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[47622] Iduronate 2-sulfatase (Hunter syndrome) (IDS, Accession NM_000202) is a VGAM1347 host target gene. IDS BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by IDS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IDS BIND-

ING SITE, designated SEQ ID:5698, to the nucleotide sequence of VGAM1347 RNA, herein designated VGAM RNA, also designated SEQ ID:4058.

[47623] A function of VGAM1347 is therefore inhibition of Iduronate 2-sulfatase (Hunter syndrome) (IDS, Accession NM_000202). Accordingly, utilities of VGAM1347 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IDS. LOC200269 (Accession XM_114175) is another VGAM1347 host target gene. LOC200269 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200269, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200269 BINDING SITE, designated SEQ ID:42759, to the nucleotide sequence of VGAM1347 RNA, herein designated VGAM RNA, also designated SEQ ID:4058.

[47624] Another function of VGAM1347 is therefore inhibition of LOC200269 (Accession XM_114175). Accordingly, utilities of VGAM1347 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200269. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1348 (VGAM1348) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47625] VGAM1348 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1348 was detected is described hereinabove with reference to Figs. 1–8.

[47626] VGAM1348 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus. VGAM1348 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47627] VGAM1348 gene encodes a VGAM1348 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1348 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1348 precursor RNA is designated SEQ ID:1334, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:1334 is located at position 254555 relative to the genome of Fowlpox Virus.

[47628] VGAM1348 precursor RNA folds onto itself, forming VGAM1348 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47629] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1348 folded precursor RNA into VGAM1348 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1348 RNA is designated SEQ ID:4059, and is provided hereinbelow with reference to the sequence listing part.

[47630] VGAM1348 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1348 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1348 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[47631] VGAM1348 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1348 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1348 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1348 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1348 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[47632] The complementary binding of VGAM1348 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1348 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1348 host target RNA into VGAM1348 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47633] It is appreciated that VGAM1348 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1348 host target genes. The mRNA of each one of this plurality of VGAM1348 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1348 RNA, herein designated VGAM RNA, and which when bound by VGAM1348 RNA causes inhibition of translation of respective one or more

VGAM1348 host target proteins.

[47634] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1348 gene, herein designated VGAM GENE, on one or more VGAM1348 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[47635] It is yet further appreciated that a function of VGAM1348 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1348 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific

functions, and accordingly utilities, of VGAM1348 correlate with, and may be deduced from, the identity of the host target genes which VGAM1348 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47636] Nucleotide sequences of the VGAM1348 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1348 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1348 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1348 are further described hereinbelow with reference to Table 1.

[47637] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1348 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1348 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47638] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1348 gene, herein designated VGAM is inhibition of expression of VGAM1348 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM1348 correlate with, and may be deduced from, the identity of the target genes which VGAM1348 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[47639] Interferon Regulatory Factor 1 (IRF1, Accession XM_034862) is a VGAM1348 host target gene. IRF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IRF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IRF1 BINDING SITE, designated SEQ ID:32174, to the nucleotide sequence of VGAM1348 RNA, herein designated VGAM RNA, also designated SEQ ID:4059.

[47640] A function of VGAM1348 is therefore inhibition of Interferon Regulatory Factor 1 (IRF1, Accession XM_034862), a gene which specifically binds to the upstream regulatory region of type I IFN and IFN-inducible MHC class I genes. Accordingly, utilities of VGAM1348 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IRF1. The function of IRF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described

hereinabove with reference to VGAM1264. Membrane Protein, Palmitoylated 2 (MAGUK p55 subfamily member 2) (MPP2, Accession XM_008355) is another VGAM1348 host target gene. MPP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MPP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MPP2 BINDING SITE, designated SEQ ID:30079, to the nucleotide sequence of VGAM1348 RNA, herein designated VGAM RNA, also designated SEQ ID:4059.

[47641] Another function of VGAM1348 is therefore inhibition of Membrane Protein, Palmitoylated 2 (MAGUK p55 subfamily member 2) (MPP2, Accession XM_008355). Accordingly, utilities of VGAM1348 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MPP2. Rhesus Blood Group, D Antigen (RHD, Accession NM_016225) is another VGAM1348 host target gene. RHD BINDING SITE1 and RHD BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by RHD, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RHD BINDING SITE1 and RHD BINDING SITE2, designated SEQ ID:18335 and SEQ ID:18215 respectively, to the nucleotide sequence of VGAM1348 RNA, herein designated VGAM RNA, also designated SEQ ID:4059.

[47642] Another function of VGAM1348 is therefore inhibition of Rhesus Blood Group, D Antigen (RHD, Accession NM_016225), a gene which Major antigen of the RH system. Accordingly, utilities of VGAM1348 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RHD. The function of RHD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74.FLJ10620 (Accession NM_018157) is another VGAM1348 host target gene. FLJ10620 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10620, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10620 BINDING SITE, designated SEQ ID:19971, to the nucleotide sequence of VGAM1348

RNA, herein designated VGAM RNA, also designated SEQ ID:4059.

[47643] Another function of VGAM1348 is therefore inhibition of FLJ10620 (Accession NM_018157). Accordingly, utilities of VGAM1348 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10620. FLJ11753 (Accession NM_024659) is another VGAM1348 host target gene. FLJ11753 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11753, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11753 BINDING SITE, designated SEQ ID:23962, to the nucleotide sequence of VGAM1348 RNA, herein designated VGAM RNA, also designated SEQ ID:4059.

[47644] Another function of VGAM1348 is therefore inhibition of FLJ11753 (Accession NM_024659). Accordingly, utilities of VGAM1348 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11753. KIAA1100 (Accession NM_014901) is another VGAM1348 host target gene. KIAA1100 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA1100, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1100 BINDING SITE, designated SEQ ID:17086, to the nucleotide sequence of VGAM1348 RNA, herein designated VGAM RNA, also designated SEQ ID:4059.

[47645] Another function of VGAM1348 is therefore inhibition of KIAA1100 (Accession NM_014901). Accordingly, utilities of VGAM1348 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1100. KIAA1199 (Accession XM_051860) is another VGAM1348 host target gene. KIAA1199 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1199, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1199 BINDING SITE, designated SEQ ID:35897, to the nucleotide sequence of VGAM1348 RNA, herein designated VGAM RNA, also designated SEQ ID:4059.

[47646] Another function of VGAM1348 is therefore inhibition of KIAA1199 (Accession XM_051860). Accordingly, utilities

of VGAM1348 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1199. NCX (Accession NM_016170) is another VGAM1348 host target gene. NCX BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by NCX, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NCX BINDING SITE, designated SEQ ID:18261, to the nucleotide sequence of VGAM1348 RNA, herein designated VGAM RNA, also designated SEQ ID:4059.

[47647] Another function of VGAM1348 is therefore inhibition of NCX (Accession NM_016170). Accordingly, utilities of VGAM1348 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCX. Oligodendrocyte Transcription Factor 1 (OLIG1, Accession XM_170977) is another VGAM1348 host target gene. OLIG1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by OLIG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of OLIG1 BINDING SITE, designated SEQ ID:45752, to the nucleotide sequence of VGAM1348 RNA, herein designated VGAM RNA, also designated SEQ ID:4059.

[47648] Another function of VGAM1348 is therefore inhibition of Oligodendrocyte Transcription Factor 1 (OLIG1, Accession XM_170977). Accordingly, utilities of VGAM1348 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OLIG1. PP3501 (Accession NM_021731) is another VGAM1348 host target gene. PP3501 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PP3501, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PP3501 BINDING SITE, designated SEQ ID:22329, to the nucleotide sequence of VGAM1348 RNA, herein designated VGAM RNA, also designated SEQ ID:4059.

[47649] Another function of VGAM1348 is therefore inhibition of PP3501 (Accession NM_021731). Accordingly, utilities of VGAM1348 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

PP3501. STIP-1 (Accession XM_045694) is another VGAM1348 host target gene. STIP-1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STIP-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STIP-1 BINDING SITE, designated SEQ ID:34527, to the nucleotide sequence of VGAM1348 RNA, herein designated VGAM RNA, also designated SEQ ID:4059.

[47650] Another function of VGAM1348 is therefore inhibition of STIP-1 (Accession XM_045694). Accordingly, utilities of VGAM1348 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STIP-1. YKT6 (Accession NM_006555) is another VGAM1348 host target gene. YKT6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by YKT6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of YKT6 BINDING SITE, designated SEQ ID:13318, to the nucleotide sequence of VGAM1348 RNA, herein designated VGAM RNA, also designated SEQ

ID:4059.

[47651] Another function of VGAM1348 is therefore inhibition of YKT6 (Accession NM_006555). Accordingly, utilities of VGAM1348 include diagnosis, prevention and treatment of diseases and clinical conditions associated with YKT6. LOC145216 (Accession XM_096730) is another VGAM1348 host target gene. LOC145216 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145216, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145216 BINDING SITE, designated SEQ ID:40507, to the nucleotide sequence of VGAM1348 RNA, herein designated VGAM RNA, also designated SEQ ID:4059.

[47652] Another function of VGAM1348 is therefore inhibition of LOC145216 (Accession XM_096730). Accordingly, utilities of VGAM1348 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145216. LOC146513 (Accession XM_097013) is another VGAM1348 host target gene. LOC146513 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146513, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146513 BINDING SITE, designated SEQ ID:40708, to the nucleotide sequence of VGAM1348 RNA, herein designated VGAM RNA, also designated SEQ ID:4059.

[47653] Another function of VGAM1348 is therefore inhibition of LOC146513 (Accession XM_097013). Accordingly, utilities of VGAM1348 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146513. LOC147081 (Accession XM_085696) is another VGAM1348 host target gene. LOC147081 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147081, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147081 BINDING SITE, designated SEQ ID:38288, to the nucleotide sequence of VGAM1348 RNA, herein designated VGAM RNA, also designated SEQ ID:4059.

[47654] Another function of VGAM1348 is therefore inhibition of LOC147081 (Accession XM_085696). Accordingly, utilities of VGAM1348 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC147081. LOC257464 (Accession XM_116972) is another VGAM1348 host target gene. LOC257464 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC257464, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257464 BINDING SITE, designated SEQ ID:43162, to the nucleotide sequence of VGAM1348 RNA, herein designated VGAM RNA, also designated SEQ ID:4059.

[47655] Another function of VGAM1348 is therefore inhibition of LOC257464 (Accession XM_116972). Accordingly, utilities of VGAM1348 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257464. LOC51194 (Accession NM_016338) is another VGAM1348 host target gene. LOC51194 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC51194, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51194 BINDING SITE, designated SEQ ID:18459, to the

nucleotide sequence of VGAM1348 RNA, herein designated VGAM RNA, also designated SEQ ID:4059.

[47656] Another function of VGAM1348 is therefore inhibition of LOC51194 (Accession NM_016338). Accordingly, utilities of VGAM1348 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51194. LOC90190 (Accession XM_029758) is another VGAM1348 host target gene. LOC90190 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90190, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90190 BINDING SITE, designated SEQ ID:30948, to the nucleotide sequence of VGAM1348 RNA, herein designated VGAM RNA, also designated SEQ ID:4059.

[47657] Another function of VGAM1348 is therefore inhibition of LOC90190 (Accession XM_029758). Accordingly, utilities of VGAM1348 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90190. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 1349 (VGAM1349) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47658] VGAM1349 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1349 was detected is described hereinabove with reference to Figs. 1–8.

[47659] VGAM1349 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus. VGAM1349 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47660] VGAM1349 gene encodes a VGAM1349 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1349 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1349 precursor RNA is designated SEQ ID:1335, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1335 is located at position 252237 relative to the genome of Fowlpox Virus.

[47661] VGAM1349 precursor RNA folds onto itself, forming VGAM1349 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47662] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1349 folded precursor RNA into VGAM1349 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1349 RNA is designated SEQ ID:4060, and is provided hereinbelow with reference to the sequence listing part.

[47663] VGAM1349 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1349 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1349 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[47664] VGAM1349 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1349 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1349 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1349 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1349 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[47665] The complementary binding of VGAM1349 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1349 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1349 host target RNA into VGAM1349 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47666] It is appreciated that VGAM1349 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1349 host target genes. The mRNA of each one of this plurality of VGAM1349 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1349 RNA, herein designated VGAM RNA, and which when bound by VGAM1349 RNA causes inhibition of translation of respective one or more VGAM1349 host target proteins.

[47667] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1349 gene, herein designated VGAM GENE, on one or more VGAM1349 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[47668] It is yet further appreciated that a function of VGAM1349 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1349 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM1349 correlate with, and may be deduced from, the identity of the

host target genes which VGAM1349 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47669] Nucleotide sequences of the VGAM1349 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1349 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1349 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1349 are further described hereinbelow with reference to Table 1.

[47670] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1349 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1349 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47671] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1349 gene, herein designated VGAM is inhibition of expression of VGAM1349 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1349 correlate with, and may be deduced from, the identity of the target genes which VGAM1349

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[47672] DKFZP586D0623 (Accession XM_050418) is a VGAM1349 host target gene. DKFZP586D0623 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZP586D0623, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP586D0623 BINDING SITE, designated SEQ ID:35626, to the nucleotide sequence of VGAM1349 RNA, herein designated VGAM RNA, also designated SEQ ID:4060.

[47673] A function of VGAM1349 is therefore inhibition of DKFZP586D0623 (Accession XM_050418). Accordingly, utilities of VGAM1349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586D0623. Mitogen-activated Protein Kinase-activated Protein Kinase 3 (MAPKAPK3, Accession NM_004635) is another VGAM1349 host target gene. MAPKAPK3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MAPKAPK3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of MAPKAPK3 BINDING SITE, designated SEQ ID:11010, to the nucleotide sequence of VGAM1349 RNA, herein designated VGAM RNA, also designated SEQ ID:4060.

[47674] Another function of VGAM1349 is therefore inhibition of Mitogen-activated Protein Kinase-activated Protein Kinase 3 (MAPKAPK3, Accession NM_004635). Accordingly, utilities of VGAM1349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPKAPK3. MGC10955 (Accession NM_032676) is another VGAM1349 host target gene. MGC10955 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC10955, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC10955 BINDING SITE, designated SEQ ID:26398, to the nucleotide sequence of VGAM1349 RNA, herein designated VGAM RNA, also designated SEQ ID:4060.

[47675] Another function of VGAM1349 is therefore inhibition of MGC10955 (Accession NM_032676). Accordingly, utilities of VGAM1349 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with MGC10955. Mitochondrial Ribosomal Protein L10 (MRPL10, Accession NM_145255) is another VGAM1349 host target gene. MRPL10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MRPL10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MRPL10 BINDING SITE, designated SEQ ID:29768, to the nucleotide sequence of VGAM1349 RNA, herein designated VGAM RNA, also designated SEQ ID:4060.

[47676] Another function of VGAM1349 is therefore inhibition of Mitochondrial Ribosomal Protein L10 (MRPL10, Accession NM_145255). Accordingly, utilities of VGAM1349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPL10. LOC149578 (Accession XM_086592) is another VGAM1349 host target gene. LOC149578 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149578, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of LOC149578 BINDING SITE, designated SEQ ID:38780, to the nucleotide sequence of VGAM1349 RNA, herein designated VGAM RNA, also designated SEQ ID:4060.

[47677] Another function of VGAM1349 is therefore inhibition of LOC149578 (Accession XM_086592). Accordingly, utilities of VGAM1349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149578. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1350 (VGAM1350) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47678] VGAM1350 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1350 was detected is described hereinabove with reference to Figs. 1–8.

[47679] VGAM1350 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus. VGAM1350 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[47680] VGAM1350 gene encodes a VGAM1350 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1350 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1350 precursor RNA is designated SEQ ID:1336, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1336 is located at position 254693 relative to the genome of Fowlpox Virus.

[47681] VGAM1350 precursor RNA folds onto itself, forming VGAM1350 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47682] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1350 folded precursor RNA into VGAM1350 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide sequence of VGAM1350 RNA is designated SEQ ID:4061, and is provided hereinbelow with reference to the sequence listing part.

[47683] VGAM1350 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1350 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1350 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[47684] VGAM1350 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1350 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1350 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1350 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1350 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[47685] The complementary binding of VGAM1350 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1350 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1350 host target RNA into VGAM1350 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47686] It is appreciated that VGAM1350 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1350 host target genes. The mRNA of each one of this plurality of VGAM1350 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1350 RNA, herein designated VGAM RNA, and which when bound by VGAM1350 RNA causes inhibition of translation of respective one or more VGAM1350 host target proteins.

[47687] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1350 gene, herein designated VGAM GENE, on one or more VGAM1350 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[47688] It is yet further appreciated that a function of VGAM1350 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1350 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM1350 correlate with, and may be deduced from, the identity of the host target genes which VGAM1350 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47689] Nucleotide sequences of the VGAM1350 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1350 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1350 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1350 are further described hereinbelow with reference to Table 1.

[47690] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM1350 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1350 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47691] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1350 gene, herein designated VGAM is inhibition of expression of VGAM1350 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1350 correlate with, and may be deduced from, the identity of the target genes which VGAM1350 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[47692] Chloride Channel 3 (CLCN3, Accession NM_001829) is a VGAM1350 host target gene. CLCN3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLCN3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLCN3 BINDING SITE, designated SEQ ID:7568, to the nucleotide sequence of VGAM1350 RNA, herein designated VGAM RNA, also designated SEQ ID:4061.

[47693] A function of VGAM1350 is therefore inhibition of Chloride Channel 3 (CLCN3, Accession NM_001829), a gene which play a role in the neural cell function through regulation of membrane excitability. Accordingly, utilities of VGAM1350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLCN3. The function of CLCN3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1332. Tripartite Motif-containing 14 (TRIM14, Accession NM_014788) is another VGAM1350 host target gene. TRIM14 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRIM14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIM14 BINDING SITE, designated SEQ ID:16664, to the nucleotide sequence of VGAM1350 RNA, herein designated VGAM RNA, also designated SEQ ID:4061.

[47694] Another function of VGAM1350 is therefore inhibition of Tripartite Motif-containing 14 (TRIM14, Accession NM_014788), a gene which is composed of 3 zinc-binding

domains and is involved in development and cell growth. Accordingly, utilities of VGAM1350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM14. The function of TRIM14 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM180. Trichorhinophalangeal Syndrome I (TRPS1, Accession NM_014112) is another VGAM1350 host target gene. TRPS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRPS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPS1 BINDING SITE, designated SEQ ID:15346, to the nucleotide sequence of VGAM1350 RNA, herein designated VGAM RNA, also designated SEQ ID:4061.

[47695] Another function of VGAM1350 is therefore inhibition of Trichorhinophalangeal Syndrome I (TRPS1, Accession NM_014112), a gene which may function as a transcriptional activator protein. Accordingly, utilities of VGAM1350 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with TRPS1. The function of TRPS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM172. KIAA1431 (Accession XM_032055) is another VGAM1350 host target gene. KIAA1431 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1431, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1431 BINDING SITE, designated SEQ ID:31549, to the nucleotide sequence of VGAM1350 RNA, herein designated VGAM RNA, also designated SEQ ID:4061.

[47696] Another function of VGAM1350 is therefore inhibition of KIAA1431 (Accession XM_032055). Accordingly, utilities of VGAM1350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1431. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1351 (VGAM1351) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[47697] VGAM1351 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1351 was detected is described hereinabove with reference to Figs. 1-8.

[47698] VGAM1351 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus. VGAM1351 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47699] VGAM1351 gene encodes a VGAM1351 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1351 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1351 precursor RNA is designated SEQ ID:1337, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1337 is located at position 252589 relative to the genome of Fowlpox Virus.

[47700] VGAM1351 precursor RNA folds onto itself, forming VGAM1351 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47701] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1351 folded precursor RNA into VGAM1351 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 54%) nucleotide sequence of VGAM1351 RNA is designated SEQ ID:4062, and is provided hereinbelow with reference to the sequence listing part.

[47702] VGAM1351 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1351 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1351 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[47703] VGAM1351 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1351 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1351 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1351 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1351 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[47704] The complementary binding of VGAM1351 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1351 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1351 host target RNA into VGAM1351 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47705] It is appreciated that VGAM1351 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1351 host target genes. The mRNA of each one of this plurality of VGAM1351 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1351 RNA, herein designated VGAM RNA, and which when bound by VGAM1351 RNA causes inhibition of translation of respective one or more VGAM1351 host target proteins.

[47706] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1351 gene, herein designated VGAM GENE, on one or more VGAM1351 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[47707] It is yet further appreciated that a function of VGAM1351 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1351 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM1351 correlate with, and may be deduced from, the identity of the host target genes which VGAM1351 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[47708] Nucleotide sequences of the VGAM1351 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1351 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1351 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1351 are further described hereinbelow with reference to Table 1.

[47709] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1351 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1351 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47710] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1351 gene, herein designated VGAM is inhibition of expression of VGAM1351 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1351 correlate with, and may be deduced from, the identity of the target genes which VGAM1351 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[47711] ARPP-19 (Accession NM_006628) is a VGAM1351 host target gene. ARPP-19 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ARPP-19, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARPP-19 BINDING SITE, designated SEQ ID:13421, to the nucleotide sequence of VGAM1351 RNA, herein designated VGAM RNA, also designated SEQ ID:4062.

[47712] A function of VGAM1351 is therefore inhibition of ARPP-19 (Accession NM_006628). Accordingly, utilities of VGAM1351 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARPP-19. LOC113523 (Accession XM_054378) is another VGAM1351 host target gene. LOC113523 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC113523, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC113523 BINDING SITE, designated SEQ ID:36149, to the nucleotide sequence of VGAM1351 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4062.

[47713] Another function of VGAM1351 is therefore inhibition of LOC113523 (Accession XM_054378). Accordingly, utilities of VGAM1351 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC113523. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1352 (VGAM1352) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47714] VGAM1352 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1352 was detected is described hereinabove with reference to Figs. 1–8.

[47715] VGAM1352 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus. VGAM1352 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47716] VGAM1352 gene encodes a VGAM1352 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM1352 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1352 precursor RNA is designated SEQ ID:1338, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1338 is located at position 252917 relative to the genome of Fowlpox Virus.

- [47717] VGAM1352 precursor RNA folds onto itself, forming VGAM1352 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [47718] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1352 folded precursor RNA into VGAM1352 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1352 RNA is designated SEQ ID:4063, and is provided hereinbelow with reference to the sequence listing part.

[47719] VGAM1352 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1352 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1352 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[47720] VGAM1352 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1352 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1352 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1352 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1352 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[47721] The complementary binding of VGAM1352 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1352 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1352 host target RNA into VGAM1352 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47722] It is appreciated that VGAM1352 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1352 host target genes. The mRNA of

each one of this plurality of VGAM1352 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1352 RNA, herein designated VGAM RNA, and which when bound by VGAM1352 RNA causes inhibition of translation of respective one or more VGAM1352 host target proteins.

[47723] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1352 gene, herein designated VGAM GENE, on one or more VGAM1352 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[47724] It is yet further appreciated that a function of VGAM1352 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1352 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM1352 correlate with, and may be deduced from, the identity of the host target genes which VGAM1352 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47725] Nucleotide sequences of the VGAM1352 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1352 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1352 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1352 are further described hereinbelow with reference to Table 1.

[47726] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1352 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1352 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47727] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1352 gene, herein designated VGAM is inhibition of expression of VGAM1352 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1352 correlate with, and may be deduced from, the identity of the target genes which VGAM1352 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[47728] Homeo Box A7 (HOXA7, Accession NM_006896) is a VGAM1352 host target gene. HOXA7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HOXA7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HOXA7 BINDING SITE, designated SEQ ID:13768, to the nucleotide sequence of VGAM1352 RNA, herein designated VGAM RNA, also designated SEQ ID:4063.

[47729] A function of VGAM1352 is therefore inhibition of Homeo Box A7 (HOXA7, Accession NM_006896), a gene which provides cells with specific positional identities on the an-

terior-posterior axis. Accordingly, utilities of VGAM1352 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HOXA7. The function of HOXA7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM206. Sodium Channel, Voltage-gated, Type I, Alpha Polypeptide (SCN1A, Accession XM_114281) is another VGAM1352 host target gene. SCN1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCN1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCN1A BINDING SITE, designated SEQ ID:42838, to the nucleotide sequence of VGAM1352 RNA, herein designated VGAM RNA, also designated SEQ ID:4063.

[47730] Another function of VGAM1352 is therefore inhibition of Sodium Channel, Voltage-gated, Type I, Alpha Polypeptide (SCN1A, Accession XM_114281). Accordingly, utilities of VGAM1352 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCN1A. DKFZp761N1114 (Accession XM_086327) is another

VGAM1352 host target gene. DKFZp761N1114 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZp761N1114, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761N1114 BINDING SITE, designated SEQ ID:38603, to the nucleotide sequence of VGAM1352 RNA, herein designated VGAM RNA, also designated SEQ ID:4063.

[47731] Another function of VGAM1352 is therefore inhibition of DKFZp761N1114 (Accession XM_086327). Accordingly, utilities of VGAM1352 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761N1114. FLJ11040 (Accession NM_018307) is another VGAM1352 host target gene. FLJ11040 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11040, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11040 BINDING SITE, designated SEQ ID:20297, to the nucleotide sequence of VGAM1352 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4063.

[47732] Another function of VGAM1352 is therefore inhibition of FLJ11040 (Accession NM_018307). Accordingly, utilities of VGAM1352 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11040. LOC199678 (Accession XM_117111) is another VGAM1352 host target gene. LOC199678 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC199678, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199678 BINDING SITE, designated SEQ ID:43226, to the nucleotide sequence of VGAM1352 RNA, herein designated VGAM RNA, also designated SEQ ID:4063.

[47733] Another function of VGAM1352 is therefore inhibition of LOC199678 (Accession XM_117111). Accordingly, utilities of VGAM1352 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199678. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1353 (VGAM1353) viral gene, which

modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47734] VGAM1353 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1353 was detected is described hereinabove with reference to Figs. 1–8.

[47735] VGAM1353 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus. VGAM1353 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47736] VGAM1353 gene encodes a VGAM1353 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1353 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1353 precursor RNA is designated SEQ ID:1339, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1339 is located at position 251158 relative to the genome of Fowlpox Virus.

[47737] VGAM1353 precursor RNA folds onto itself, forming

VGAM1353 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47738] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1353 folded precursor RNA into VGAM1353 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 56%) nucleotide sequence of VGAM1353 RNA is designated SEQ ID:4064, and is provided hereinbelow with reference to the sequence listing part.

[47739] VGAM1353 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1353 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1353 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[47740] VGAM1353 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1353 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1353 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1353 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1353 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[47741] The complementary binding of VGAM1353 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1353 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1353 host target RNA into VGAM1353 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47742] It is appreciated that VGAM1353 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1353 host target genes. The mRNA of each one of this plurality of VGAM1353 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1353 RNA, herein designated VGAM RNA, and which when bound by VGAM1353 RNA causes inhibition of translation of respective one or more VGAM1353 host target proteins.

[47743] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1353 gene, herein designated VGAM GENE, on one or more VGAM1353 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[47744] It is yet further appreciated that a function of VGAM1353 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1353 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM1353 correlate with, and may be deduced from, the identity of the host target genes which VGAM1353 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[47745] Nucleotide sequences of the VGAM1353 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1353 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1353 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1353 are further described hereinbelow with reference to Table 1.

[47746] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1353 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1353 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47747] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1353 gene, herein designated VGAM is inhibition of expression of VGAM1353 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1353 correlate with, and may be deduced from, the identity of the target genes which VGAM1353 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[47748] Egl Nine Homolog 2 (*C. elegans*) (EGLN2, Accession NM_017555) is a VGAM1353 host target gene. EGLN2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by EGLN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGLN2 BINDING SITE, designated SEQ ID:18993, to the nucleotide sequence of VGAM1353 RNA, herein designated VGAM RNA, also designated SEQ ID:4064.

[47749] A function of VGAM1353 is therefore inhibition of Egl Nine Homolog 2 (*C. elegans*) (EGLN2, Accession NM_017555), a gene which is an essential component of the pathway. Accordingly, utilities of VGAM1353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGLN2. The function of EGLN2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM432. BCL2-associated Athanogene 4 (BAG4, Accession NM_004874) is another VGAM1353 host target gene. BAG4 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region

of mRNA encoded by BAG4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BAG4 BINDING SITE, designated SEQ ID:11310, to the nucleotide sequence of VGAM1353 RNA, herein designated VGAM RNA, also designated SEQ ID:4064.

[47750] Another function of VGAM1353 is therefore inhibition of BCL2-associated Athanogene 4 (BAG4, Accession NM_004874). Accordingly, utilities of VGAM1353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BAG4. DKFZp761H079 (Accession NM_144996) is another VGAM1353 host target gene. DKFZp761H079 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp761H079, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761H079 BINDING SITE, designated SEQ ID:29600, to the nucleotide sequence of VGAM1353 RNA, herein designated VGAM RNA, also designated SEQ ID:4064.

[47751] Another function of VGAM1353 is therefore inhibition of

DKFZp761H079 (Accession NM_144996). Accordingly, utilities of VGAM1353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761H079. KIAA0232 (Accession XM_052627) is another VGAM1353 host target gene. KIAA0232 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0232, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0232 BINDING SITE, designated SEQ ID:36040, to the nucleotide sequence of VGAM1353 RNA, herein designated VGAM RNA, also designated SEQ ID:4064.

[47752] Another function of VGAM1353 is therefore inhibition of KIAA0232 (Accession XM_052627). Accordingly, utilities of VGAM1353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0232. KIAA1116 (Accession NM_014892) is another VGAM1353 host target gene. KIAA1116 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1116, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1116 BINDING SITE, designated SEQ ID:17042, to the nucleotide sequence of VGAM1353 RNA, herein designated VGAM RNA, also designated SEQ ID:4064.

[47753] Another function of VGAM1353 is therefore inhibition of KIAA1116 (Accession NM_014892). Accordingly, utilities of VGAM1353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1116. KIAA1557 (Accession XM_028289) is another VGAM1353 host target gene. KIAA1557 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1557, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1557 BINDING SITE, designated SEQ ID:30642, to the nucleotide sequence of VGAM1353 RNA, herein designated VGAM RNA, also designated SEQ ID:4064.

[47754] Another function of VGAM1353 is therefore inhibition of KIAA1557 (Accession XM_028289). Accordingly, utilities of VGAM1353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1557. LOC158549 (Accession XM_098963) is another

VGAM1353 host target gene. LOC158549 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158549, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158549 BINDING SITE, designated SEQ ID:42013, to the nucleotide sequence of VGAM1353 RNA, herein designated VGAM RNA, also designated SEQ ID:4064.

[47755] Another function of VGAM1353 is therefore inhibition of LOC158549 (Accession XM_098963). Accordingly, utilities of VGAM1353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158549. LOC51212 (Accession NM_016380) is another VGAM1353 host target gene. LOC51212 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC51212, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51212 BINDING SITE, designated SEQ ID:18519, to the nucleotide sequence of VGAM1353 RNA, herein designated VGAM RNA, also designated SEQ ID:4064.

[47756] Another function of VGAM1353 is therefore inhibition of LOC51212 (Accession NM_016380). Accordingly, utilities of VGAM1353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51212. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1354 (VGAM1354) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47757] VGAM1354 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1354 was detected is described hereinabove with reference to Figs. 1–8.

[47758] VGAM1354 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Triatoma Virus. VGAM1354 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47759] VGAM1354 gene encodes a VGAM1354 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM1354 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1354 precursor RNA is designated SEQ ID:1340, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1340 is located at position 7412 relative to the genome of Triatoma Virus.

- [47760] VGAM1354 precursor RNA folds onto itself, forming VGAM1354 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [47761] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1354 folded precursor RNA into VGAM1354 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 83%) nucleotide sequence of VGAM1354 RNA is designated SEQ ID:4065, and is provided hereinbelow with reference to the sequence listing part.

[47762] VGAM1354 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1354 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1354 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[47763] VGAM1354 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1354 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1354 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1354 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1354 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[47764] The complementary binding of VGAM1354 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1354 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1354 host target RNA into VGAM1354 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47765] It is appreciated that VGAM1354 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1354 host target genes. The mRNA of each one of this plurality of VGAM1354 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1354 RNA, herein designated VGAM RNA, and which when bound by VGAM1354 RNA causes inhibition of translation of respective one or more VGAM1354 host target proteins.

[47766] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1354 gene, herein designated VGAM GENE, on one or more VGAM1354 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[47767] It is yet further appreciated that a function of VGAM1354 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1354 include diagnosis, prevention and treatment of viral infection by Triatoma Virus. Specific functions, and accordingly utilities, of VGAM1354 correlate with, and may be deduced from, the identity of the host target genes which VGAM1354 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47768] Nucleotide sequences of the VGAM1354 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1354 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1354 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1354 are further described hereinbelow with reference to Table 1.

[47769] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1354 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1354 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[47770] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1354 gene, herein designated VGAM is inhibition of expression of VGAM1354 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1354 correlate with, and may be deduced from, the identity of the target genes which VGAM1354 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[47771] Glycoprotein A Repetitions Predominant (GARP, Accession NM_005512) is a VGAM1354 host target gene. GARP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GARP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GARP BINDING SITE, designated SEQ ID:12034, to the nucleotide sequence of VGAM1354 RNA, herein designated VGAM RNA, also designated SEQ ID:4065.

[47772] A function of VGAM1354 is therefore inhibition of Glycoprotein A Repetitions Predominant (GARP, Accession NM_005512). Accordingly, utilities of VGAM1354 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with GARP. Growth Differentiation Factor 8 (GDF8, Accession NM_005259) is another VGAM1354 host target gene. GDF8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GDF8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GDF8 BINDING SITE, designated SEQ ID:11765, to the nucleotide sequence of VGAM1354 RNA, herein designated VGAM RNA, also designated SEQ ID:4065.

[47773] Another function of VGAM1354 is therefore inhibition of Growth Differentiation Factor 8 (GDF8, Accession NM_005259), a gene which acts specifically as a negative regulator of skeletal muscle growth. Accordingly, utilities of VGAM1354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GDF8. The function of GDF8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM386.LIM Domain Containing Preferred Translocation Partner In Lipoma (LPP, Accession NM_005578) is another VGAM1354 host target gene. LPP

BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LPP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LPP BINDING SITE, designated SEQ ID:12104, to the nucleotide sequence of VGAM1354 RNA, herein designated VGAM RNA, also designated SEQ ID:4065.

[47774] Another function of VGAM1354 is therefore inhibition of LIM Domain Containing Preferred Translocation Partner In Lipoma (LPP, Accession NM_005578). Accordingly, utilities of VGAM1354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LPP. RAP1A, Member of RAS Oncogene Family (RAP1A, Accession NM_002884) is another VGAM1354 host target gene. RAP1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAP1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAP1A BINDING SITE, designated SEQ ID:8793, to the nucleotide sequence of VGAM1354 RNA, herein designated VGAM RNA, also designated SEQ

ID:4065.

[47775] Another function of VGAM1354 is therefore inhibition of RAP1A, Member of RAS Oncogene Family (RAP1A, Accession NM_002884), a gene which induces morphological reversion of a cell line transformed by a ras oncogene. Accordingly, utilities of VGAM1354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAP1A. The function of RAP1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM993.FLJ10052 (Accession NM_017982) is another VGAM1354 host target gene. FLJ10052 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10052, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10052 BINDING SITE, designated SEQ ID:19713, to the nucleotide sequence of VGAM1354 RNA, herein designated VGAM RNA, also designated SEQ ID:4065.

[47776] Another function of VGAM1354 is therefore inhibition of FLJ10052 (Accession NM_017982). Accordingly, utilities of

VGAM1354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10052. FLJ11730 (Accession NM_022756) is another VGAM1354 host target gene. FLJ11730 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11730, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11730 BINDING SITE, designated SEQ ID:22994, to the nucleotide sequence of VGAM1354 RNA, herein designated VGAM RNA, also designated SEQ ID:4065.

[47777] Another function of VGAM1354 is therefore inhibition of FLJ11730 (Accession NM_022756). Accordingly, utilities of VGAM1354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11730. FLJ21939 (Accession NM_022461) is another VGAM1354 host target gene. FLJ21939 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21939, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21939

BINDING SITE, designated SEQ ID:22803, to the nucleotide sequence of VGAM1354 RNA, herein designated VGAM RNA, also designated SEQ ID:4065.

[47778] Another function of VGAM1354 is therefore inhibition of FLJ21939 (Accession NM_022461). Accordingly, utilities of VGAM1354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21939. FLJ23537 (Accession NM_024889) is another VGAM1354 host target gene. FLJ23537 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23537, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23537 BINDING SITE, designated SEQ ID:24363, to the nucleotide sequence of VGAM1354 RNA, herein designated VGAM RNA, also designated SEQ ID:4065.

[47779] Another function of VGAM1354 is therefore inhibition of FLJ23537 (Accession NM_024889). Accordingly, utilities of VGAM1354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23537. KIAA0367 (Accession XM_041018) is another VGAM1354 host target gene. KIAA0367 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0367, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0367 BINDING SITE, designated SEQ ID:33421, to the nucleotide sequence of VGAM1354 RNA, herein designated VGAM RNA, also designated SEQ ID:4065.

[47780] Another function of VGAM1354 is therefore inhibition of KIAA0367 (Accession XM_041018). Accordingly, utilities of VGAM1354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0367. KIAA0555 (Accession NM_014790) is another VGAM1354 host target gene. KIAA0555 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0555, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0555 BINDING SITE, designated SEQ ID:16685, to the nucleotide sequence of VGAM1354 RNA, herein designated VGAM RNA, also designated SEQ ID:4065.

[47781] Another function of VGAM1354 is therefore inhibition of

KIAA0555 (Accession NM_014790). Accordingly, utilities of VGAM1354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0555. KIAA0594 (Accession XM_036117) is another VGAM1354 host target gene. KIAA0594 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0594, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0594 BINDING SITE, designated SEQ ID:32388, to the nucleotide sequence of VGAM1354 RNA, herein designated VGAM RNA, also designated SEQ ID:4065.

[47782] Another function of VGAM1354 is therefore inhibition of KIAA0594 (Accession XM_036117). Accordingly, utilities of VGAM1354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0594. KIAA1691 (Accession XM_166523) is another VGAM1354 host target gene. KIAA1691 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1691, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1691 BINDING SITE, designated SEQ ID:44461, to the nucleotide sequence of VGAM1354 RNA, herein designated VGAM RNA, also designated SEQ ID:4065.

[47783] Another function of VGAM1354 is therefore inhibition of KIAA1691 (Accession XM_166523). Accordingly, utilities of VGAM1354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1691. MGC13159 (Accession NM_032927) is another VGAM1354 host target gene. MGC13159 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC13159, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC13159 BINDING SITE, designated SEQ ID:26750, to the nucleotide sequence of VGAM1354 RNA, herein designated VGAM RNA, also designated SEQ ID:4065.

[47784] Another function of VGAM1354 is therefore inhibition of MGC13159 (Accession NM_032927). Accordingly, utilities of VGAM1354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13159. SCDGF-B (Accession NM_033135) is another

VGAM1354 host target gene. SCDGF-B BINDING SITE1 and SCDGF-B BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SCDGF-B, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCDGF-B BINDING SITE1 and SCDGF-B BINDING SITE2, designated SEQ ID:26985 and SEQ ID:24883 respectively, to the nucleotide sequence of VGAM1354 RNA, herein designated VGAM RNA, also designated SEQ ID:4065.

[47785] Another function of VGAM1354 is therefore inhibition of SCDGF-B (Accession NM_033135). Accordingly, utilities of VGAM1354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCDGF-B. LOC152742 (Accession XM_098259) is another VGAM1354 host target gene. LOC152742 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152742, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152742 BINDING SITE, designated SEQ ID:41545, to

the nucleotide sequence of VGAM1354 RNA, herein designated VGAM RNA, also designated SEQ ID:4065.

[47786] Another function of VGAM1354 is therefore inhibition of LOC152742 (Accession XM_098259). Accordingly, utilities of VGAM1354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152742. LOC153163 (Accession XM_087612) is another VGAM1354 host target gene. LOC153163 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153163, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153163 BINDING SITE, designated SEQ ID:39363, to the nucleotide sequence of VGAM1354 RNA, herein designated VGAM RNA, also designated SEQ ID:4065.

[47787] Another function of VGAM1354 is therefore inhibition of LOC153163 (Accession XM_087612). Accordingly, utilities of VGAM1354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153163. LOC196453 (Accession XM_118365) is another VGAM1354 host target gene. LOC196453 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC196453, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196453 BINDING SITE, designated SEQ ID:43577, to the nucleotide sequence of VGAM1354 RNA, herein designated VGAM RNA, also designated SEQ ID:4065.

[47788] Another function of VGAM1354 is therefore inhibition of LOC196453 (Accession XM_118365). Accordingly, utilities of VGAM1354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196453. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1355 (VGAM1355) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47789] VGAM1355 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1355 was detected is described hereinabove with reference to Figs. 1-8.

[47790] VGAM1355 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Triatoma Virus.

VGAM1355 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47791] VGAM1355 gene encodes a VGAM1355 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1355 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1355 precursor RNA is designated SEQ ID:1341, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1341 is located at position 3387 relative to the genome of Triatoma Virus.

[47792] VGAM1355 precursor RNA folds onto itself, forming VGAM1355 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47793] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1355 folded precursor RNA into VGAM1355 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1355 RNA is designated SEQ ID:4066, and is provided hereinbelow with reference to the sequence listing part.

[47794] VGAM1355 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1355 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1355 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[47795] VGAM1355 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1355 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1355 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1355 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1355 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[47796] The complementary binding of VGAM1355 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1355 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1355

host target RNA into VGAM1355 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47797] It is appreciated that VGAM1355 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1355 host target genes. The mRNA of each one of this plurality of VGAM1355 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1355 RNA, herein designated VGAM RNA, and which when bound by VGAM1355 RNA causes inhibition of translation of respective one or more VGAM1355 host target proteins.

[47798] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1355 gene, herein designated VGAM GENE, on one or more VGAM1355 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[47799] It is yet further appreciated that a function of VGAM1355 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1355 include diagnosis, prevention and treatment of viral infection by Triatoma Virus. Specific functions, and accordingly utilities, of VGAM1355 correlate with, and may be deduced from, the identity of the host target genes which VGAM1355 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47800] Nucleotide sequences of the VGAM1355 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1355 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1355 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1355 are further

described hereinbelow with reference to Table 1.

[47801] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1355 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1355 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47802] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1355 gene, herein designated VGAM is inhibition of expression of VGAM1355 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1355 correlate with, and may be deduced from, the identity of the target genes which VGAM1355 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[47803] UDP-Gal:betaGlcNAc Beta 1,3-galactosyltransferase, Polypeptide 2 (B3GALT2, Accession NM_003783) is a VGAM1355 host target gene. B3GALT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by B3GALT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of B3GALT2 BINDING SITE, designated SEQ ID:9870, to the nucleotide sequence of VGAM1355 RNA, herein designated VGAM RNA, also designated SEQ ID:4066.

[47804] A function of VGAM1355 is therefore inhibition of UDP-Gal:betaGlcNAc Beta 1,3-galactosyltransferase, Polypeptide 2 (B3GALT2, Accession NM_003783). Accordingly, utilities of VGAM1355 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B3GALT2. UDP-Gal:betaGlcNAc Beta 1,4- Galactosyltransferase, Polypeptide 4 (B4GALT4, Accession NM_003778) is another VGAM1355 host target gene. B4GALT4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by B4GALT4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of B4GALT4 BINDING SITE, designated SEQ ID:9860, to the nucleotide sequence of VGAM1355 RNA, herein designated VGAM RNA, also designated SEQ ID:4066.

[47805] Another function of VGAM1355 is therefore inhibition of UDP-Gal:betaGlcNAc Beta 1,4- Galactosyltransferase,

Polypeptide 4 (B4GALT4, Accession NM_003778). Accordingly, utilities of VGAM1355 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B4GALT4. Disrupted In Schizophrenia 1 (DISC1, Accession NM_018662) is another VGAM1355 host target gene. DISC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DISC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DISC1 BINDING SITE, designated SEQ ID:20738, to the nucleotide sequence of VGAM1355 RNA, herein designated VGAM RNA, also designated SEQ ID:4066.

[47806] Another function of VGAM1355 is therefore inhibition of Disrupted In Schizophrenia 1 (DISC1, Accession NM_018662), a gene which has globular N-terminal domain(s) and a helical C-terminal domain. Accordingly, utilities of VGAM1355 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DISC1. The function of DISC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with

reference to VGAM74.EGF-like-domain, Multiple 5 (EGFL5, Accession XM_098838) is another VGAM1355 host target gene. EGFL5 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by EGFL5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGFL5 BINDING SITE, designated SEQ ID:41882, to the nucleotide sequence of VGAM1355 RNA, herein designated VGAM RNA, also designated SEQ ID:4066.

[47807] Another function of VGAM1355 is therefore inhibition of EGF-like-domain, Multiple 5 (EGFL5, Accession XM_098838). Accordingly, utilities of VGAM1355 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGFL5. Homeo Box B6 (HOXB6, Accession XM_008560) is another VGAM1355 host target gene. HOXB6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HOXB6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HOXB6 BINDING SITE, des-

ignated SEQ ID:30087, to the nucleotide sequence of VGAM1355 RNA, herein designated VGAM RNA, also designated SEQ ID:4066.

[47808] Another function of VGAM1355 is therefore inhibition of Homeo Box B6 (HOXB6, Accession XM_008560), a gene which participates in establishing segmentation patterns and in determining segment identities. Accordingly, utilities of VGAM1355 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HOXB6. The function of HOXB6 has been established by previous studies. See 142960. To understand better the developmental significance of the murine Hox-2.2 gene (the homolog of human HOXB6, also symbolized HOX2B), Kaur et al. (1992) generated gain-of-function mutants by using the chicken beta-actin promoter to drive ubiquitous expression in transgenic mice. The resulting Hox-2.2 misexpression produced early postnatal lethality as well as craniofacial and axial skeletal perturbations that included open eyes at birth, cleft palate, micrognathia, microtia, skull bone deficiencies, and structural and positional alterations in the vertebral column. Complete or partial absence of the supraoccipital bone and malformations of the exoccipital and the basioccipital

bones were observed. By fluorescence in situ hybridization, Apiou et al. (1996) mapped the HOXB gene cluster precisely to 17q21.3.

[47809] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[47810] Apiou, F.; Flagiello, D.; Cillo, C.; Malfoy, B.; Poupon, M.-F.; Dutrillaux, B. : Fine mapping of human HOX gene clusters. *Cytogenet. Cell Genet.* 73: 114-115, 1996. ; and

[47811] Kaur, S.; Singh, G.; Stock, J. L.; Schreiner, C. M.; Kier, A. B.; Yager, K. L.; Mucenski, M. L.; Scott, W. J., Jr.; Potter, S. S. : Dominant mutation of the murine Hox-2.2 gene results.

[47812] Further studies establishing the function and utilities of HOXB6 are found in John Hopkins OMIM database record ID 142961, and in cited publications numbered 5223 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. DKFZP434G1415 (Accession NM_031292) is another VGAM1355 host target gene. DKFZP434G1415 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434G1415, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of DKFZP434G1415 BINDING SITE, designated SEQ ID:25314, to the nucleotide sequence of VGAM1355 RNA, herein designated VGAM RNA, also designated SEQ ID:4066.

[47813] Another function of VGAM1355 is therefore inhibition of DKFZP434G1415 (Accession NM_031292). Accordingly, utilities of VGAM1355 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434G1415. KIAA1958 (Accession XM_088566) is another VGAM1355 host target gene. KIAA1958 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1958, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1958 BINDING SITE, designated SEQ ID:39828, to the nucleotide sequence of VGAM1355 RNA, herein designated VGAM RNA, also designated SEQ ID:4066.

[47814] Another function of VGAM1355 is therefore inhibition of KIAA1958 (Accession XM_088566). Accordingly, utilities of VGAM1355 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1958. LOC153163 (Accession XM_087612) is another

VGAM1355 host target gene. LOC153163 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153163, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153163 BINDING SITE, designated SEQ ID:39362, to the nucleotide sequence of VGAM1355 RNA, herein designated VGAM RNA, also designated SEQ ID:4066.

[47815] Another function of VGAM1355 is therefore inhibition of LOC153163 (Accession XM_087612). Accordingly, utilities of VGAM1355 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153163. LOC200609 (Accession XM_117256) is another VGAM1355 host target gene. LOC200609 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC200609, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200609 BINDING SITE, designated SEQ ID:43325, to the nucleotide sequence of VGAM1355 RNA, herein designated VGAM RNA, also designated SEQ ID:4066.

[47816] Another function of VGAM1355 is therefore inhibition of LOC200609 (Accession XM_117256). Accordingly, utilities of VGAM1355 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200609. LOC202266 (Accession XM_117373) is another VGAM1355 host target gene. LOC202266 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC202266, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202266 BINDING SITE, designated SEQ ID:43419, to the nucleotide sequence of VGAM1355 RNA, herein designated VGAM RNA, also designated SEQ ID:4066.

[47817] Another function of VGAM1355 is therefore inhibition of LOC202266 (Accession XM_117373). Accordingly, utilities of VGAM1355 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202266. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1356 (VGAM1356) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[47818] VGAM1356 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1356 was detected is described hereinabove with reference to Figs. 1–8.

[47819] VGAM1356 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Triatoma Virus. VGAM1356 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47820] VGAM1356 gene encodes a VGAM1356 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1356 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1356 precursor RNA is designated SEQ ID:1342, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1342 is located at position 7993 relative to the genome of Triatoma Virus.

[47821] VGAM1356 precursor RNA folds onto itself, forming VGAM1356 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47822] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1356 folded precursor RNA into VGAM1356 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1356 RNA is designated SEQ ID:4067, and is provided hereinbelow with reference to the sequence listing part.

[47823] VGAM1356 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1356 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1356 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[47824] VGAM1356 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1356 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1356 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1356 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1356 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[47825] The complementary binding of VGAM1356 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1356 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1356 host target RNA into VGAM1356 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47826] It is appreciated that VGAM1356 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1356 host target genes. The mRNA of each one of this plurality of VGAM1356 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1356 RNA, herein designated VGAM RNA, and which when bound by VGAM1356 RNA causes inhibition of translation of respective one or more VGAM1356 host target proteins.

[47827] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1356 gene, herein designated VGAM GENE, on one or more VGAM1356 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[47828] It is yet further appreciated that a function of VGAM1356 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1356 include diagnosis, prevention and treatment of viral infection by Triatoma Virus. Specific functions, and accordingly utilities, of VGAM1356 correlate with, and may be deduced from, the identity of the host target genes which VGAM1356 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[47829] Nucleotide sequences of the VGAM1356 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1356 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1356 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1356 are further described hereinbelow with reference to Table 1.

[47830] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1356 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1356 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47831] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1356 gene, herein designated VGAM is inhibition of expression of VGAM1356 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1356 correlate with, and may be deduced from, the identity of the target genes which VGAM1356 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[47832] KIAA1348 (Accession XM_043826) is a VGAM1356 host target gene. KIAA1348 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1348, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1348 BINDING SITE, designated SEQ ID:34030, to the nucleotide sequence of VGAM1356 RNA, herein designated VGAM RNA, also designated SEQ ID:4067.

[47833] A function of VGAM1356 is therefore inhibition of KIAA1348 (Accession XM_043826). Accordingly, utilities of VGAM1356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1348. RAB39, Member RAS Oncogene Family (RAB39, Accession XM_084662) is another VGAM1356 host target gene. RAB39 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAB39, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB39 BINDING SITE, designated SEQ ID:37645, to the nucleotide sequence of VGAM1356 RNA,

herein designated VGAM RNA, also designated SEQ ID:4067.

[47834] Another function of VGAM1356 is therefore inhibition of RAB39, Member RAS Oncogene Family (RAB39, Accession XM_084662). Accordingly, utilities of VGAM1356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB39. LOC150630 (Accession XM_097931) is another VGAM1356 host target gene. LOC150630 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC150630, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150630 BINDING SITE, designated SEQ ID:41237, to the nucleotide sequence of VGAM1356 RNA, herein designated VGAM RNA, also designated SEQ ID:4067.

[47835] Another function of VGAM1356 is therefore inhibition of LOC150630 (Accession XM_097931). Accordingly, utilities of VGAM1356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150630. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 1357 (VGAM1357) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47836] VGAM1357 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1357 was detected is described hereinabove with reference to Figs. 1–8.

[47837] VGAM1357 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Triatoma Virus. VGAM1357 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47838] VGAM1357 gene encodes a VGAM1357 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1357 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1357 precursor RNA is designated SEQ ID:1343, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1343 is located at position 7136 relative to the

genome of Triatoma Virus.

[47839] VGAM1357 precursor RNA folds onto itself, forming VGAM1357 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47840] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1357 folded precursor RNA into VGAM1357 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1357 RNA is designated SEQ ID:4068, and is provided hereinbelow with reference to the sequence listing part.

[47841] VGAM1357 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1357 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1357 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[47842] VGAM1357 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1357 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1357 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1357 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1357 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[47843] The complementary binding of VGAM1357 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1357 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1357 host target RNA into VGAM1357 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47844] It is appreciated that VGAM1357 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1357 host target genes. The mRNA of each one of this plurality of VGAM1357 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1357 RNA, herein designated VGAM RNA, and which when bound by VGAM1357 RNA causes inhibition of translation of respective one or more VGAM1357 host target proteins.

[47845] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1357 gene, herein designated VGAM GENE, on one or more VGAM1357 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[47846] It is yet further appreciated that a function of VGAM1357 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1357 include diagnosis, prevention and treatment of viral infection by Triatoma Virus. Specific functions, and accordingly utilities, of VGAM1357 corre-

late with, and may be deduced from, the identity of the host target genes which VGAM1357 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47847] Nucleotide sequences of the VGAM1357 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1357 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1357 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1357 are further described hereinbelow with reference to Table 1.

[47848] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1357 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1357 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47849] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1357 gene, herein designated VGAM is inhibition of expression of VGAM1357 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1357 correlate with, and may be deduced

from, the identity of the target genes which VGAM1357 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[47850] 2'-5'-oligoadenylate Synthetase 3, 100kDa (OAS3, Accession NM_006187) is a VGAM1357 host target gene. OAS3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OAS3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OAS3 BINDING SITE, designated SEQ ID:12863, to the nucleotide sequence of VGAM1357 RNA, herein designated VGAM RNA, also designated SEQ ID:4068.

[47851] A function of VGAM1357 is therefore inhibition of 2'-5'-oligoadenylate Synthetase 3, 100kDa (OAS3, Accession NM_006187), a gene which may play a role in mediating resistance to virus infection, control of cell growth, differentiation, and apoptosis. Accordingly, utilities of VGAM1357 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OAS3. The function of OAS3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to VGAM309. Chromosome 1 Open Reading Frame 9 (C1orf9, Accession NM_016227) is another VGAM1357 host target gene. C1orf9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C1orf9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1orf9 BINDING SITE, designated SEQ ID:18341, to the nucleotide sequence of VGAM1357 RNA, herein designated VGAM RNA, also designated SEQ ID:4068.

[47852] Another function of VGAM1357 is therefore inhibition of Chromosome 1 Open Reading Frame 9 (C1orf9, Accession NM_016227). Accordingly, utilities of VGAM1357 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf9. ENDOFIN (Accession NM_014733) is another VGAM1357 host target gene. ENDOFIN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ENDOFIN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ENDOFIN BINDING SITE, designated SEQ

ID:16369, to the nucleotide sequence of VGAM1357 RNA, herein designated VGAM RNA, also designated SEQ ID:4068.

[47853] Another function of VGAM1357 is therefore inhibition of ENDOFIN (Accession NM_014733). Accordingly, utilities of VGAM1357 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ENDOFIN. FLJ10607 (Accession XM_085119) is another VGAM1357 host target gene. FLJ10607 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10607, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10607 BINDING SITE, designated SEQ ID:37831, to the nucleotide sequence of VGAM1357 RNA, herein designated VGAM RNA, also designated SEQ ID:4068.

[47854] Another function of VGAM1357 is therefore inhibition of FLJ10607 (Accession XM_085119). Accordingly, utilities of VGAM1357 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10607. KIAA0332 (Accession XM_031553) is another VGAM1357 host target gene. KIAA0332 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0332, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0332 BINDING SITE, designated SEQ ID:31424, to the nucleotide sequence of VGAM1357 RNA, herein designated VGAM RNA, also designated SEQ ID:4068.

[47855] Another function of VGAM1357 is therefore inhibition of KIAA0332 (Accession XM_031553). Accordingly, utilities of VGAM1357 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0332. NBR2 (Accession NM_005821) is another VGAM1357 host target gene. NBR2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NBR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NBR2 BINDING SITE, designated SEQ ID:12422, to the nucleotide sequence of VGAM1357 RNA, herein designated VGAM RNA, also designated SEQ ID:4068.

[47856] Another function of VGAM1357 is therefore inhibition of

NBR2 (Accession NM_005821). Accordingly, utilities of VGAM1357 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NBR2. Zinc Finger, DHHC Domain Containing 2 (ZDHHC2, Accession NM_016353) is another VGAM1357 host target gene. ZDHHC2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZDHHC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZDHHC2 BINDING SITE, designated SEQ ID:18491, to the nucleotide sequence of VGAM1357 RNA, herein designated VGAM RNA, also designated SEQ ID:4068.

[47857] Another function of VGAM1357 is therefore inhibition of Zinc Finger, DHHC Domain Containing 2 (ZDHHC2, Accession NM_016353). Accordingly, utilities of VGAM1357 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZDHHC2. LOC128338 (Accession XM_059238) is another VGAM1357 host target gene. LOC128338 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC128338, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC128338 BINDING SITE, designated SEQ ID:36926, to the nucleotide sequence of VGAM1357 RNA, herein designated VGAM RNA, also designated SEQ ID:4068.

[47858] Another function of VGAM1357 is therefore inhibition of LOC128338 (Accession XM_059238). Accordingly, utilities of VGAM1357 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC128338. LOC253981 (Accession XM_171064) is another VGAM1357 host target gene. LOC253981 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253981, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253981 BINDING SITE, designated SEQ ID:45869, to the nucleotide sequence of VGAM1357 RNA, herein designated VGAM RNA, also designated SEQ ID:4068.

[47859] Another function of VGAM1357 is therefore inhibition of LOC253981 (Accession XM_171064). Accordingly, utilities of VGAM1357 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC253981. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1358 (VGAM1358) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47860] VGAM1358 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1358 was detected is described hereinabove with reference to Figs. 1–8.

[47861] VGAM1358 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Triatoma Virus. VGAM1358 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47862] VGAM1358 gene encodes a VGAM1358 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1358 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1358 precursor RNA is desig-

nated SEQ ID:1344, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1344 is located at position 8558 relative to the genome of Triatoma Virus.

- [47863] VGAM1358 precursor RNA folds onto itself, forming VGAM1358 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [47864] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1358 folded precursor RNA into VGAM1358 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1358 RNA is designated SEQ ID:4069, and is provided hereinbelow with reference to the sequence

listing part.

[47865] VGAM1358 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1358 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1358 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[47866] VGAM1358 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1358 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1358 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1358 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM1358 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[47867] The complementary binding of VGAM1358 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1358 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1358 host target RNA into VGAM1358 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47868] It is appreciated that VGAM1358 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1358 host target genes. The mRNA of each one of this plurality of VGAM1358 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1358 RNA, herein designated VGAM

RNA, and which when bound by VGAM1358 RNA causes inhibition of translation of respective one or more VGAM1358 host target proteins.

[47869] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1358 gene, herein designated VGAM GENE, on one or more VGAM1358 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[47870] It is yet further appreciated that a function of VGAM1358 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1358 include diagnosis, prevention and treatment of viral infection by Triatoma Virus. Specific functions, and accordingly utilities, of VGAM1358 correlate with, and may be deduced from, the identity of the host target genes which VGAM1358 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47871] Nucleotide sequences of the VGAM1358 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1358 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1358 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1358 are further described hereinbelow with reference to Table 1.

[47872] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1358 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1358 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47873] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1358 gene, herein designated VGAM is

inhibition of expression of VGAM1358 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1358 correlate with, and may be deduced from, the identity of the target genes which VGAM1358 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[47874] Dishevelled, Dsh Homolog 3 (Drosophila) (DVL3, Accession NM_004423) is a VGAM1358 host target gene. DVL3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DVL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DVL3 BINDING SITE, designated SEQ ID:10688, to the nucleotide sequence of VGAM1358 RNA, herein designated VGAM RNA, also designated SEQ ID:4069.

[47875] A function of VGAM1358 is therefore inhibition of Dishevelled, Dsh Homolog 3 (Drosophila) (DVL3, Accession NM_004423), a gene which regulates cell proliferation. Accordingly, utilities of VGAM1358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DVL3. The function of DVL3 and its association with various diseases and clinical conditions,

has been established by previous studies, as described hereinabove with reference to VGAM57.FLJ10244 (Accession NM_018037) is another VGAM1358 host target gene. FLJ10244 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10244, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10244 BINDING SITE, designated SEQ ID:19778, to the nucleotide sequence of VGAM1358 RNA, herein designated VGAM RNA, also designated SEQ ID:4069.

[47876] Another function of VGAM1358 is therefore inhibition of FLJ10244 (Accession NM_018037). Accordingly, utilities of VGAM1358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10244. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1359 (VGAM1359) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47877] VGAM1359 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1359 was detected is described hereinabove with reference to Figs. 1-8.

[47878] VGAM1359 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Triatoma Virus. VGAM1359 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47879] VGAM1359 gene encodes a VGAM1359 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1359 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1359 precursor RNA is designated SEQ ID:1345, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1345 is located at position 2393 relative to the genome of Triatoma Virus.

[47880] VGAM1359 precursor RNA folds onto itself, forming VGAM1359 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47881] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1359 folded precursor RNA into VGAM1359 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of VGAM1359 RNA is designated SEQ ID:4070, and is provided hereinbelow with reference to the sequence listing part.

[47882] VGAM1359 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1359 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1359 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[47883] VGAM1359 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1359 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1359 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1359 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1359 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[47884] The complementary binding of VGAM1359 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1359 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1359 host target RNA into VGAM1359 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47885] It is appreciated that VGAM1359 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1359 host target genes. The mRNA of each one of this plurality of VGAM1359 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1359 RNA, herein designated VGAM RNA, and which when bound by VGAM1359 RNA causes inhibition of translation of respective one or more VGAM1359 host target proteins.

[47886] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1359 gene, herein designated VGAM GENE, on one or more VGAM1359 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[47887] It is yet further appreciated that a function of VGAM1359 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1359 include diagnosis, prevention and treatment of viral infection by Triatoma Virus. Specific functions, and accordingly utilities, of VGAM1359 correlate with, and may be deduced from, the identity of the host target genes which VGAM1359 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47888] Nucleotide sequences of the VGAM1359 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the
`diced` VGAM1359 RNA, herein designated VGAM RNA,
and a schematic representation of the secondary folding
of VGAM1359 folded precursor RNA, herein designated
VGAM FOLDED PRECURSOR RNA, of VGAM1359 are further
described hereinbelow with reference to Table 1.

[47889] Nucleotide sequences of host target binding sites, such as
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of
Fig. 1, found on VGAM1359 host target RNA, and
schematic representation of the complementarity of each
of these host target binding sites to VGAM1359 RNA,
herein designated VGAM RNA, are described hereinbelow
with reference to Table 2.

[47890] As mentioned hereinabove with reference to Fig. 1, a
function of VGAM1359 gene, herein designated VGAM is
inhibition of expression of VGAM1359 target genes. It is
appreciated that specific functions, and accordingly utili-
ties, of VGAM1359 correlate with, and may be deduced
from, the identity of the target genes which VGAM1359
binds and inhibits, and the function of these target genes,
as elaborated hereinbelow.

[47891] Microtubule-associated Protein, RP/EB Family, Member 1
(MAPRE1, Accession NM_012325) is a VGAM1359 host

target gene. MAPRE1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAPRE1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAPRE1 BINDING SITE, designated SEQ ID:14709, to the nucleotide sequence of VGAM1359 RNA, herein designated VGAM RNA, also designated SEQ ID:4070.

[47892] A function of VGAM1359 is therefore inhibition of Microtubule-associated Protein, RP/EB Family, Member 1 (MAPRE1, Accession NM_012325). Accordingly, utilities of VGAM1359 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPRE1. Mannose-binding Lectin (protein C) 2, Soluble (opsonic defect) (MBL2, Accession NM_000242) is another VGAM1359 host target gene. MBL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MBL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MBL2 BINDING SITE, designated SEQ ID:5765, to the nucleotide sequence of

VGAM1359 RNA, herein designated VGAM RNA, also designated SEQ ID:4070.

[47893] Another function of VGAM1359 is therefore inhibition of Mannose-binding Lectin (protein C) 2, Soluble (opsonic defect) (MBL2, Accession NM_000242). Accordingly, utilities of VGAM1359 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MBL2. Polycystic Kidney Disease 2 (autosomal dominant) (PKD2, Accession XM_011124) is another VGAM1359 host target gene. PKD2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PKD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PKD2 BINDING SITE, designated SEQ ID:30178, to the nucleotide sequence of VGAM1359 RNA, herein designated VGAM RNA, also designated SEQ ID:4070.

[47894] Another function of VGAM1359 is therefore inhibition of Polycystic Kidney Disease 2 (autosomal dominant) (PKD2, Accession XM_011124). Accordingly, utilities of VGAM1359 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PKD2.

DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 33 (DDX33, Accession NM_020162) is another VGAM1359 host target gene. DDX33 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DDX33, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDX33 BINDING SITE, designated SEQ ID:21377, to the nucleotide sequence of VGAM1359 RNA, herein designated VGAM RNA, also designated SEQ ID:4070.

[47895] Another function of VGAM1359 is therefore inhibition of DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 33 (DDX33, Accession NM_020162). Accordingly, utilities of VGAM1359 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDX33. FLJ13491 (Accession NM_024623) is another VGAM1359 host target gene. FLJ13491 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13491, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13491 BINDING SITE,

designated SEQ ID:23889, to the nucleotide sequence of VGAM1359 RNA, herein designated VGAM RNA, also designated SEQ ID:4070.

[47896] Another function of VGAM1359 is therefore inhibition of FLJ13491 (Accession NM_024623). Accordingly, utilities of VGAM1359 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13491. KIAA1915 (Accession XM_055481) is another VGAM1359 host target gene. KIAA1915 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1915, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1915 BINDING SITE, designated SEQ ID:36271, to the nucleotide sequence of VGAM1359 RNA, herein designated VGAM RNA, also designated SEQ ID:4070.

[47897] Another function of VGAM1359 is therefore inhibition of KIAA1915 (Accession XM_055481). Accordingly, utilities of VGAM1359 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1915. NXP-2 (Accession XM_048706) is another VGAM1359 host target gene. NXP-2 BINDING SITE is HOST

TARGET binding site found in the 3' untranslated region of mRNA encoded by NXP-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NXP-2 BINDING SITE, designated SEQ ID:35231, to the nucleotide sequence of VGAM1359 RNA, herein designated VGAM RNA, also designated SEQ ID:4070.

[47898] Another function of VGAM1359 is therefore inhibition of NXP-2 (Accession XM_048706). Accordingly, utilities of VGAM1359 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NXP-2. Zinc Finger Protein 33a (KOX 31) (ZNF33A, Accession XM_166119) is another VGAM1359 host target gene. ZNF33A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF33A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF33A BINDING SITE, designated SEQ ID:43902, to the nucleotide sequence of VGAM1359 RNA, herein designated VGAM RNA, also designated SEQ ID:4070.

[47899] Another function of VGAM1359 is therefore inhibition of Zinc Finger Protein 33a (K0X 31) (ZNF33A, Accession XM_166119). Accordingly, utilities of VGAM1359 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF33A. LOC157226 (Accession XM_033876) is another VGAM1359 host target gene. LOC157226 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC157226, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157226 BINDING SITE, designated SEQ ID:31977, to the nucleotide sequence of VGAM1359 RNA, herein designated VGAM RNA, also designated SEQ ID:4070.

[47900] Another function of VGAM1359 is therefore inhibition of LOC157226 (Accession XM_033876). Accordingly, utilities of VGAM1359 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157226. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1360 (VGAM1360) viral gene, which

modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47901] VGAM1360 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1360 was detected is described hereinabove with reference to Figs. 1–8.

[47902] VGAM1360 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Triatoma Virus. VGAM1360 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47903] VGAM1360 gene encodes a VGAM1360 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1360 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1360 precursor RNA is designated SEQ ID:1346, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1346 is located at position 6392 relative to the genome of Triatoma Virus.

[47904] VGAM1360 precursor RNA folds onto itself, forming

VGAM1360 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47905] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1360 folded precursor RNA into VGAM1360 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM1360 RNA is designated SEQ ID:4071, and is provided hereinbelow with reference to the sequence listing part.

[47906] VGAM1360 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1360 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1360 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[47907] VGAM1360 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1360 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1360 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1360 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1360 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[47908] The complementary binding of VGAM1360 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1360 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1360 host target RNA into VGAM1360 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47909] It is appreciated that VGAM1360 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1360 host target genes. The mRNA of each one of this plurality of VGAM1360 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1360 RNA, herein designated VGAM RNA, and which when bound by VGAM1360 RNA causes inhibition of translation of respective one or more VGAM1360 host target proteins.

[47910] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1360 gene, herein designated VGAM GENE, on one or more VGAM1360 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[47911] It is yet further appreciated that a function of VGAM1360 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1360 include diagnosis, prevention and treatment of viral infection by Triatoma Virus. Specific functions, and accordingly utilities, of VGAM1360 correlate with, and may be deduced from, the identity of the host target genes which VGAM1360 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47912] Nucleotide sequences of the VGAM1360 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1360 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1360 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1360 are further described hereinbelow with reference to Table 1.

[47913] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM1360 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1360 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47914] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1360 gene, herein designated VGAM is inhibition of expression of VGAM1360 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1360 correlate with, and may be deduced from, the identity of the target genes which VGAM1360 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[47915] PART1 (Accession NM_016590) is a VGAM1360 host target gene. PART1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PART1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PART1 BINDING SITE, designated SEQ ID:18665, to the nucleotide sequence of VGAM1360 RNA, herein designated VGAM RNA, also designated SEQ ID:4071.

[47916] A function of VGAM1360 is therefore inhibition of PART1 (Accession NM_016590). Accordingly, utilities of VGAM1360 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PART1. Glutamate Receptor, Ionotropic, N-methyl-D-aspartate 3A (GRIN3A, Accession NM_133445) is another VGAM1360 host target gene. GRIN3A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GRIN3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRIN3A BINDING SITE, designated SEQ ID:28537, to the nucleotide sequence of VGAM1360 RNA, herein designated VGAM RNA, also designated SEQ ID:4071.

[47917] Another function of VGAM1360 is therefore inhibition of Glutamate Receptor, Ionotropic, N-methyl-D-aspartate 3A (GRIN3A, Accession NM_133445). Accordingly, utilities of VGAM1360 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRIN3A. KIAA0218 (Accession NM_014760) is another VGAM1360 host target gene. KIAA0218 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA0218, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0218 BINDING SITE, designated SEQ ID:16518, to the nucleotide sequence of VGAM1360 RNA, herein designated VGAM RNA, also designated SEQ ID:4071.

[47918] Another function of VGAM1360 is therefore inhibition of KIAA0218 (Accession NM_014760). Accordingly, utilities of VGAM1360 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0218. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1361 (VGAM1361) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47919] VGAM1361 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1361 was detected is described hereinabove with reference to Figs. 1-8.

[47920] VGAM1361 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Triatoma Virus.

VGAM1361 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47921] VGAM1361 gene encodes a VGAM1361 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1361 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1361 precursor RNA is designated SEQ ID:1347, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1347 is located at position 5836 relative to the genome of Triatoma Virus.

[47922] VGAM1361 precursor RNA folds onto itself, forming VGAM1361 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47923] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1361 folded precursor RNA into VGAM1361 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1361 RNA is designated SEQ ID:4072, and is provided hereinbelow with reference to the sequence listing part.

[47924] VGAM1361 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1361 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1361 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[47925] VGAM1361 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1361 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1361 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1361 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1361 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[47926] The complementary binding of VGAM1361 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1361 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1361

host target RNA into VGAM1361 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47927] It is appreciated that VGAM1361 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1361 host target genes. The mRNA of each one of this plurality of VGAM1361 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1361 RNA, herein designated VGAM RNA, and which when bound by VGAM1361 RNA causes inhibition of translation of respective one or more VGAM1361 host target proteins.

[47928] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1361 gene, herein designated VGAM GENE, on one or more VGAM1361 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[47929] It is yet further appreciated that a function of VGAM1361 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1361 include diagnosis, prevention and treatment of viral infection by Triatoma Virus. Specific functions, and accordingly utilities, of VGAM1361 correlate with, and may be deduced from, the identity of the host target genes which VGAM1361 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47930] Nucleotide sequences of the VGAM1361 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1361 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1361 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1361 are further

described hereinbelow with reference to Table 1.

[47931] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1361 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1361 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47932] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1361 gene, herein designated VGAM is inhibition of expression of VGAM1361 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1361 correlate with, and may be deduced from, the identity of the target genes which VGAM1361 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[47933] BUB3 Budding Uninhibited By Benzimidazoles 3 Homolog (yeast) (BUB3, Accession NM_004725) is a VGAM1361 host target gene. BUB3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BUB3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of BUB3 BINDING SITE, designated SEQ ID:11096, to the nucleotide sequence of VGAM1361 RNA, herein designated VGAM RNA, also designated SEQ ID:4072.

[47934] A function of VGAM1361 is therefore inhibition of BUB3 Budding Uninhibited By Benzimidazoles 3 Homolog (yeast) (BUB3, Accession NM_004725), a gene which has a role in the mitotic spindle checkpoint. Accordingly, utilities of VGAM1361 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BUB3. The function of BUB3 has been established by previous studies. A feedback control mechanism, or cell cycle checkpoint, delays the onset of anaphase until all the chromosomes are correctly aligned on the mitotic spindle. Mutations in the *S. cerevisiae* BUB and MAD genes abolish this checkpoint, such that mutant cells fail to undergo mitotic arrest in response to spindle damage. The yeast BUB1 (see OMIM Ref. No. 602452) gene encodes a protein kinase that can bind and phosphorylate BUB3. Mammalian BUB1 localizes to the kinetochore of unaligned chromosomes. To further characterize the role of BUB1 in mitosis, Taylor et al. (1998) searched an EST database to identify the human homolog of BUB3. They identified a partial hu-

man BUB3 cDNA and used a PCR strategy to isolate a full-length cDNA. The predicted 328-amino acid human protein shares approximately 34% identity with yeast BUB3. Both proteins contain 4 WD repeats. When expressed in mammalian cells, a chimeric GFP-BUB3 protein localized to kinetochores before chromosome alignment. Using deletion analysis, the authors identified a domain of BUB1 that is required both for binding BUB3 and for kinetochore localization of BUB1. Taylor et al. (1998) reported that a similar domain in BUBR1 (OMIM Ref. No. 602860) mediates binding to BUB3. They suggested that the BUB and MAD proteins may be part of a large protein complex that is recruited to unattached kinetochores and that dissociates from kinetochores upon achieving correct bipolar attachment. Animal model experiments lend further support to the function of BUB3. By gene-targeting techniques, Kalitsis et al. (2000) disrupted the Bub3 gene in mice, which resulted in embryonic lethality prior to day 8.5 postcoitum (pc) in homozygous mutants. Mutant embryos appeared normal at day 3.5 pc but rapidly degenerated. An observed accumulation of mitotic errors suggested that Bub3 is essential for normal mitosis and for early embryonic development in the mouse.

[47935] It is appreciated that the abovementioned animal model for BUB3 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[47936] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[47937] Kalitsis, P.; Earle, E.; Fowler, K. J.; Choo, K. H. A. : Bub3 gene disruption in mice reveals essential mitotic spindle checkpoint function during early embryogenesis. *Genes Dev.* 14: 2277–2282, 2000. ; and

[47938] Taylor, S. S.; Ha, E.; McKeon, F. : The human homologue of Bub3 is required for kinetochore localization of Bub1 and a Mad3/Bub1–related protein kinase. *J. Cell Biol.* 142: 1–11, 1998.

[47939] Further studies establishing the function and utilities of BUB3 are found in John Hopkins OMIM database record ID 603719, and in cited publications numbered 275 and 5362 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Nuclear RNA Export Factor 2 (NXF2, Accession NM_017809) is another VGAM1361 host target gene. NXF2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region

of mRNA encoded by NXF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NXF2 BINDING SITE, designated SEQ ID:19457, to the nucleotide sequence of VGAM1361 RNA, herein designated VGAM RNA, also designated SEQ ID:4072.

[47940] Another function of VGAM1361 is therefore inhibition of Nuclear RNA Export Factor 2 (NXF2, Accession NM_017809), a gene which is involved in the export of mrna from the nucleus to the cytoplasm. Accordingly, utilities of VGAM1361 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NXF2. The function of NXF2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM595. Ribosomal Protein S6 Kinase, 90kDa, Polypeptide 5 (RPS6KA5, Accession NM_004755) is another VGAM1361 host target gene. RPS6KA5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RPS6KA5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of RPS6KA5 BINDING SITE, designated SEQ ID:11141, to the nucleotide sequence of VGAM1361 RNA, herein designated VGAM RNA, also designated SEQ ID:4072.

[47941] Another function of VGAM1361 is therefore inhibition of Ribosomal Protein S6 Kinase, 90kDa, Polypeptide 5 (RPS6KA5, Accession NM_004755), a gene which plays an essential role in the proliferation of yeast cells. Accordingly, utilities of VGAM1361 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPS6KA5. The function of RPS6KA5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM191. Zinc Finger Protein 2 (A1-5) (ZNF2, Accession NM_021088) is another VGAM1361 host target gene. ZNF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF2 BINDING SITE, designated SEQ ID:22066, to the nucleotide sequence of VGAM1361 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4072.

[47942] Another function of VGAM1361 is therefore inhibition of Zinc Finger Protein 2 (A1-5) (ZNF2, Accession NM_021088). Accordingly, utilities of VGAM1361 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF2. FLJ11004 (Accession NM_018296) is another VGAM1361 host target gene. FLJ11004 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ11004, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11004 BINDING SITE, designated SEQ ID:20287, to the nucleotide sequence of VGAM1361 RNA, herein designated VGAM RNA, also designated SEQ ID:4072.

[47943] Another function of VGAM1361 is therefore inhibition of FLJ11004 (Accession NM_018296). Accordingly, utilities of VGAM1361 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11004. MOST2 (Accession NM_020250) is another VGAM1361 host target gene. MOST2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by MOST2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MOST2 BINDING SITE, designated SEQ ID:21555, to the nucleotide sequence of VGAM1361 RNA, herein designated VGAM RNA, also designated SEQ ID:4072.

[47944] Another function of VGAM1361 is therefore inhibition of MOST2 (Accession NM_020250). Accordingly, utilities of VGAM1361 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MOST2. Ras Protein-specific Guanine Nucleotide-releasing Factor 2 (RASGRF2, Accession XM_027943) is another VGAM1361 host target gene. RASGRF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RASGRF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RASGRF2 BINDING SITE, designated SEQ ID:30596, to the nucleotide sequence of VGAM1361 RNA, herein designated VGAM RNA, also designated SEQ ID:4072.

[47945] Another function of VGAM1361 is therefore inhibition of

Ras Protein-specific Guanine Nucleotide-releasing Factor 2 (RASGRF2, Accession XM_027943). Accordingly, utilities of VGAM1361 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RASGRF2. LOC219688 (Accession XM_167568) is another VGAM1361 host target gene. LOC219688 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC219688, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219688 BINDING SITE, designated SEQ ID:44696, to the nucleotide sequence of VGAM1361 RNA, herein designated VGAM RNA, also designated SEQ ID:4072.

[47946] Another function of VGAM1361 is therefore inhibition of LOC219688 (Accession XM_167568). Accordingly, utilities of VGAM1361 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219688. LOC221663 (Accession XM_168131) is another VGAM1361 host target gene. LOC221663 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221663, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221663 BINDING SITE, designated SEQ ID:45037, to the nucleotide sequence of VGAM1361 RNA, herein designated VGAM RNA, also designated SEQ ID:4072.

[47947] Another function of VGAM1361 is therefore inhibition of LOC221663 (Accession XM_168131). Accordingly, utilities of VGAM1361 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221663. LOC51336 (Accession NM_016646) is another VGAM1361 host target gene. LOC51336 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC51336, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51336 BINDING SITE, designated SEQ ID:18752, to the nucleotide sequence of VGAM1361 RNA, herein designated VGAM RNA, also designated SEQ ID:4072.

[47948] Another function of VGAM1361 is therefore inhibition of LOC51336 (Accession NM_016646). Accordingly, utilities of VGAM1361 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC51336. LOC90670 (Accession XM_033352) is another VGAM1361 host target gene. LOC90670 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90670, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90670 BINDING SITE, designated SEQ ID:31885, to the nucleotide sequence of VGAM1361 RNA, herein designated VGAM RNA, also designated SEQ ID:4072.

[47949] Another function of VGAM1361 is therefore inhibition of LOC90670 (Accession XM_033352). Accordingly, utilities of VGAM1361 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90670. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1362 (VGAM1362) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47950] VGAM1362 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1362 was detected is described hereinabove with reference to Figs. 1–8.

[47951] VGAM1362 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Duck Adenovirus 1.

VGAM1362 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47952] VGAM1362 gene encodes a VGAM1362 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1362 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1362 precursor RNA is designated SEQ ID:1348, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1348 is located at position 12491 relative to the genome of Duck Adenovirus 1.

[47953] VGAM1362 precursor RNA folds onto itself, forming VGAM1362 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide

sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47954] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1362 folded precursor RNA into VGAM1362 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM1362 RNA is designated SEQ ID:4073, and is provided hereinbelow with reference to the sequence listing part.

[47955] VGAM1362 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1362 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1362 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[47956] VGAM1362 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1362 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1362 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1362 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1362 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[47957] The complementary binding of VGAM1362 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1362 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1362 host target RNA into VGAM1362 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47958] It is appreciated that VGAM1362 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1362 host target genes. The mRNA of each one of this plurality of VGAM1362 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1362 RNA, herein designated VGAM RNA, and which when bound by VGAM1362 RNA causes inhibition of translation of respective one or more VGAM1362 host target proteins.

[47959] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1362 gene, herein designated VGAM GENE, on one or more VGAM1362 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[47960] It is yet further appreciated that a function of VGAM1362 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1362 include diagnosis, prevention and treatment of viral infection by Duck Adenovirus 1. Specific functions, and accordingly utilities, of VGAM1362 correlate with, and may be deduced from, the identity of the host target genes which VGAM1362 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47961] Nucleotide sequences of the VGAM1362 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1362 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM1362 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1362 are further described hereinbelow with reference to Table 1.

[47962] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1362 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1362 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47963] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1362 gene, herein designated VGAM is inhibition of expression of VGAM1362 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1362 correlate with, and may be deduced from, the identity of the target genes which VGAM1362 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[47964] BS69 (Accession NM_006624) is a VGAM1362 host target gene. BS69 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BS69, corresponding to a HOST TARGET binding site such

as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BS69 BINDING SITE, designated SEQ ID:13406, to the nucleotide sequence of VGAM1362 RNA, herein designated VGAM RNA, also designated SEQ ID:4073.

[47965] A function of VGAM1362 is therefore inhibition of BS69 (Accession NM_006624). Accordingly, utilities of VGAM1362 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BS69. FLJ23590 (Accession NM_024649) is another VGAM1362 host target gene. FLJ23590 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23590, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23590 BINDING SITE, designated SEQ ID:23939, to the nucleotide sequence of VGAM1362 RNA, herein designated VGAM RNA, also designated SEQ ID:4073.

[47966] Another function of VGAM1362 is therefore inhibition of FLJ23590 (Accession NM_024649). Accordingly, utilities of VGAM1362 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ23590. KIAA0993 (Accession XM_034413) is another VGAM1362 host target gene. KIAA0993 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0993, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0993 BINDING SITE, designated SEQ ID:32075, to the nucleotide sequence of VGAM1362 RNA, herein designated VGAM RNA, also designated SEQ ID:4073.

[47967] Another function of VGAM1362 is therefore inhibition of KIAA0993 (Accession XM_034413). Accordingly, utilities of VGAM1362 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0993. LOC222001 (Accession XM_167489) is another VGAM1362 host target gene. LOC222001 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222001, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222001 BINDING SITE, designated SEQ ID:44642, to the nucleotide sequence of VGAM1362 RNA, herein design-

nated VGAM RNA, also designated SEQ ID:4073.

[47968] Another function of VGAM1362 is therefore inhibition of LOC222001 (Accession XM_167489). Accordingly, utilities of VGAM1362 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222001. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1363 (VGAM1363) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47969] VGAM1363 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1363 was detected is described hereinabove with reference to Figs. 1–8.

[47970] VGAM1363 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Duck Adenovirus 1. VGAM1363 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47971] VGAM1363 gene encodes a VGAM1363 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM1363 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1363 precursor RNA is designated SEQ ID:1349, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1349 is located at position 14923 relative to the genome of Duck Adenovirus 1.

[47972] VGAM1363 precursor RNA folds onto itself, forming VGAM1363 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47973] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1363 folded precursor RNA into VGAM1363 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM1363 RNA is designated SEQ ID:4074, and is provided hereinbelow with reference to the sequence listing part.

[47974] VGAM1363 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1363 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1363 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[47975] VGAM1363 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1363 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1363 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1363 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1363 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[47976] The complementary binding of VGAM1363 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1363 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1363 host target RNA into VGAM1363 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47977] It is appreciated that VGAM1363 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1363 host target genes. The mRNA of

each one of this plurality of VGAM1363 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1363 RNA, herein designated VGAM RNA, and which when bound by VGAM1363 RNA causes inhibition of translation of respective one or more VGAM1363 host target proteins.

[47978] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1363 gene, herein designated VGAM GENE, on one or more VGAM1363 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[47979] It is yet further appreciated that a function of VGAM1363 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1363 include diagnosis, prevention and treatment of viral infection by Duck Adenovirus 1. Specific functions, and accordingly utilities, of VGAM1363 correlate with, and may be deduced from, the identity of the host target genes which VGAM1363 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47980] Nucleotide sequences of the VGAM1363 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1363 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1363 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1363 are further described hereinbelow with reference to Table 1.

[47981] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1363 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1363 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47982] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1363 gene, herein designated VGAM is inhibition of expression of VGAM1363 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1363 correlate with, and may be deduced from, the identity of the target genes which VGAM1363 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[47983] Transcription Factor 7 (T-cell specific, HMG-box) (TCF7, Accession NM_003202) is a VGAM1363 host target gene. TCF7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TCF7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCF7 BINDING SITE, designated SEQ ID:9193, to the nucleotide sequence of VGAM1363 RNA, herein designated VGAM RNA, also designated SEQ ID:4074.

[47984] A function of VGAM1363 is therefore inhibition of Transcription Factor 7 (T-cell specific, HMG-box) (TCF7, Accession NM_003202). Accordingly, utilities of VGAM1363

include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCF7. Ras Homolog Gene Family, Member U (ARHU, Accession NM_021205) is another VGAM1363 host target gene. ARHU BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARHU, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHU BINDING SITE, designated SEQ ID:22179, to the nucleotide sequence of VGAM1363 RNA, herein designated VGAM RNA, also designated SEQ ID:4074.

[47985] Another function of VGAM1363 is therefore inhibition of Ras Homolog Gene Family, Member U (ARHU, Accession NM_021205). Accordingly, utilities of VGAM1363 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHU. KIAA0194 (Accession XM_038362) is another VGAM1363 host target gene. KIAA0194 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0194, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of KIAA0194 BINDING SITE, designated SEQ ID:32826, to the nucleotide sequence of VGAM1363 RNA, herein designated VGAM RNA, also designated SEQ ID:4074.

[47986] Another function of VGAM1363 is therefore inhibition of KIAA0194 (Accession XM_038362). Accordingly, utilities of VGAM1363 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0194. KIAA0222 (Accession NM_014643) is another VGAM1363 host target gene. KIAA0222 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0222, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0222 BINDING SITE, designated SEQ ID:16044, to the nucleotide sequence of VGAM1363 RNA, herein designated VGAM RNA, also designated SEQ ID:4074.

[47987] Another function of VGAM1363 is therefore inhibition of KIAA0222 (Accession NM_014643). Accordingly, utilities of VGAM1363 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0222. Progesterone Receptor Membrane Component

2 (PGRMC2, Accession NM_006320) is another VGAM1363 host target gene. PGRMC2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PGRMC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PGRMC2 BINDING SITE, designated SEQ ID:13011, to the nucleotide sequence of VGAM1363 RNA, herein designated VGAM RNA, also designated SEQ ID:4074.

[47988] Another function of VGAM1363 is therefore inhibition of Progesterone Receptor Membrane Component 2 (PGRMC2, Accession NM_006320). Accordingly, utilities of VGAM1363 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PGRMC2. SAM Domain and HD Domain 1 (SAMHD1, Accession XM_028704) is another VGAM1363 host target gene. SAMHD1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SAMHD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SAMHD1 BINDING SITE, designated SEQ

ID:30734, to the nucleotide sequence of VGAM1363 RNA, herein designated VGAM RNA, also designated SEQ ID:4074.

[47989] Another function of VGAM1363 is therefore inhibition of SAM Domain and HD Domain 1 (SAMHD1, Accession XM_028704). Accordingly, utilities of VGAM1363 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SAMHD1. TSPEAR (Accession NM_144991) is another VGAM1363 host target gene. TSPEAR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TSPEAR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TSPEAR BINDING SITE, designated SEQ ID:29596, to the nucleotide sequence of VGAM1363 RNA, herein designated VGAM RNA, also designated SEQ ID:4074.

[47990] Another function of VGAM1363 is therefore inhibition of TSPEAR (Accession NM_144991). Accordingly, utilities of VGAM1363 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TSPEAR. LOC148529 (Accession XM_097481) is another

VGAM1363 host target gene. LOC148529 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148529, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148529 BINDING SITE, designated SEQ ID:40890, to the nucleotide sequence of VGAM1363 RNA, herein designated VGAM RNA, also designated SEQ ID:4074.

[47991] Another function of VGAM1363 is therefore inhibition of LOC148529 (Accession XM_097481). Accordingly, utilities of VGAM1363 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148529. LOC148823 (Accession NM_145278) is another VGAM1363 host target gene. LOC148823 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148823, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148823 BINDING SITE, designated SEQ ID:29792, to the nucleotide sequence of VGAM1363 RNA, herein designated VGAM RNA, also designated SEQ ID:4074.

[47992] Another function of VGAM1363 is therefore inhibition of LOC148823 (Accession NM_145278). Accordingly, utilities of VGAM1363 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148823. LOC220963 (Accession XM_166145) is another VGAM1363 host target gene. LOC220963 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220963, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220963 BINDING SITE, designated SEQ ID:43955, to the nucleotide sequence of VGAM1363 RNA, herein designated VGAM RNA, also designated SEQ ID:4074.

[47993] Another function of VGAM1363 is therefore inhibition of LOC220963 (Accession XM_166145). Accordingly, utilities of VGAM1363 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220963. LOC221337 (Accession XM_166387) is another VGAM1363 host target gene. LOC221337 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221337, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221337 BINDING SITE, designated SEQ ID:44234, to the nucleotide sequence of VGAM1363 RNA, herein designated VGAM RNA, also designated SEQ ID:4074.

[47994] Another function of VGAM1363 is therefore inhibition of LOC221337 (Accession XM_166387). Accordingly, utilities of VGAM1363 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221337. LOC255671 (Accession XM_173196) is another VGAM1363 host target gene. LOC255671 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255671, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255671 BINDING SITE, designated SEQ ID:46438, to the nucleotide sequence of VGAM1363 RNA, herein designated VGAM RNA, also designated SEQ ID:4074.

[47995] Another function of VGAM1363 is therefore inhibition of LOC255671 (Accession XM_173196). Accordingly, utilities of VGAM1363 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC255671. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1364 (VGAM1364) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47996] VGAM1364 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1364 was detected is described hereinabove with reference to Figs. 1–8.

[47997] VGAM1364 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Duck Adenovirus 1. VGAM1364 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47998] VGAM1364 gene encodes a VGAM1364 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1364 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1364 precursor RNA is designated SEQ ID:1350, and is provided hereinbelow with ref–

erence to the sequence listing part. Nucleotide sequence SEQ ID:1350 is located at position 14767 relative to the genome of Duck Adenovirus 1.

- [47999] VGAM1364 precursor RNA folds onto itself, forming VGAM1364 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [48000] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1364 folded precursor RNA into VGAM1364 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1364 RNA is designated SEQ ID:4075, and is provided hereinbelow with reference to the sequence listing part.

[48001] VGAM1364 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1364 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1364 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[48002] VGAM1364 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1364 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1364 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1364 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM1364 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[48003] The complementary binding of VGAM1364 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1364 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1364 host target RNA into VGAM1364 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48004] It is appreciated that VGAM1364 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1364 host target genes. The mRNA of each one of this plurality of VGAM1364 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1364 RNA, herein designated VGAM RNA, and which when bound by VGAM1364 RNA causes

inhibition of translation of respective one or more VGAM1364 host target proteins.

[48005] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1364 gene, herein designated VGAM GENE, on one or more VGAM1364 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[48006] It is yet further appreciated that a function of VGAM1364 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1364 include diagnosis, prevention and

treatment of viral infection by Duck Adenovirus 1. Specific functions, and accordingly utilities, of VGAM1364 correlate with, and may be deduced from, the identity of the host target genes which VGAM1364 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48007] Nucleotide sequences of the VGAM1364 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1364 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1364 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1364 are further described hereinbelow with reference to Table 1.

[48008] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1364 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1364 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48009] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1364 gene, herein designated VGAM is inhibition of expression of VGAM1364 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM1364 correlate with, and may be deduced from, the identity of the target genes which VGAM1364 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[48010] Solute Carrier Family 25 (mitochondrial carrier; ornithine transporter) Member 15 (SLC25A15, Accession NM_014252) is a VGAM1364 host target gene. SLC25A15 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC25A15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC25A15 BINDING SITE, designated SEQ ID:15526, to the nucleotide sequence of VGAM1364 RNA, herein designated VGAM RNA, also designated SEQ ID:4075.

[48011] A function of VGAM1364 is therefore inhibition of Solute Carrier Family 25 (mitochondrial carrier; ornithine transporter) Member 15 (SLC25A15, Accession NM_014252), a gene which participates the ornithine transport across inner mitochondrial membrane, from the cytoplasm to the matrix. Accordingly, utilities of VGAM1364 include diag-

nosis, prevention and treatment of diseases and clinical conditions associated with SLC25A15. The function of SLC25A15 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM172.X-ray Repair Complementing Defective Repair In Chinese Hamster Cells 3 (XRCC3, Accession NM_005432) is another VGAM1364 host target gene. XRCC3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by XRCC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of XRCC3 BINDING SITE, designated SEQ ID:11906, to the nucleotide sequence of VGAM1364 RNA, herein designated VGAM RNA, also designated SEQ ID:4075.

[48012] Another function of VGAM1364 is therefore inhibition of X-ray Repair Complementing Defective Repair In Chinese Hamster Cells 3 (XRCC3, Accession NM_005432), a gene which is required for meiotic recombination, synaptonemal complex formation and cell cycle progression. Accordingly, utilities of VGAM1364 include diagnosis, pre-

vention and treatment of diseases and clinical conditions associated with XRCC3. The function of XRCC3 and its association with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM1290.FLJ00060 (Accession XM_028154) is another VGAM1364 host target gene.

FLJ00060 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ00060, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ00060 BINDING SITE, designated SEQ ID:30627, to the nucleotide sequence of VGAM1364 RNA, herein designated VGAM RNA, also designated SEQ ID:4075.

[48013] Another function of VGAM1364 is therefore inhibition of FLJ00060 (Accession XM_028154). Accordingly, utilities of VGAM1364 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00060. FLJ12969 (Accession NM_022838) is another VGAM1364 host target gene. FLJ12969 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ12969, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12969 BINDING SITE, designated SEQ ID:23124, to the nucleotide sequence of VGAM1364 RNA, herein designated VGAM RNA, also designated SEQ ID:4075.

[48014] Another function of VGAM1364 is therefore inhibition of FLJ12969 (Accession NM_022838). Accordingly, utilities of VGAM1364 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12969. FLJ13189 (Accession NM_024882) is another VGAM1364 host target gene. FLJ13189 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13189, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13189 BINDING SITE, designated SEQ ID:24328, to the nucleotide sequence of VGAM1364 RNA, herein designated VGAM RNA, also designated SEQ ID:4075.

[48015] Another function of VGAM1364 is therefore inhibition of FLJ13189 (Accession NM_024882). Accordingly, utilities of VGAM1364 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ13189. Forkhead Box P1 (FOXP1, Accession NM_032682) is another VGAM1364 host target gene. FOXP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FOXP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FOXP1 BINDING SITE, designated SEQ ID:26403, to the nucleotide sequence of VGAM1364 RNA, herein designated VGAM RNA, also designated SEQ ID:4075.

[48016] Another function of VGAM1364 is therefore inhibition of Forkhead Box P1 (FOXP1, Accession NM_032682). Accordingly, utilities of VGAM1364 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FOXP1. Mitochondrial Ribosomal Protein S27 (MRPS27, Accession NM_015084) is another VGAM1364 host target gene. MRPS27 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MRPS27, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of MRPS27 BINDING SITE, designated SEQ ID:17471, to the nucleotide sequence of VGAM1364 RNA, herein designated VGAM RNA, also designated SEQ ID:4075.

[48017] Another function of VGAM1364 is therefore inhibition of Mitochondrial Ribosomal Protein S27 (MRPS27, Accession NM_015084). Accordingly, utilities of VGAM1364 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPS27. LOC157773 (Accession XM_088387) is another VGAM1364 host target gene. LOC157773 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC157773, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157773 BINDING SITE, designated SEQ ID:39669, to the nucleotide sequence of VGAM1364 RNA, herein designated VGAM RNA, also designated SEQ ID:4075.

[48018] Another function of VGAM1364 is therefore inhibition of LOC157773 (Accession XM_088387). Accordingly, utilities of VGAM1364 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC157773. LOC162333 (Accession XM_102591) is another VGAM1364 host target gene. LOC162333 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC162333, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC162333 BINDING SITE, designated SEQ ID:42122, to the nucleotide sequence of VGAM1364 RNA, herein designated VGAM RNA, also designated SEQ ID:4075.

[48019] Another function of VGAM1364 is therefore inhibition of LOC162333 (Accession XM_102591). Accordingly, utilities of VGAM1364 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC162333. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1365 (VGAM1365) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48020] VGAM1365 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1365 was detected is described hereinabove with reference to Figs. 1–8.

[48021] VGAM1365 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Duck Adenovirus 1.

VGAM1365 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48022] VGAM1365 gene encodes a VGAM1365 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1365 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1365 precursor RNA is designated SEQ ID:1351, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1351 is located at position 10633 relative to the genome of Duck Adenovirus 1.

[48023] VGAM1365 precursor RNA folds onto itself, forming VGAM1365 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide

sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48024] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1365 folded precursor RNA into VGAM1365 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 93%) nucleotide sequence of VGAM1365 RNA is designated SEQ ID:4076, and is provided hereinbelow with reference to the sequence listing part.

[48025] VGAM1365 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1365 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1365 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[48026] VGAM1365 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1365 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1365 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1365 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1365 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[48027] The complementary binding of VGAM1365 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1365 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1365 host target RNA into VGAM1365 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48028] It is appreciated that VGAM1365 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1365 host target genes. The mRNA of each one of this plurality of VGAM1365 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1365 RNA, herein designated VGAM RNA, and which when bound by VGAM1365 RNA causes inhibition of translation of respective one or more VGAM1365 host target proteins.

[48029] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1365 gene, herein designated VGAM GENE, on one or more VGAM1365 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[48030] It is yet further appreciated that a function of VGAM1365 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1365 include diagnosis, prevention and treatment of viral infection by Duck Adenovirus 1. Specific functions, and accordingly utilities, of VGAM1365 correlate with, and may be deduced from, the identity of the host target genes which VGAM1365 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48031] Nucleotide sequences of the VGAM1365 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1365 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM1365 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1365 are further described hereinbelow with reference to Table 1.

[48032] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1365 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1365 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48033] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1365 gene, herein designated VGAM is inhibition of expression of VGAM1365 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1365 correlate with, and may be deduced from, the identity of the target genes which VGAM1365 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[48034] Discs, Large (Drosophila) Homolog 5 (DLG5, Accession XM_096398) is a VGAM1365 host target gene. DLG5 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DLG5, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DLG5 BINDING SITE, designated SEQ ID:40334, to the nucleotide sequence of VGAM1365 RNA, herein designated VGAM RNA, also designated SEQ ID:4076.

[48035] A function of VGAM1365 is therefore inhibition of Discs, Large (Drosophila) Homolog 5 (DLG5, Accession XM_096398), a gene which may transmit extracellular signals to inhibit cell proliferation. Accordingly, utilities of VGAM1365 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DLG5. The function of DLG5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM444. Mannose-binding Lectin (protein C) 2, Soluble (opsonic defect) (MBL2, Accession NM_000242) is another VGAM1365 host target gene. MBL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MBL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MBL2 BIND-

ING SITE, designated SEQ ID:5760, to the nucleotide sequence of VGAM1365 RNA, herein designated VGAM RNA, also designated SEQ ID:4076.

[48036] Another function of VGAM1365 is therefore inhibition of Mannose-binding Lectin (protein C) 2, Soluble (opsonic defect) (MBL2, Accession NM_000242). Accordingly, utilities of VGAM1365 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MBL2. DKFZp566H0824 (Accession NM_017535) is another VGAM1365 host target gene. DKFZp566H0824 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZp566H0824, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp566H0824 BINDING SITE, designated SEQ ID:18975, to the nucleotide sequence of VGAM1365 RNA, herein designated VGAM RNA, also designated SEQ ID:4076.

[48037] Another function of VGAM1365 is therefore inhibition of DKFZp566H0824 (Accession NM_017535). Accordingly, utilities of VGAM1365 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with DKFZp566H0824. DKFZP566J091 (Accession NM_030915) is another VGAM1365 host target gene. DKFZP566J091 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP566J091, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP566J091 BINDING SITE, designated SEQ ID:25185, to the nucleotide sequence of VGAM1365 RNA, herein designated VGAM RNA, also designated SEQ ID:4076.

[48038] Another function of VGAM1365 is therefore inhibition of DKFZP566J091 (Accession NM_030915). Accordingly, utilities of VGAM1365 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP566J091. FLJ10901 (Accession NM_018265) is another VGAM1365 host target gene. FLJ10901 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10901, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10901 BINDING SITE, designated SEQ ID:20228, to the

nucleotide sequence of VGAM1365 RNA, herein designated VGAM RNA, also designated SEQ ID:4076.

[48039] Another function of VGAM1365 is therefore inhibition of FLJ10901 (Accession NM_018265). Accordingly, utilities of VGAM1365 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10901. GW112 (Accession NM_006418) is another VGAM1365 host target gene. GW112 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GW112, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GW112 BINDING SITE, designated SEQ ID:13132, to the nucleotide sequence of VGAM1365 RNA, herein designated VGAM RNA, also designated SEQ ID:4076.

[48040] Another function of VGAM1365 is therefore inhibition of GW112 (Accession NM_006418). Accordingly, utilities of VGAM1365 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GW112. KIAA0993 (Accession XM_034413) is another VGAM1365 host target gene. KIAA0993 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by KIAA0993, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0993 BINDING SITE, designated SEQ ID:32080, to the nucleotide sequence of VGAM1365 RNA, herein designated VGAM RNA, also designated SEQ ID:4076.

[48041] Another function of VGAM1365 is therefore inhibition of KIAA0993 (Accession XM_034413). Accordingly, utilities of VGAM1365 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0993. KIAA1822 (Accession XM_041566) is another VGAM1365 host target gene. KIAA1822 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1822, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1822 BINDING SITE, designated SEQ ID:33550, to the nucleotide sequence of VGAM1365 RNA, herein designated VGAM RNA, also designated SEQ ID:4076.

[48042] Another function of VGAM1365 is therefore inhibition of KIAA1822 (Accession XM_041566). Accordingly, utilities

of VGAM1365 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1822. p21(CDKN1A)-activated Kinase 6 (PAK6, Accession NM_020168) is another VGAM1365 host target gene. PAK6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PAK6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAK6 BINDING SITE, designated SEQ ID:21388, to the nucleotide sequence of VGAM1365 RNA, herein designated VGAM RNA, also designated SEQ ID:4076.

[48043] Another function of VGAM1365 is therefore inhibition of p21(CDKN1A)-activated Kinase 6 (PAK6, Accession NM_020168). Accordingly, utilities of VGAM1365 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAK6. Tumor Necrosis Factor Receptor Superfamily, Member 21 (TNFRSF21, Accession NM_014452) is another VGAM1365 host target gene. TNFRSF21 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TNFRSF21, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of TNFRSF21 BINDING SITE, designated SEQ ID:15802, to the nucleotide sequence of VGAM1365 RNA, herein designated VGAM RNA, also designated SEQ ID:4076.

[48044] Another function of VGAM1365 is therefore inhibition of Tumor Necrosis Factor Receptor Superfamily, Member 21 (TNFRSF21, Accession NM_014452). Accordingly, utilities of VGAM1365 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFRSF21. LOC120892 (Accession XM_058513) is another VGAM1365 host target gene. LOC120892 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC120892, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC120892 BINDING SITE, designated SEQ ID:36648, to the nucleotide sequence of VGAM1365 RNA, herein designated VGAM RNA, also designated SEQ ID:4076.

[48045] Another function of VGAM1365 is therefore inhibition of LOC120892 (Accession XM_058513). Accordingly, utilities of VGAM1365 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC120892. LOC157653 (Accession XM_088353) is another VGAM1365 host target gene. LOC157653 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC157653, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157653 BINDING SITE, designated SEQ ID:39633, to the nucleotide sequence of VGAM1365 RNA, herein designated VGAM RNA, also designated SEQ ID:4076.

[48046] Another function of VGAM1365 is therefore inhibition of LOC157653 (Accession XM_088353). Accordingly, utilities of VGAM1365 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157653. LOC245771 (Accession XM_167366) is another VGAM1365 host target gene. LOC245771 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC245771, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC245771 BINDING SITE, designated SEQ ID:44633, to

the nucleotide sequence of VGAM1365 RNA, herein designated VGAM RNA, also designated SEQ ID:4076.

[48047] Another function of VGAM1365 is therefore inhibition of LOC245771 (Accession XM_167366). Accordingly, utilities of VGAM1365 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC245771. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1366 (VGAM1366) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48048] VGAM1366 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1366 was detected is described hereinabove with reference to Figs. 1–8.

[48049] VGAM1366 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 6. VGAM1366 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48050] VGAM1366 gene encodes a VGAM1366 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1366 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1366 precursor RNA is designated SEQ ID:1352, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1352 is located at position 50024 relative to the genome of Human Herpesvirus 6.

[48051] VGAM1366 precursor RNA folds onto itself, forming VGAM1366 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48052] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1366 folded precursor RNA into VGAM1366 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1366 RNA is designated SEQ ID:4077, and is provided hereinbelow with reference to the sequence listing part.

[48053] VGAM1366 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1366 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1366 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[48054] VGAM1366 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1366 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1366 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1366 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1366 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[48055] The complementary binding of VGAM1366 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1366 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1366 host target RNA into VGAM1366 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48056] It is appreciated that VGAM1366 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1366 host target genes. The mRNA of each one of this plurality of VGAM1366 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1366 RNA, herein designated VGAM RNA, and which when bound by VGAM1366 RNA causes inhibition of translation of respective one or more VGAM1366 host target proteins.

[48057] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1366 gene, herein designated VGAM GENE, on one or more VGAM1366 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[48058] It is yet further appreciated that a function of VGAM1366 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1366 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 6. Specific functions, and accordingly utilities, of VGAM1366 correlate with, and may be deduced from, the identity of the host target genes which VGAM1366 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48059] Nucleotide sequences of the VGAM1366 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1366 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1366 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1366 are further described hereinbelow with reference to Table 1.

[48060] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1366 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM1366 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48061] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1366 gene, herein designated VGAM is inhibition of expression of VGAM1366 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1366 correlate with, and may be deduced from, the identity of the target genes which VGAM1366 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[48062] V-erb-b2 Erythroblastic Leukemia Viral Oncogene Homolog 2, Neuro/glioblastoma Derived Oncogene Homolog (avian) (ERBB2, Accession NM_004448) is a VGAM1366 host target gene. ERBB2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ERBB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ERBB2 BINDING SITE, designated SEQ ID:10745, to the nucleotide sequence of VGAM1366 RNA, herein designated VGAM RNA, also designated SEQ ID:4077.

[48063] A function of VGAM1366 is therefore inhibition of V-erb-b2 Erythroblastic Leukemia Viral Oncogene Homolog 2, Neuro/glioblastoma Derived Oncogene Homolog (avian) (ERBB2, Accession NM_004448), a gene which Tyrosine kinase receptor. Accordingly, utilities of VGAM1366 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ERBB2. The function of ERBB2 has been established by previous studies. The oncogene originally called NEU was derived from rat neuro/glioblastoma cell lines. It encodes a tumor antigen, p185, which is serologically related to EGFR, the epidermal growth factor receptor (OMIM Ref. No. 131550). EGFR maps to chromosome 7. Yang-Feng et al. (1985) found, however, that the human homolog, which they designated NGL (to avoid confusion with neuraminidase, which is also symbolized NEU), maps to 17q12-q22 by in situ hybridization and to 17q21-qter in somatic cell hybrids. Thus, the SRO is 17q21-q22. Coussens et al. (1985) identified a potential cell surface receptor of the tyrosine kinase gene family and characterized it by cloning the gene. Its primary sequence is very similar to that of the human epidermal growth factor receptor. Because of the seemingly close relationship to the human EGF receptor, the

authors called the gene HER2. By Southern blot analysis of somatic cell hybrid DNA and by in situ hybridization, the gene was assigned to 17q21–q22. This chromosomal location of the gene is coincident with the NEU oncogene, which suggests that the 2 genes may in fact be the same; indeed, sequencing indicates that they are identical (Francke, 1988). Van de Vijver et al. (1988) found a correlation between overexpression of NEU protein and the large-cell, comedo growth type of ductal carcinoma. They could find no correlation, however, with lymph-node status or tumor recurrence. Slamon et al. (1989) described the role of HER2/NEU in breast (OMIM Ref. No. 114480) and ovarian cancer (OMIM Ref. No. 167000), which together account for one-third of all cancers in women and approximately one-quarter of cancer-related deaths in females. The HER2 gene is amplified and HER2 is overexpressed in 25 to 30% of breast cancers, increasing the aggressiveness of the tumor. Slamon et al. (2001) found that herceptin increased the clinical benefit of first-line chemotherapy in metastatic breast cancer that overexpresses HER2. In a population-based case control study of the val655-to-ile polymorphism (164870.0001), Xie et al. (2000) found that the val allele was associated with an in-

creased risk of breast cancer, particularly among younger women. Because of the significant ethnic differences in the incidence of breast cancer and other solid tumors, Ameyaw et al. (2002) undertook a study of 7 ethnic groups from 3 separate continents. The frequency of the val allele was highly variable between populations (1 to 24%). The continental African populations had a lower frequency than did the other subjects, corresponding with the lower incidence and lower risk of breast cancer in African women compared with Caucasian and African-American women. Animal model experiments lend further support to the function of ERBB2. An activated mutant form of ERBB2 is rarely found in human cancer. Instead, wildtype ERBB2 is overexpressed and/or amplified in 10 to 30% of breast cancers, where it correlates with chemoresistance and poor patient prognosis. Herceptin, a monoclonal antibody against ERBB2, is an effective treatment for a subset of patients with advanced breast cancer. Liu et al. (2002) used a transgenic mouse model with targeted aberrant overexpression of ERBB2 to determine whether genetic instability is associated with mammary tumorigenesis in vivo in the absence of heritable defects in known DNA maintenance genes.

[48064] It is appreciated that the abovementioned animal model for ERBB2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[48065] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[48068] Further studies establishing the function and utilities of ERBB2 are found in John Hopkins OMIM database record ID 164870, and in sited publications numbered 1826-1827, 11591-2086, 11999-2102, 274 and 3136-3140 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Forkhead

Box D2 (FOXD2, Accession NM_004474) is another VGAM1366 host target gene. FOXD2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FOXD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FOXD2 BINDING SITE, designated SEQ ID:10787, to the nucleotide sequence of VGAM1366 RNA, herein designated VGAM RNA, also designated SEQ ID:4077.

[48069] Another function of VGAM1366 is therefore inhibition of Forkhead Box D2 (FOXD2, Accession NM_004474). Accordingly, utilities of VGAM1366 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FOXD2. Acetyl-Coenzyme A Acyltransferase 2 (mitochondrial 3-oxoacyl-Coenzyme A thiolase) (ACAA2, Accession XM_166287) is another VGAM1366 host target gene. ACAA2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ACAA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACAA2 BINDING SITE, des-

ignated SEQ ID:44096, to the nucleotide sequence of VGAM1366 RNA, herein designated VGAM RNA, also designated SEQ ID:4077.

[48070] Another function of VGAM1366 is therefore inhibition of Acetyl-Coenzyme A Acyltransferase 2 (mitochondrial 3-oxoacyl-Coenzyme A thiolase) (ACAA2, Accession XM_166287). Accordingly, utilities of VGAM1366 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACAA2. Conserved Helix-loop-helix Ubiquitous Kinase (CHUK, Accession NM_001278) is another VGAM1366 host target gene. CHUK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CHUK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHUK BINDING SITE, designated SEQ ID:6947, to the nucleotide sequence of VGAM1366 RNA, herein designated VGAM RNA, also designated SEQ ID:4077.

[48071] Another function of VGAM1366 is therefore inhibition of Conserved Helix-loop-helix Ubiquitous Kinase (CHUK, Accession NM_001278). Accordingly, utilities of VGAM1366 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with CHUK. DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 28 (DDX28, Accession NM_018380) is another VGAM1366 host target gene. DDX28 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DDX28, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDX28 BINDING SITE, designated SEQ ID:20409, to the nucleotide sequence of VGAM1366 RNA, herein designated VGAM RNA, also designated SEQ ID:4077.

[48072] Another function of VGAM1366 is therefore inhibition of DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 28 (DDX28, Accession NM_018380). Accordingly, utilities of VGAM1366 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDX28. DIS3 (Accession NM_014953) is another VGAM1366 host target gene. DIS3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DIS3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of DIS3 BINDING SITE, designated SEQ ID:17303, to the nucleotide sequence of VGAM1366 RNA, herein designated VGAM RNA, also designated SEQ ID:4077.

[48073] Another function of VGAM1366 is therefore inhibition of DIS3 (Accession NM_014953). Accordingly, utilities of VGAM1366 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DIS3. DJ328E19.C1.1 (Accession NM_015383) is another VGAM1366 host target gene. DJ328E19.C1.1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DJ328E19.C1.1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DJ328E19.C1.1 BINDING SITE, designated SEQ ID:17683, to the nucleotide sequence of VGAM1366 RNA, herein designated VGAM RNA, also designated SEQ ID:4077.

[48074] Another function of VGAM1366 is therefore inhibition of DJ328E19.C1.1 (Accession NM_015383). Accordingly, utilities of VGAM1366 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DJ328E19.C1.1. FLJ21032 (Accession NM_024906) is

another VGAM1366 host target gene. FLJ21032 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21032, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21032 BINDING SITE, designated SEQ ID:24398, to the nucleotide sequence of VGAM1366 RNA, herein designated VGAM RNA, also designated SEQ ID:4077.

[48075] Another function of VGAM1366 is therefore inhibition of FLJ21032 (Accession NM_024906). Accordingly, utilities of VGAM1366 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21032. FLJ21817 (Accession NM_022448) is another VGAM1366 host target gene. FLJ21817 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21817, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21817 BINDING SITE, designated SEQ ID:22783, to the nucleotide sequence of VGAM1366 RNA, herein designated VGAM RNA, also designated SEQ ID:4077.

[48076] Another function of VGAM1366 is therefore inhibition of FLJ21817 (Accession NM_022448). Accordingly, utilities of VGAM1366 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21817. G-protein Coupled Receptor 88 (GPR88, Accession NM_022049) is another VGAM1366 host target gene. GPR88 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GPR88, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPR88 BINDING SITE, designated SEQ ID:22573, to the nucleotide sequence of VGAM1366 RNA, herein designated VGAM RNA, also designated SEQ ID:4077.

[48077] Another function of VGAM1366 is therefore inhibition of G-protein Coupled Receptor 88 (GPR88, Accession NM_022049). Accordingly, utilities of VGAM1366 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR88. G Protein Pathway Suppressor 2 (GPS2, Accession NM_004489) is another VGAM1366 host target gene. GPS2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region

of mRNA encoded by GPS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPS2 BINDING SITE, designated SEQ ID:10825, to the nucleotide sequence of VGAM1366 RNA, herein designated VGAM RNA, also designated SEQ ID:4077.

[48078] Another function of VGAM1366 is therefore inhibition of G Protein Pathway Suppressor 2 (GPS2, Accession NM_004489). Accordingly, utilities of VGAM1366 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPS2. KIAA0295 (Accession XM_042833) is another VGAM1366 host target gene. KIAA0295 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0295, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0295 BINDING SITE, designated SEQ ID:33786, to the nucleotide sequence of VGAM1366 RNA, herein designated VGAM RNA, also designated SEQ ID:4077.

[48079] Another function of VGAM1366 is therefore inhibition of

KIAA0295 (Accession XM_042833). Accordingly, utilities of VGAM1366 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0295. KIAA0561 (Accession XM_038150) is another VGAM1366 host target gene. KIAA0561 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0561, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0561 BINDING SITE, designated SEQ ID:32766, to the nucleotide sequence of VGAM1366 RNA, herein designated VGAM RNA, also designated SEQ ID:4077.

[48080] Another function of VGAM1366 is therefore inhibition of KIAA0561 (Accession XM_038150). Accordingly, utilities of VGAM1366 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0561. KIAA1826 (Accession XM_040784) is another VGAM1366 host target gene. KIAA1826 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1826, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1826 BINDING SITE, designated SEQ ID:33378, to the nucleotide sequence of VGAM1366 RNA, herein designated VGAM RNA, also designated SEQ ID:4077.

[48081] Another function of VGAM1366 is therefore inhibition of KIAA1826 (Accession XM_040784). Accordingly, utilities of VGAM1366 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1826. MGC3184 (Accession NM_030965) is another VGAM1366 host target gene. MGC3184 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC3184, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC3184 BINDING SITE, designated SEQ ID:25232, to the nucleotide sequence of VGAM1366 RNA, herein designated VGAM RNA, also designated SEQ ID:4077.

[48082] Another function of VGAM1366 is therefore inhibition of MGC3184 (Accession NM_030965). Accordingly, utilities of VGAM1366 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC3184. MGC5139 (Accession XM_058587) is another

VGAM1366 host target gene. MGC5139 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC5139, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC5139 BINDING SITE, designated SEQ ID:36679, to the nucleotide sequence of VGAM1366 RNA, herein designated VGAM RNA, also designated SEQ ID:4077.

[48083] Another function of VGAM1366 is therefore inhibition of MGC5139 (Accession XM_058587). Accordingly, utilities of VGAM1366 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC5139. Neurexophilin 3 (NXPH3, Accession XM_037847) is another VGAM1366 host target gene. NXPH3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NXPH3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NXPH3 BINDING SITE, designated SEQ ID:32720, to the nucleotide sequence of VGAM1366 RNA, herein designated VGAM RNA, also designated SEQ

ID:4077.

[48084] Another function of VGAM1366 is therefore inhibition of Neurexophilin 3 (NXPH3, Accession XM_037847). Accordingly, utilities of VGAM1366 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NXPH3. P11 (Accession NM_006025) is another VGAM1366 host target gene. P11 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by P11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P11 BINDING SITE, designated SEQ ID:12642, to the nucleotide sequence of VGAM1366 RNA, herein designated VGAM RNA, also designated SEQ ID:4077.

[48085] Another function of VGAM1366 is therefore inhibition of P11 (Accession NM_006025). Accordingly, utilities of VGAM1366 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P11. LOC127262 (Accession XM_072073) is another VGAM1366 host target gene. LOC127262 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC127262, corresponding

to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC127262 BINDING SITE, designated SEQ ID:37459, to the nucleotide sequence of VGAM1366 RNA, herein designated VGAM RNA, also designated SEQ ID:4077.

[48086] Another function of VGAM1366 is therefore inhibition of LOC127262 (Accession XM_072073). Accordingly, utilities of VGAM1366 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC127262. LOC149013 (Accession XM_086398) is another VGAM1366 host target gene. LOC149013 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149013, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149013 BINDING SITE, designated SEQ ID:38633, to the nucleotide sequence of VGAM1366 RNA, herein designated VGAM RNA, also designated SEQ ID:4077.

[48087] Another function of VGAM1366 is therefore inhibition of LOC149013 (Accession XM_086398). Accordingly, utilities of VGAM1366 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC149013. LOC149317 (Accession XM_086493) is another VGAM1366 host target gene. LOC149317 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149317, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149317 BINDING SITE, designated SEQ ID:38709, to the nucleotide sequence of VGAM1366 RNA, herein designated VGAM RNA, also designated SEQ ID:4077.

[48088] Another function of VGAM1366 is therefore inhibition of LOC149317 (Accession XM_086493). Accordingly, utilities of VGAM1366 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149317. LOC220638 (Accession XM_058247) is another VGAM1366 host target gene. LOC220638 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC220638, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220638 BINDING SITE, designated SEQ ID:36589, to

the nucleotide sequence of VGAM1366 RNA, herein designated VGAM RNA, also designated SEQ ID:4077.

[48089] Another function of VGAM1366 is therefore inhibition of LOC220638 (Accession XM_058247). Accordingly, utilities of VGAM1366 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220638. LOC221975 (Accession XM_166534) is another VGAM1366 host target gene. LOC221975 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221975, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221975 BINDING SITE, designated SEQ ID:44496, to the nucleotide sequence of VGAM1366 RNA, herein designated VGAM RNA, also designated SEQ ID:4077.

[48090] Another function of VGAM1366 is therefore inhibition of LOC221975 (Accession XM_166534). Accordingly, utilities of VGAM1366 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221975. LOC257031 (Accession XM_170583) is another VGAM1366 host target gene. LOC257031 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC257031, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257031 BINDING SITE, designated SEQ ID:45390, to the nucleotide sequence of VGAM1366 RNA, herein designated VGAM RNA, also designated SEQ ID:4077.

[48091] Another function of VGAM1366 is therefore inhibition of LOC257031 (Accession XM_170583). Accordingly, utilities of VGAM1366 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257031. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1367 (VGAM1367) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48092] VGAM1367 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1367 was detected is described hereinabove with reference to Figs. 1-8.

[48093] VGAM1367 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Human Herpesvirus 6. VGAM1367 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48094] VGAM1367 gene encodes a VGAM1367 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1367 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1367 precursor RNA is designated SEQ ID:1353, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1353 is located at position 48800 relative to the genome of Human Herpesvirus 6.

[48095] VGAM1367 precursor RNA folds onto itself, forming VGAM1367 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48096] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1367 folded precursor RNA into VGAM1367 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of VGAM1367 RNA is designated SEQ ID:4078, and is provided hereinbelow with reference to the sequence listing part.

[48097] VGAM1367 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1367 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1367 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[48098] VGAM1367 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1367 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1367 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1367 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1367 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[48099] The complementary binding of VGAM1367 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1367 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1367

host target RNA into VGAM1367 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48100] It is appreciated that VGAM1367 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1367 host target genes. The mRNA of each one of this plurality of VGAM1367 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1367 RNA, herein designated VGAM RNA, and which when bound by VGAM1367 RNA causes inhibition of translation of respective one or more VGAM1367 host target proteins.

[48101] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1367 gene, herein designated VGAM GENE, on one or more VGAM1367 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[48102] It is yet further appreciated that a function of VGAM1367 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1367 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 6. Specific functions, and accordingly utilities, of VGAM1367 correlate with, and may be deduced from, the identity of the host target genes which VGAM1367 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48103] Nucleotide sequences of the VGAM1367 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1367 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1367 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1367 are further

described hereinbelow with reference to Table 1.

[48104] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1367 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1367 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48105] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1367 gene, herein designated VGAM is inhibition of expression of VGAM1367 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1367 correlate with, and may be deduced from, the identity of the target genes which VGAM1367 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[48106] Branched Chain Aminotransferase 1, Cytosolic (BCAT1, Accession XM_038659) is a VGAM1367 host target gene. BCAT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BCAT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of BCAT1 BINDING SITE, designated SEQ ID:32896, to the nucleotide sequence of VGAM1367 RNA, herein designated VGAM RNA, also designated SEQ ID:4078.

[48107] A function of VGAM1367 is therefore inhibition of Branched Chain Aminotransferase 1, Cytosolic (BCAT1, Accession XM_038659), a gene which catalyzes of the essential branched chain leucine, isoleucine, and valine. Accordingly, utilities of VGAM1367 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCAT1. The function of BCAT1 has been established by previous studies. Jones and Moore (1976) isolated an auxotrophic mutant in Chinese-hamster ovary cells that lacks the ability to grow if alpha-ketoisovaleric acid, alpha-ketoisocaproic acid and alpha-keto-beta-methylvaleric acid are substituted for valine, leucine and isoleucine in the culture medium. This auxotroph, called TRANS-minus, is caused by lack of the enzyme branched-chain amino acid transaminase (BCT). Jones and Moore (1979) provisionally assigned the BCT1 gene to 12pter-q12. Naylor and Shows (1979, 1980) also assigned BCT1 to chromosome 12 and BCT2 (OMIM Ref. No. 113530) to chromosome 19. There may be 2 different

clinical disorders due to defect of branched-chain amino acid transamination, hypervalinemia (OMIM Ref. No. 277100) and hyperleucine-isoleucinemia (OMIM Ref. No. 238340). Since there are 2 distinct BCATs (see OMIM Ref. No. 113530), it is possible that one is mutant in each of these 2 conditions. Animal model experiments lend further support to the function of BCAT1. In the mouse, Benvenisty et al. (1992) isolated the Bcat1 gene by a subtraction/coexpression strategy with Myc-induced tumors of transgenic mice, and proved that Bcat1 is a direct genetic target for Myc regulation in the mouse. The Bcat1 gene is highly expressed early in embryogenesis, and during organogenesis its expression is localized to the neural tube, the somites, and the mesonephric tubules. The gene is also expressed in several MYC-based tumors. Schuldiner et al. (1996) isolated and compared the structural sequences of the Bcat1 homolog in mice, human, nematode, and yeast and showed that in human, as in mouse, the BCAT1 gene is a target for MYC activity in the oncogenesis process.

[48108] It is appreciated that the abovementioned animal model for BCAT1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appre-

ciated from the publications sited hereinbelow.

[48109] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[48110] Jones, C.; Moore, E. E. : Isolation of mutants lacking branched-chain amino acid transaminase. *Somat. Cell Genet.* 2: 235–243, 1976. ; and

[48111] Schuldiner, O.; Eden, A.; Ben-Yosef, T.; Yanuka, O.; Simchen, G.; Benvenisty, N. : ECA39, a conserved gene regulated by c-Myc in mice, is involved in G1/S cell cycle regulation in yeast.

[48112] Further studies establishing the function and utilities of BCAT1 are found in John Hopkins OMIM database record ID 113520, and in sited publications numbered 4194–4203 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. TIRAP (Accession NM_052887) is another VGAM1367 host target gene. TIRAP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TIRAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIRAP BINDING SITE, designated SEQ ID:27475,

to the nucleotide sequence of VGAM1367 RNA, herein designated VGAM RNA, also designated SEQ ID:4078.

[48113] Another function of VGAM1367 is therefore inhibition of TIRAP (Accession NM_052887), a gene which is a adapter involved in the TLR4 signaling pathway in the innate immune response. Accordingly, utilities of VGAM1367 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIRAP. The function of TIRAP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM189. BCL2-like 12 (proline rich) (BCL2L12, Accession NM_138639) is another VGAM1367 host target gene. BCL2L12 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by BCL2L12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL2L12 BINDING SITE, designated SEQ ID:28914, to the nucleotide sequence of VGAM1367 RNA, herein designated VGAM RNA, also designated SEQ ID:4078.

[48114] Another function of VGAM1367 is therefore inhibition of

BCL2-like 12 (proline rich) (BCL2L12, Accession NM_138639). Accordingly, utilities of VGAM1367 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL2L12. KIAA1798 (Accession XM_027074) is another VGAM1367 host target gene. KIAA1798 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1798, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1798 BINDING SITE, designated SEQ ID:30402, to the nucleotide sequence of VGAM1367 RNA, herein designated VGAM RNA, also designated SEQ ID:4078.

[48115] Another function of VGAM1367 is therefore inhibition of KIAA1798 (Accession XM_027074). Accordingly, utilities of VGAM1367 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1798. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1368 (VGAM1368) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[48116] VGAM1368 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1368 was detected is described hereinabove with reference to Figs. 1–8.

[48117] VGAM1368 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 6. VGAM1368 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48118] VGAM1368 gene encodes a VGAM1368 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1368 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1368 precursor RNA is designated SEQ ID:1354, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1354 is located at position 44241 relative to the genome of Human Herpesvirus 6.

[48119] VGAM1368 precursor RNA folds onto itself, forming VGAM1368 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48120] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1368 folded precursor RNA into VGAM1368 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM1368 RNA is designated SEQ ID:4079, and is provided hereinbelow with reference to the sequence listing part.

[48121] VGAM1368 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1368 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1368 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[48122] VGAM1368 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1368 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1368 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1368 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1368 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[48123] The complementary binding of VGAM1368 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1368 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1368 host target RNA into VGAM1368 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48124] It is appreciated that VGAM1368 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1368 host target genes. The mRNA of each one of this plurality of VGAM1368 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1368 RNA, herein designated VGAM RNA, and which when bound by VGAM1368 RNA causes inhibition of translation of respective one or more VGAM1368 host target proteins.

[48125] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1368 gene, herein designated VGAM GENE, on one or more VGAM1368 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[48126] It is yet further appreciated that a function of VGAM1368 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1368 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 6. Specific functions, and accordingly utilities, of VGAM1368 correlate with, and may be deduced from, the identity of the host target genes which VGAM1368 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[48127] Nucleotide sequences of the VGAM1368 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1368 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1368 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1368 are further described hereinbelow with reference to Table 1.

[48128] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1368 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1368 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48129] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1368 gene, herein designated VGAM is inhibition of expression of VGAM1368 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1368 correlate with, and may be deduced from, the identity of the target genes which VGAM1368 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[48130] Matrix Metalloproteinase 19 (MMP19, Accession NM_002429) is a VGAM1368 host target gene. MMP19 BINDING SITE1 and MMP19 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MMP19, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MMP19 BINDING SITE1 and MMP19 BINDING SITE2, designated SEQ ID:8266 and SEQ ID:23071 respectively, to the nucleotide sequence of VGAM1368 RNA, herein designated VGAM RNA, also designated SEQ ID:4079.

[48131] A function of VGAM1368 is therefore inhibition of Matrix Metalloproteinase 19 (MMP19, Accession NM_002429). Accordingly, utilities of VGAM1368 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MMP19. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1369 (VGAM1369) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48132] VGAM1369 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1369 was detected is described hereinabove with reference to Figs. 1–8.

[48133] VGAM1369 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 6. VGAM1369 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48134] VGAM1369 gene encodes a VGAM1369 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1369 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1369 precursor RNA is designated SEQ ID:1355, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1355 is located at position 50681 relative to the genome of Human Herpesvirus 6.

[48135] VGAM1369 precursor RNA folds onto itself, forming VGAM1369 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48136] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1369 folded precursor RNA into VGAM1369 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide sequence of VGAM1369 RNA is designated SEQ ID:4080, and is provided hereinbelow with reference to the sequence listing part.

[48137] VGAM1369 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1369 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1369 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[48138] VGAM1369 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1369 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1369 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1369 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1369 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[48139] The complementary binding of VGAM1369 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1369 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1369 host target RNA into VGAM1369 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48140] It is appreciated that VGAM1369 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1369 host target genes. The mRNA of each one of this plurality of VGAM1369 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1369 RNA, herein designated VGAM RNA, and which when bound by VGAM1369 RNA causes inhibition of translation of respective one or more VGAM1369 host target proteins.

[48141] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1369 gene, herein designated VGAM GENE, on one or more VGAM1369 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[48142] It is yet further appreciated that a function of VGAM1369 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1369 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 6. Specific functions, and accordingly utilities, of VGAM1369 correlate with, and may be deduced from, the identity of the host target genes which VGAM1369 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48143] Nucleotide sequences of the VGAM1369 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the
`diced` VGAM1369 RNA, herein designated VGAM RNA,
and a schematic representation of the secondary folding
of VGAM1369 folded precursor RNA, herein designated
VGAM FOLDED PRECURSOR RNA, of VGAM1369 are further
described hereinbelow with reference to Table 1.

[48144] Nucleotide sequences of host target binding sites, such as
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of
Fig. 1, found on VGAM1369 host target RNA, and
schematic representation of the complementarity of each
of these host target binding sites to VGAM1369 RNA,
herein designated VGAM RNA, are described hereinbelow
with reference to Table 2.

[48145] As mentioned hereinabove with reference to Fig. 1, a
function of VGAM1369 gene, herein designated VGAM is
inhibition of expression of VGAM1369 target genes. It is
appreciated that specific functions, and accordingly utili-
ties, of VGAM1369 correlate with, and may be deduced
from, the identity of the target genes which VGAM1369
binds and inhibits, and the function of these target genes,
as elaborated hereinbelow.

[48146] ATP10C (Accession NM_024490) is a VGAM1369 host tar-
get gene. ATP10C BINDING SITE is HOST TARGET binding

site found in the 3' untranslated region of mRNA encoded by ATP10C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP10C BINDING SITE, designated SEQ ID:23689, to the nucleotide sequence of VGAM1369 RNA, herein designated VGAM RNA, also designated SEQ ID:4080.

[48147] A function of VGAM1369 is therefore inhibition of ATP10C (Accession NM_024490), a gene which is phosphorylated in their intermediate state, drives uphill transport of ions across membranes. Accordingly, utilities of VGAM1369 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP10C. The function of ATP10C and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM801. Protein Tyrosine Phosphatase, Receptor Type, F (PTPRF, Accession NM_130440) is another VGAM1369 host target gene. PTPRF BINDING SITE1 and PTPRF BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PTPRF, corresponding to HOST TARGET binding sites such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPRF BINDING SITE1 and PTPRF BINDING SITE2, designated SEQ ID:28199 and SEQ ID:8725 respectively, to the nucleotide sequence of VGAM1369 RNA, herein designated VGAM RNA, also designated SEQ ID:4080.

[48148] Another function of VGAM1369 is therefore inhibition of Protein Tyrosine Phosphatase, Receptor Type, F (PTPRF, Accession NM_130440), a gene which negatively regulates the insulin signaling pathway. Accordingly, utilities of VGAM1369 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPRF. The function of PTPRF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1105. Cyclin M3 (CNNM3, Accession NM_017623) is another VGAM1369 host target gene. CNNM3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CNNM3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNNM3 BINDING SITE, designated SEQ ID:19125, to the

nucleotide sequence of VGAM1369 RNA, herein designated VGAM RNA, also designated SEQ ID:4080.

[48149] Another function of VGAM1369 is therefore inhibition of Cyclin M3 (CNNM3, Accession NM_017623). Accordingly, utilities of VGAM1369 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNNM3. KIAA1786 (Accession XM_038436) is another VGAM1369 host target gene. KIAA1786 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1786, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1786 BINDING SITE, designated SEQ ID:32847, to the nucleotide sequence of VGAM1369 RNA, herein designated VGAM RNA, also designated SEQ ID:4080.

[48150] Another function of VGAM1369 is therefore inhibition of KIAA1786 (Accession XM_038436). Accordingly, utilities of VGAM1369 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1786. NY-REN-41 (Accession NM_080654) is another VGAM1369 host target gene. NY-REN-41 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by NY-REN-41, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NY-REN-41 BINDING SITE, designated SEQ ID:27943, to the nucleotide sequence of VGAM1369 RNA, herein designated VGAM RNA, also designated SEQ ID:4080.

[48151] Another function of VGAM1369 is therefore inhibition of NY-REN-41 (Accession NM_080654). Accordingly, utilities of VGAM1369 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NY-REN-41. Paralemmin (PALM, Accession NM_002579) is another VGAM1369 host target gene. PALM BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PALM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PALM BINDING SITE, designated SEQ ID:8440, to the nucleotide sequence of VGAM1369 RNA, herein designated VGAM RNA, also designated SEQ ID:4080.

[48152] Another function of VGAM1369 is therefore inhibition of Paralemmin (PALM, Accession NM_002579). Accordingly,

utilities of VGAM1369 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PALM. PC2 (positive cofactor 2, multiprotein complex) Glutamine/Q-rich-associated Protein (PCQAP, Accession NM_015889) is another VGAM1369 host target gene. PCQAP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCQAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCQAP BINDING SITE, designated SEQ ID:18034, to the nucleotide sequence of VGAM1369 RNA, herein designated VGAM RNA, also designated SEQ ID:4080.

[48153] Another function of VGAM1369 is therefore inhibition of PC2 (positive cofactor 2, multiprotein complex) Glutamine/Q-rich-associated Protein (PCQAP, Accession NM_015889). Accordingly, utilities of VGAM1369 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCQAP. LOC57019 (Accession NM_020313) is another VGAM1369 host target gene. LOC57019 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded

by LOC57019, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC57019 BINDING SITE, designated SEQ ID:21569, to the nucleotide sequence of VGAM1369 RNA, herein designated VGAM RNA, also designated SEQ ID:4080.

[48154] Another function of VGAM1369 is therefore inhibition of LOC57019 (Accession NM_020313). Accordingly, utilities of VGAM1369 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC57019. LOC90485 (Accession XM_032059) is another VGAM1369 host target gene. LOC90485 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90485, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90485 BINDING SITE, designated SEQ ID:31553, to the nucleotide sequence of VGAM1369 RNA, herein designated VGAM RNA, also designated SEQ ID:4080.

[48155] Another function of VGAM1369 is therefore inhibition of LOC90485 (Accession XM_032059). Accordingly, utilities

of VGAM1369 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90485. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1370 (VGAM1370) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48156] VGAM1370 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1370 was detected is described hereinabove with reference to Figs. 1–8.

[48157] VGAM1370 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 6. VGAM1370 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48158] VGAM1370 gene encodes a VGAM1370 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1370 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM1370 precursor RNA is designated SEQ ID:1356, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1356 is located at position 50239 relative to the genome of Human Herpesvirus 6.

- [48159] VGAM1370 precursor RNA folds onto itself, forming VGAM1370 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [48160] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1370 folded precursor RNA into VGAM1370 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1370 RNA is designated SEQ ID:4081, and

is provided hereinbelow with reference to the sequence listing part.

[48161] VGAM1370 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1370 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1370 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[48162] VGAM1370 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1370 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1370 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM1370 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1370 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[48163] The complementary binding of VGAM1370 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1370 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1370 host target RNA into VGAM1370 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48164] It is appreciated that VGAM1370 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1370 host target genes. The mRNA of each one of this plurality of VGAM1370 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM1370 RNA, herein designated VGAM RNA, and which when bound by VGAM1370 RNA causes inhibition of translation of respective one or more VGAM1370 host target proteins.

[48165] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1370 gene, herein designated VGAM GENE, on one or more VGAM1370 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[48166] It is yet further appreciated that a function of VGAM1370 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1370 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 6. Specific functions, and accordingly utilities, of VGAM1370 correlate with, and may be deduced from, the identity of the host target genes which VGAM1370 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48167] Nucleotide sequences of the VGAM1370 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1370 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1370 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1370 are further described hereinbelow with reference to Table 1.

[48168] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1370 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1370 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48169] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM1370 gene, herein designated VGAM is inhibition of expression of VGAM1370 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1370 correlate with, and may be deduced from, the identity of the target genes which VGAM1370 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[48170] Membrane Component, Chromosome 17, Surface Marker 2 (ovarian carcinoma antigen CA125) (M17S2, Accession NM_031858) is a VGAM1370 host target gene. M17S2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by M17S2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of M17S2 BINDING SITE, designated SEQ ID:25608, to the nucleotide sequence of VGAM1370 RNA, herein designated VGAM RNA, also designated SEQ ID:4081.

[48171] A function of VGAM1370 is therefore inhibition of Membrane Component, Chromosome 17, Surface Marker 2 (ovarian carcinoma antigen CA125) (M17S2, Accession NM_031858), a gene which Contains a B-box/coiled coil motif. Accordingly, utilities of VGAM1370 include diagno-

sis, prevention and treatment of diseases and clinical conditions associated with M17S2. The function of M17S2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1081. Phosphoinositide-3-kinase, Regulatory Subunit, Polypeptide 3 (p55, gamma) (PIK3R3, Accession XM_027982) is another VGAM1370 host target gene. PIK3R3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PIK3R3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIK3R3 BINDING SITE, designated SEQ ID:30603, to the nucleotide sequence of VGAM1370 RNA, herein designated VGAM RNA, also designated SEQ ID:4081.

[48172] Another function of VGAM1370 is therefore inhibition of Phosphoinositide-3-kinase, Regulatory Subunit, Polypeptide 3 (p55, gamma) (PIK3R3, Accession XM_027982). Accordingly, utilities of VGAM1370 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIK3R3. Zinc Finger Protein 10 (KOX 1)

(ZNF10, Accession NM_015394) is another VGAM1370 host target gene. ZNF10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF10 BINDING SITE, designated SEQ ID:17695, to the nucleotide sequence of VGAM1370 RNA, herein designated VGAM RNA, also designated SEQ ID:4081.

[48173] Another function of VGAM1370 is therefore inhibition of Zinc Finger Protein 10 (KOX 1) (ZNF10, Accession NM_015394), a gene which may function as a transcriptional regulator. Accordingly, utilities of VGAM1370 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF10. The function of ZNF10 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM36.DKFZP564I052 (Accession XM_039660) is another VGAM1370 host target gene. DKFZP564I052 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564I052,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564I052 BINDING SITE, designated SEQ ID:33136, to the nucleotide sequence of VGAM1370 RNA, herein designated VGAM RNA, also designated SEQ ID:4081.

[48174] Another function of VGAM1370 is therefore inhibition of DKFZP564I052 (Accession XM_039660). Accordingly, utilities of VGAM1370 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564I052. FEM-2 (Accession NM_014634) is another VGAM1370 host target gene. FEM-2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FEM-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FEM-2 BINDING SITE, designated SEQ ID:16008, to the nucleotide sequence of VGAM1370 RNA, herein designated VGAM RNA, also designated SEQ ID:4081.

[48175] Another function of VGAM1370 is therefore inhibition of FEM-2 (Accession NM_014634). Accordingly, utilities of

VGAM1370 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FEM-2. Myosin, Heavy Polypeptide 10, Non-muscle (MYH10, Accession XM_044702) is another VGAM1370 host target gene. MYH10 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MYH10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYH10 BINDING SITE, designated SEQ ID:34263, to the nucleotide sequence of VGAM1370 RNA, herein designated VGAM RNA, also designated SEQ ID:4081.

[48176] Another function of VGAM1370 is therefore inhibition of Myosin, Heavy Polypeptide 10, Non-muscle (MYH10, Accession XM_044702). Accordingly, utilities of VGAM1370 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYH10. LOC201283 (Accession XM_017132) is another VGAM1370 host target gene. LOC201283 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC201283, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201283 BINDING SITE, designated SEQ ID:30304, to the nucleotide sequence of VGAM1370 RNA, herein designated VGAM RNA, also designated SEQ ID:4081.

[48177] Another function of VGAM1370 is therefore inhibition of LOC201283 (Accession XM_017132). Accordingly, utilities of VGAM1370 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201283. LOC51321 (Accession NM_016627) is another VGAM1370 host target gene. LOC51321 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC51321, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51321 BINDING SITE, designated SEQ ID:18742, to the nucleotide sequence of VGAM1370 RNA, herein designated VGAM RNA, also designated SEQ ID:4081.

[48178] Another function of VGAM1370 is therefore inhibition of LOC51321 (Accession NM_016627). Accordingly, utilities of VGAM1370 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC51321. LOC91768 (Accession XM_040512) is another VGAM1370 host target gene. LOC91768 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91768, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91768 BINDING SITE, designated SEQ ID:33321, to the nucleotide sequence of VGAM1370 RNA, herein designated VGAM RNA, also designated SEQ ID:4081.

[48179] Another function of VGAM1370 is therefore inhibition of LOC91768 (Accession XM_040512). Accordingly, utilities of VGAM1370 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91768. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1371 (VGAM1371) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48180] VGAM1371 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1371 was detected is described hereinabove with reference to Figs. 1–8.

[48181] VGAM1371 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 6.

VGAM1371 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48182] VGAM1371 gene encodes a VGAM1371 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1371 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1371 precursor RNA is designated SEQ ID:1357, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1357 is located at position 46060 relative to the genome of Human Herpesvirus 6.

[48183] VGAM1371 precursor RNA folds onto itself, forming VGAM1371 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide

sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48184] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1371 folded precursor RNA into VGAM1371 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 53%) nucleotide sequence of VGAM1371 RNA is designated SEQ ID:4082, and is provided hereinbelow with reference to the sequence listing part.

[48185] VGAM1371 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1371 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1371 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[48186] VGAM1371 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1371 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1371 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1371 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1371 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[48187] The complementary binding of VGAM1371 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1371 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1371 host target RNA into VGAM1371 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48188] It is appreciated that VGAM1371 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1371 host target genes. The mRNA of each one of this plurality of VGAM1371 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1371 RNA, herein designated VGAM RNA, and which when bound by VGAM1371 RNA causes inhibition of translation of respective one or more VGAM1371 host target proteins.

[48189] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1371 gene, herein designated VGAM GENE, on one or more VGAM1371 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[48190] It is yet further appreciated that a function of VGAM1371 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1371 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 6. Specific functions, and accordingly utilities, of VGAM1371 correlate with, and may be deduced from, the identity of the host target genes which VGAM1371 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48191] Nucleotide sequences of the VGAM1371 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1371 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM1371 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1371 are further described hereinbelow with reference to Table 1.

[48192] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1371 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1371 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48193] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1371 gene, herein designated VGAM is inhibition of expression of VGAM1371 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1371 correlate with, and may be deduced from, the identity of the target genes which VGAM1371 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[48194] KIAA0092 (Accession NM_014679) is a VGAM1371 host target gene. KIAA0092 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0092, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0092 BINDING SITE, designated SEQ ID:16153, to the nucleotide sequence of VGAM1371 RNA, herein designated VGAM RNA, also designated SEQ ID:4082.

[48195] A function of VGAM1371 is therefore inhibition of KIAA0092 (Accession NM_014679). Accordingly, utilities of VGAM1371 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0092. LOC221979 (Accession XM_166540) is another VGAM1371 host target gene. LOC221979 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221979, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221979 BINDING SITE, designated SEQ ID:44512, to the nucleotide sequence of VGAM1371 RNA, herein designated VGAM RNA, also designated SEQ ID:4082.

[48196] Another function of VGAM1371 is therefore inhibition of LOC221979 (Accession XM_166540). Accordingly, utilities of VGAM1371 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC221979. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1372 (VGAM1372) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48197] VGAM1372 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1372 was detected is described hereinabove with reference to Figs. 1–8.

[48198] VGAM1372 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine Herpesvirus 1. VGAM1372 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48199] VGAM1372 gene encodes a VGAM1372 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1372 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1372 precursor RNA is desig-

nated SEQ ID:1358, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1358 is located at position 29852 relative to the genome of Alcelaphine Herpesvirus 1.

- [48200] VGAM1372 precursor RNA folds onto itself, forming VGAM1372 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [48201] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1372 folded precursor RNA into VGAM1372 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM1372 RNA is designated SEQ ID:4083, and is provided hereinbelow with reference to the sequence

listing part.

[48202] VGAM1372 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1372 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1372 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[48203] VGAM1372 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1372 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1372 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1372 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM1372 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[48204] The complementary binding of VGAM1372 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1372 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1372 host target RNA into VGAM1372 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48205] It is appreciated that VGAM1372 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1372 host target genes. The mRNA of each one of this plurality of VGAM1372 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1372 RNA, herein designated VGAM

RNA, and which when bound by VGAM1372 RNA causes inhibition of translation of respective one or more VGAM1372 host target proteins.

[48206] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1372 gene, herein designated VGAM GENE, on one or more VGAM1372 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[48207] It is yet further appreciated that a function of VGAM1372 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1372 include diagnosis, prevention and treatment of viral infection by Alcelaphine Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1372 correlate with, and may be deduced from, the identity of the host target genes which VGAM1372 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48208] Nucleotide sequences of the VGAM1372 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1372 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1372 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1372 are further described hereinbelow with reference to Table 1.

[48209] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1372 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1372 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48210] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1372 gene, herein designated VGAM is

inhibition of expression of VGAM1372 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1372 correlate with, and may be deduced from, the identity of the target genes which VGAM1372 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[48211] ATPase, H⁺ Transporting, Lysosomal 70kDa, V1 Subunit A, Isoform 1 (ATP6V1A1, Accession NM_001690) is a VGAM1372 host target gene. ATP6V1A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP6V1A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP6V1A1 BINDING SITE, designated SEQ ID:7411, to the nucleotide sequence of VGAM1372 RNA, herein designated VGAM RNA, also designated SEQ ID:4083.

[48212] A function of VGAM1372 is therefore inhibition of ATPase, H⁺ Transporting, Lysosomal 70kDa, V1 Subunit A, Isoform 1 (ATP6V1A1, Accession NM_001690), a gene which is responsible for acidifying a variety of intracellular compartments in eukaryotic cells. Accordingly, utilities of VGAM1372 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with ATP6V1A1. The function of ATP6V1A1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM827. BTG Family, Member 2 (BTG2, Accession NM_006763) is another VGAM1372 host target gene. BTG2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BTG2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BTG2 BINDING SITE, designated SEQ ID:13631, to the nucleotide sequence of VGAM1372 RNA, herein designated VGAM RNA, also designated SEQ ID:4083.

[48213] Another function of VGAM1372 is therefore inhibition of BTG Family, Member 2 (BTG2, Accession NM_006763). Accordingly, utilities of VGAM1372 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BTG2. Catalase (CAT, Accession NM_001752) is another VGAM1372 host target gene. CAT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAT, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAT BINDING SITE, designated SEQ ID:7488, to the nucleotide sequence of VGAM1372 RNA, herein designated VGAM RNA, also designated SEQ ID:4083.

[48214] Another function of VGAM1372 is therefore inhibition of Catalase (CAT, Accession NM_001752). Accordingly, utilities of VGAM1372 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAT. Core-binding Factor, Runt Domain, Alpha Subunit 2; Translocated To, 3 (CBFA2T3, Accession NM_005187) is another VGAM1372 host target gene. CBFA2T3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CBFA2T3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CBFA2T3 BINDING SITE, designated SEQ ID:11690, to the nucleotide sequence of VGAM1372 RNA, herein designated VGAM RNA, also designated SEQ ID:4083.

[48215] Another function of VGAM1372 is therefore inhibition of Core-binding Factor, Runt Domain, Alpha Subunit 2;

Translocated To, 3 (CBFA2T3, Accession NM_005187). Accordingly, utilities of VGAM1372 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CBFA2T3. GM2 Ganglioside Activator Protein (GM2A, Accession XM_041978) is another VGAM1372 host target gene. GM2A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GM2A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GM2A BINDING SITE, designated SEQ ID:33657, to the nucleotide sequence of VGAM1372 RNA, herein designated VGAM RNA, also designated SEQ ID:4083.

[48216] Another function of VGAM1372 is therefore inhibition of GM2 Ganglioside Activator Protein (GM2A, Accession XM_041978). Accordingly, utilities of VGAM1372 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GM2A. Mitogen-activated Protein Kinase 8 Interacting Protein 1 (MAPK8IP1, Accession NM_005456) is another VGAM1372 host target gene. MAPK8IP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

MAPK8IP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAPK8IP1 BINDING SITE, designated SEQ ID:11941, to the nucleotide sequence of VGAM1372 RNA, herein designated VGAM RNA, also designated SEQ ID:4083.

[48217] Another function of VGAM1372 is therefore inhibition of Mitogen-activated Protein Kinase 8 Interacting Protein 1 (MAPK8IP1, Accession NM_005456). Accordingly, utilities of VGAM1372 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPK8IP1. Pyrroline-5-carboxylate Reductase 1 (PYCR1, Accession XM_046472) is another VGAM1372 host target gene. PYCR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PYCR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PYCR1 BINDING SITE, designated SEQ ID:34731, to the nucleotide sequence of VGAM1372 RNA, herein designated VGAM RNA, also designated SEQ ID:4083.

[48218] Another function of VGAM1372 is therefore inhibition of Pyrroline-5-carboxylate Reductase 1 (PYCR1, Accession XM_046472), a gene which catalyzes the NAD(P)H-dependent conversion of pyrroline-5-carboxylate to proline. Accordingly, utilities of VGAM1372 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PYCR1. The function of PYCR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM178. Sal-like 2 (Drosophila) (SALL2, Accession XM_033473) is another VGAM1372 host target gene. SALL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SALL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SALL2 BINDING SITE, designated SEQ ID:31937, to the nucleotide sequence of VGAM1372 RNA, herein designated VGAM RNA, also designated SEQ ID:4083.

[48219] Another function of VGAM1372 is therefore inhibition of Sal-like 2 (Drosophila) (SALL2, Accession XM_033473).

Accordingly, utilities of VGAM1372 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SALL2. Selenoprotein X, 1 (SEPX1, Accession NM_016332) is another VGAM1372 host target gene. SEPX1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEPX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEPX1 BINDING SITE, designated SEQ ID:18458, to the nucleotide sequence of VGAM1372 RNA, herein designated VGAM RNA, also designated SEQ ID:4083.

[48220] Another function of VGAM1372 is therefore inhibition of Selenoprotein X, 1 (SEPX1, Accession NM_016332). Accordingly, utilities of VGAM1372 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEPX1. FLJ11186 (Accession NM_018353) is another VGAM1372 host target gene. FLJ11186 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11186, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

FLJ11186 BINDING SITE, designated SEQ ID:20368, to the nucleotide sequence of VGAM1372 RNA, herein designated VGAM RNA, also designated SEQ ID:4083.

[48221] Another function of VGAM1372 is therefore inhibition of FLJ11186 (Accession NM_018353). Accordingly, utilities of VGAM1372 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11186. KIAA0367 (Accession XM_041018) is another VGAM1372 host target gene. KIAA0367 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0367, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0367 BINDING SITE, designated SEQ ID:33428, to the nucleotide sequence of VGAM1372 RNA, herein designated VGAM RNA, also designated SEQ ID:4083.

[48222] Another function of VGAM1372 is therefore inhibition of KIAA0367 (Accession XM_041018). Accordingly, utilities of VGAM1372 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0367. KIAA0924 (Accession NM_014897) is another VGAM1372 host target gene. KIAA0924 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0924, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0924 BINDING SITE, designated SEQ ID:17069, to the nucleotide sequence of VGAM1372 RNA, herein designated VGAM RNA, also designated SEQ ID:4083.

[48223] Another function of VGAM1372 is therefore inhibition of KIAA0924 (Accession NM_014897). Accordingly, utilities of VGAM1372 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0924. KIAA1503 (Accession XM_043197) is another VGAM1372 host target gene. KIAA1503 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1503, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1503 BINDING SITE, designated SEQ ID:33915, to the nucleotide sequence of VGAM1372 RNA, herein designated VGAM RNA, also designated SEQ ID:4083.

[48224] Another function of VGAM1372 is therefore inhibition of

KIAA1503 (Accession XM_043197). Accordingly, utilities of VGAM1372 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1503. Spermatid Perinuclear RNA Binding Protein (STRBP, Accession NM_018387) is another VGAM1372 host target gene. STRBP BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by STRBP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STRBP BINDING SITE, designated SEQ ID:20419, to the nucleotide sequence of VGAM1372 RNA, herein designated VGAM RNA, also designated SEQ ID:4083.

[48225] Another function of VGAM1372 is therefore inhibition of Spermatid Perinuclear RNA Binding Protein (STRBP, Accession NM_018387). Accordingly, utilities of VGAM1372 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STRBP. LOC134266 (Accession XM_059701) is another VGAM1372 host target gene. LOC134266 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC134266, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC134266 BINDING SITE, designated SEQ ID:37069, to the nucleotide sequence of VGAM1372 RNA, herein designated VGAM RNA, also designated SEQ ID:4083.

[48226] Another function of VGAM1372 is therefore inhibition of LOC134266 (Accession XM_059701). Accordingly, utilities of VGAM1372 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC134266. LOC149506 (Accession XM_097661) is another VGAM1372 host target gene. LOC149506 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149506, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149506 BINDING SITE, designated SEQ ID:41007, to the nucleotide sequence of VGAM1372 RNA, herein designated VGAM RNA, also designated SEQ ID:4083.

[48227] Another function of VGAM1372 is therefore inhibition of LOC149506 (Accession XM_097661). Accordingly, utilities of VGAM1372 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC149506. LOC158364 (Accession XM_088546) is another VGAM1372 host target gene. LOC158364 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC158364, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158364 BINDING SITE, designated SEQ ID:39815, to the nucleotide sequence of VGAM1372 RNA, herein designated VGAM RNA, also designated SEQ ID:4083.

[48228] Another function of VGAM1372 is therefore inhibition of LOC158364 (Accession XM_088546). Accordingly, utilities of VGAM1372 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158364. LOC200470 (Accession XM_117235) is another VGAM1372 host target gene. LOC200470 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC200470, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200470 BINDING SITE, designated SEQ ID:43310, to

the nucleotide sequence of VGAM1372 RNA, herein designated VGAM RNA, also designated SEQ ID:4083.

[48229] Another function of VGAM1372 is therefore inhibition of LOC200470 (Accession XM_117235). Accordingly, utilities of VGAM1372 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200470. LOC201627 (Accession XM_114353) is another VGAM1372 host target gene. LOC201627 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC201627, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201627 BINDING SITE, designated SEQ ID:42899, to the nucleotide sequence of VGAM1372 RNA, herein designated VGAM RNA, also designated SEQ ID:4083.

[48230] Another function of VGAM1372 is therefore inhibition of LOC201627 (Accession XM_114353). Accordingly, utilities of VGAM1372 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201627. LOC221042 (Accession XM_167669) is another VGAM1372 host target gene. LOC221042 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC221042, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221042 BINDING SITE, designated SEQ ID:44755, to the nucleotide sequence of VGAM1372 RNA, herein designated VGAM RNA, also designated SEQ ID:4083.

[48231] Another function of VGAM1372 is therefore inhibition of LOC221042 (Accession XM_167669). Accordingly, utilities of VGAM1372 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221042. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1373 (VGAM1373) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48232] VGAM1373 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1373 was detected is described hereinabove with reference to Figs. 1-8.

[48233] VGAM1373 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Alcelaphine Herpesvirus 1. VGAM1373 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48234] VGAM1373 gene encodes a VGAM1373 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1373 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1373 precursor RNA is designated SEQ ID:1359, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1359 is located at position 26710 relative to the genome of Alcelaphine Herpesvirus 1.

[48235] VGAM1373 precursor RNA folds onto itself, forming VGAM1373 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48236] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1373 folded precursor RNA into VGAM1373 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1373 RNA is designated SEQ ID:4084, and is provided hereinbelow with reference to the sequence listing part.

[48237] VGAM1373 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1373 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1373 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[48238] VGAM1373 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1373 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1373 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1373 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1373 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[48239] The complementary binding of VGAM1373 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1373 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1373

host target RNA into VGAM1373 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48240] It is appreciated that VGAM1373 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1373 host target genes. The mRNA of each one of this plurality of VGAM1373 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1373 RNA, herein designated VGAM RNA, and which when bound by VGAM1373 RNA causes inhibition of translation of respective one or more VGAM1373 host target proteins.

[48241] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1373 gene, herein designated VGAM GENE, on one or more VGAM1373 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[48242] It is yet further appreciated that a function of VGAM1373 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1373 include diagnosis, prevention and treatment of viral infection by Alcelaphine Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1373 correlate with, and may be deduced from, the identity of the host target genes which VGAM1373 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48243] Nucleotide sequences of the VGAM1373 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1373 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1373 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1373 are further

described hereinbelow with reference to Table 1.

[48244] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1373 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1373 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48245] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1373 gene, herein designated VGAM is inhibition of expression of VGAM1373 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1373 correlate with, and may be deduced from, the identity of the target genes which VGAM1373 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[48246] Disrupted In Schizophrenia 1 (DISC1, Accession NM_018662) is a VGAM1373 host target gene. DISC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DISC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of DISC1 BINDING SITE, designated SEQ ID:20741, to the nucleotide sequence of VGAM1373 RNA, herein designated VGAM RNA, also designated SEQ ID:4084.

[48247] A function of VGAM1373 is therefore inhibition of Disrupted In Schizophrenia 1 (DISC1, Accession NM_018662), a gene which has globular N-terminal domain(s) and a helical C-terminal domain. Accordingly, utilities of VGAM1373 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DISC1. The function of DISC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74. Epithelial V-like Antigen 1 (EVA1, Accession NM_005797) is another VGAM1373 host target gene. EVA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EVA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EVA1 BINDING SITE, designated SEQ ID:12380, to the nucleotide sequence of VGAM1373 RNA, herein designated VGAM RNA, also designated SEQ ID:4084.

[48248] Another function of VGAM1373 is therefore inhibition of

Epithelial V-like Antigen 1 (EVA1, Accession NM_005797). Accordingly, utilities of VGAM1373 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EVA1. Coagulation Factor XIII, A1 Polypeptide (F13A1, Accession XM_165833) is another VGAM1373 host target gene. F13A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by F13A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of F13A1 BINDING SITE, designated SEQ ID:43773, to the nucleotide sequence of VGAM1373 RNA, herein designated VGAM RNA, also designated SEQ ID:4084.

[48249] Another function of VGAM1373 is therefore inhibition of Coagulation Factor XIII, A1 Polypeptide (F13A1, Accession XM_165833). Accordingly, utilities of VGAM1373 include diagnosis, prevention and treatment of diseases and clinical conditions associated with F13A1. Glycoprotein M6A (GPM6A, Accession NM_005277) is another VGAM1373 host target gene. GPM6A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GPM6A, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPM6A BINDING SITE, designated SEQ ID:11780, to the nucleotide sequence of VGAM1373 RNA, herein designated VGAM RNA, also designated SEQ ID:4084.

[48250] Another function of VGAM1373 is therefore inhibition of Glycoprotein M6A (GPM6A, Accession NM_005277), a gene which may play a role in neuronal development. Accordingly, utilities of VGAM1373 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPM6A. The function of GPM6A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM326. Kinesin Family Member 5C (KIF5C, Accession NM_004522) is another VGAM1373 host target gene. KIF5C BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIF5C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIF5C BINDING SITE, designated SEQ ID:10851, to the nucleotide sequence of

VGAM1373 RNA, herein designated VGAM RNA, also designated SEQ ID:4084.

[48251] Another function of VGAM1373 is therefore inhibition of Kinesin Family Member 5C (KIF5C, Accession NM_004522). Accordingly, utilities of VGAM1373 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIF5C. Microtubule-associated Protein 7 (MAP7, Accession NM_003980) is another VGAM1373 host target gene. MAP7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAP7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP7 BINDING SITE, designated SEQ ID:10117, to the nucleotide sequence of VGAM1373 RNA, herein designated VGAM RNA, also designated SEQ ID:4084.

[48252] Another function of VGAM1373 is therefore inhibition of Microtubule-associated Protein 7 (MAP7, Accession NM_003980), a gene which Microtubule-associated protein 7; stabilizes microtubules, may help establish epithelial cell polarity. Accordingly, utilities of VGAM1373 include diagnosis, prevention and treatment of diseases and

clinical conditions associated with MAP7. The function of MAP7 has been established by previous studies. By screening a HeLa cell expression library with antisera raised against crude microtubule-binding proteins from HeLa cells, Masson and Kreis (1993) isolated cDNAs encoding MAP7, which they designated EMAP115. The predicted 749-amino acid protein has a calculated molecular mass of 84 kD, although it migrates anomalously at 115 kD by SDS-PAGE. EMAP115 contains a basic, highly charged N-terminal region that is separated from an acidic C-terminal half by a stretch of amino acids rich in proline and alanine (PAPA region). The N-terminal basic domain contains the EMAP115 microtubule-binding site. Using immunoblots, the authors determined that EMAP115 is predominantly expressed in cells of epithelial origin. Immunofluorescence and immunoelectron microscopy indicated that it is specifically associated with microtubules in HeLa cells. Overexpression of the N-terminal microtubule-binding domain in monkey fibroblasts, which do not have significant levels of endogenous EMAP115, led to stabilization of microtubules. Masson and Kreis (1993) concluded that EMAP115 is a microtubule-stabilizing protein that may play an important role

in reorganization of microtubules during polarization and differentiation of epithelial cells. Vitamin A deficiency causes a number of defects, including deficient spermatogenesis. Almost all of these defects are reversible by the administration of a vitamin A metabolite, retinoic acid (RA), which binds and activates 2 types of receptor families, RAR (e.g., RARA; 180240) and RXR (e.g., RXRA; 180245). Using gene trap mutagenesis on mouse embryonic stem (ES) cells, Komada et al. (2000) identified MAP7 as an RA-responsive gene. The gene trap insertion led to a mutation in the Map7 gene that the authors designated ROSA63. Northern blot analysis detected broad expression of a 3.4-kb Map7 transcript, as well as a testis-specific 2.5-kb transcript, in wildtype mice, with lower expression in heterozygous ROSA63 mice and no expression in homozygous ROSA63 mice, consistent with a null allele. The authors showed that RA induces Map7 expression in ES cells in vitro and in vitamin A-deficient mice in vivo. Male mice with the ROSA63 mutation, though able to copulate, were sterile and had smaller testes and epididymis than wildtype mice, while other organs were of normal size. Histologic analysis showed that ROSA63 mutant mice exhibited defective spermatogenesis, with sper-

matid deformation in the first wave of spermatogenesis and subsequent germ cell loss. Both of these abnormalities were associated with morphologically abnormal MTs in the manchette of the spermatids and in Sertoli cells. Komada et al. (2000) noted that similar defects occur in Rara knockout mice, but not in other RA receptor knockout mice.

[48253] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[48254] Komada, M.; McLean, D. J.; Griswold, M. D.; Russell, L. D.; Soriano, P. : E-MAP-115, encoding a microtubule-associated protein, is a retinoic acid-inducible gene required for spermatogenesis. *Genes Dev.* 14: 1332-1342, 2000. ; and

[48255] Masson, D.; Kreis, T. E. : Identification and molecular characterization of E-MAP-115, a novel microtubule-associated protein predominantly expressed in epithelial cells. *J. Cell Biol.*

[48256] Further studies establishing the function and utilities of MAP7 are found in John Hopkins OMIM database record ID 604108, and in cited publications numbered 7059-7060 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Recombination Ac-

tivating Gene 1 (RAG1, Accession NM_000448) is another VGAM1373 host target gene. RAG1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RAG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAG1 BINDING SITE, designated SEQ ID:6043, to the nucleotide sequence of VGAM1373 RNA, herein designated VGAM RNA, also designated SEQ ID:4084.

[48257] Another function of VGAM1373 is therefore inhibition of Recombination Activating Gene 1 (RAG1, Accession NM_000448). Accordingly, utilities of VGAM1373 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAG1. Transcription Factor Dp-2 (E2F dimerization partner 2) (TFDP2, Accession NM_006286) is another VGAM1373 host target gene. TFDP2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TFDP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TFDP2 BINDING SITE, designated SEQ

ID:12974, to the nucleotide sequence of VGAM1373 RNA, herein designated VGAM RNA, also designated SEQ ID:4084.

[48258] Another function of VGAM1373 is therefore inhibition of Transcription Factor Dp-2 (E2F dimerization partner 2) (TFDP2, Accession NM_006286), a gene which is required for the progression of S-phase during the cell cycle. Accordingly, utilities of VGAM1373 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TFDP2. The function of TFDP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM222. KIAA1819 (Accession XM_045716) is another VGAM1373 host target gene. KIAA1819 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1819, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1819 BINDING SITE, designated SEQ ID:34537, to the nucleotide sequence of VGAM1373 RNA, herein designated VGAM RNA, also designated SEQ ID:4084.

[48259] Another function of VGAM1373 is therefore inhibition of KIAA1819 (Accession XM_045716). Accordingly, utilities of VGAM1373 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1819. MGC15619 (Accession NM_032369) is another VGAM1373 host target gene. MGC15619 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC15619, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC15619 BINDING SITE, designated SEQ ID:26157, to the nucleotide sequence of VGAM1373 RNA, herein designated VGAM RNA, also designated SEQ ID:4084.

[48260] Another function of VGAM1373 is therefore inhibition of MGC15619 (Accession NM_032369). Accordingly, utilities of VGAM1373 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC15619. LOC115294 (Accession XM_054302) is another VGAM1373 host target gene. LOC115294 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC115294, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115294 BINDING SITE, designated SEQ ID:36146, to the nucleotide sequence of VGAM1373 RNA, herein designated VGAM RNA, also designated SEQ ID:4084.

[48261] Another function of VGAM1373 is therefore inhibition of LOC115294 (Accession XM_054302). Accordingly, utilities of VGAM1373 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115294. LOC158357 (Accession XM_088553) is another VGAM1373 host target gene. LOC158357 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158357, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158357 BINDING SITE, designated SEQ ID:39820, to the nucleotide sequence of VGAM1373 RNA, herein designated VGAM RNA, also designated SEQ ID:4084.

[48262] Another function of VGAM1373 is therefore inhibition of LOC158357 (Accession XM_088553). Accordingly, utilities of VGAM1373 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC158357. LOC256905 (Accession XM_173031) is another VGAM1373 host target gene. LOC256905 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC256905, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256905 BINDING SITE, designated SEQ ID:46295, to the nucleotide sequence of VGAM1373 RNA, herein designated VGAM RNA, also designated SEQ ID:4084.

[48263] Another function of VGAM1373 is therefore inhibition of LOC256905 (Accession XM_173031). Accordingly, utilities of VGAM1373 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256905. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1374 (VGAM1374) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48264] VGAM1374 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1374 was detected is described hereinabove with reference to Figs. 1–8.

[48265] VGAM1374 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine Herpesvirus 1. VGAM1374 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48266] VGAM1374 gene encodes a VGAM1374 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1374 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1374 precursor RNA is designated SEQ ID:1360, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1360 is located at position 27936 relative to the genome of Alcelaphine Herpesvirus 1.

[48267] VGAM1374 precursor RNA folds onto itself, forming VGAM1374 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide

sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48268] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1374 folded precursor RNA into VGAM1374 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1374 RNA is designated SEQ ID:4085, and is provided hereinbelow with reference to the sequence listing part.

[48269] VGAM1374 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1374 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1374 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[48270] VGAM1374 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1374 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1374 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1374 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1374 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[48271] The complementary binding of VGAM1374 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1374 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1374 host target RNA into VGAM1374 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48272] It is appreciated that VGAM1374 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1374 host target genes. The mRNA of each one of this plurality of VGAM1374 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1374 RNA, herein designated VGAM RNA, and which when bound by VGAM1374 RNA causes inhibition of translation of respective one or more VGAM1374 host target proteins.

[48273] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1374 gene, herein designated VGAM GENE, on one or more VGAM1374 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[48274] It is yet further appreciated that a function of VGAM1374 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1374 include diagnosis, prevention and treatment of viral infection by Alcelaphine Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1374 correlate with, and may be deduced from, the identity of the host target genes which VGAM1374 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48275] Nucleotide sequences of the VGAM1374 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1374 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM1374 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1374 are further described hereinbelow with reference to Table 1.

[48276] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1374 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1374 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48277] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1374 gene, herein designated VGAM is inhibition of expression of VGAM1374 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1374 correlate with, and may be deduced from, the identity of the target genes which VGAM1374 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[48278] Cannabinoid Receptor 1 (brain) (CNR1, Accession NM_016083) is a VGAM1374 host target gene. CNR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CNR1, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNR1 BINDING SITE, designated SEQ ID:18160, to the nucleotide sequence of VGAM1374 RNA, herein designated VGAM RNA, also designated SEQ ID:4085.

[48279] A function of VGAM1374 is therefore inhibition of Cannabinoid Receptor 1 (brain) (CNR1, Accession NM_016083), a gene which is involved in the cannabinoid-induced CNS effects. Accordingly, utilities of VGAM1374 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNR1. The function of CNR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM533. Killer Cell Lectin-like Receptor Subfamily G, Member 1 (KLRG1, Accession NM_005810) is another VGAM1374 host target gene. KLRG1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KLRG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KLRG1 BINDING SITE,

designated SEQ ID:12391, to the nucleotide sequence of VGAM1374 RNA, herein designated VGAM RNA, also designated SEQ ID:4085.

[48280] Another function of VGAM1374 is therefore inhibition of Killer Cell Lectin-like Receptor Subfamily G, Member 1 (KLRG1, Accession NM_005810), a gene which plays a role in host defense;. Accordingly, utilities of VGAM1374 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLRG1. The function of KLRG1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM648.FLJ25416 (Accession NM_145018) is another VGAM1374 host target gene. FLJ25416 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ25416, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ25416 BINDING SITE, designated SEQ ID:29623, to the nucleotide sequence of VGAM1374 RNA, herein designated VGAM RNA, also designated SEQ ID:4085.

[48281] Another function of VGAM1374 is therefore inhibition of

FLJ25416 (Accession NM_145018). Accordingly, utilities of VGAM1374 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ25416. PFTAIRES Protein Kinase 1 (PFTK1, Accession NM_012395) is another VGAM1374 host target gene. PFTK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PFTK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PFTK1 BINDING SITE, designated SEQ ID:14749, to the nucleotide sequence of VGAM1374 RNA, herein designated VGAM RNA, also designated SEQ ID:4085.

[48282] Another function of VGAM1374 is therefore inhibition of PFTAIRES Protein Kinase 1 (PFTK1, Accession NM_012395). Accordingly, utilities of VGAM1374 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PFTK1. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1375 (VGAM1375) viral gene, which modulates expression of respective host tar-

get genes thereof, the function and utility of which host target genes is known in the art.

[48283] VGAM1375 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1375 was detected is described hereinabove with reference to Figs. 1–8.

[48284] VGAM1375 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine Herpesvirus 1. VGAM1375 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48285] VGAM1375 gene encodes a VGAM1375 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1375 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1375 precursor RNA is designated SEQ ID:1361, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1361 is located at position 32330 relative to the genome of Alcelaphine Herpesvirus 1.

[48286] VGAM1375 precursor RNA folds onto itself, forming VGAM1375 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48287] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1375 folded precursor RNA into VGAM1375 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1375 RNA is designated SEQ ID:4086, and is provided hereinbelow with reference to the sequence listing part.

[48288] VGAM1375 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1375 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1375 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[48289] VGAM1375 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1375 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1375 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1375 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1375 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[48290] The complementary binding of VGAM1375 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1375 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1375 host target RNA into VGAM1375 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48291] It is appreciated that VGAM1375 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1375 host target genes. The mRNA of each one of this plurality of VGAM1375 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1375 RNA, herein designated VGAM RNA, and which when bound by VGAM1375 RNA causes inhibition of translation of respective one or more VGAM1375 host target proteins.

[48292] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1375 gene, herein designated VGAM GENE, on one or more VGAM1375 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[48293] It is yet further appreciated that a function of VGAM1375 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1375 include diagnosis, prevention and treatment of viral infection by Alcelaphine Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1375 correlate with, and may be deduced from, the identity of the host target genes which VGAM1375 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[48294] Nucleotide sequences of the VGAM1375 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1375 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1375 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1375 are further described hereinbelow with reference to Table 1.

[48295] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1375 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1375 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48296] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1375 gene, herein designated VGAM is inhibition of expression of VGAM1375 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1375 correlate with, and may be deduced from, the identity of the target genes which VGAM1375 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[48297] Solute Carrier Family 17 (anion/sugar transporter), Member 5 (SLC17A5, Accession NM_012434) is a VGAM1375 host target gene. SLC17A5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC17A5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC17A5 BINDING SITE, designated SEQ ID:14813, to the nucleotide sequence of VGAM1375 RNA, herein designated VGAM RNA, also designated SEQ ID:4086.

[48298] A function of VGAM1375 is therefore inhibition of Solute Carrier Family 17 (anion/sugar transporter), Member 5 (SLC17A5, Accession NM_012434), a gene which is a member of a family of anion/cation symporters. Accordingly, utilities of VGAM1375 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC17A5. The function of SLC17A5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM766. Spectrin, Beta, Non-erythrocytic 1 (SPTBN1, Accession NM_003128) is another VGAM1375 host target gene. SPTBN1 BINDING SITE is

HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SPTBN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPTBN1 BINDING SITE, designated SEQ ID:9095, to the nucleotide sequence of VGAM1375 RNA, herein designated VGAM RNA, also designated SEQ ID:4086.

[48299] Another function of VGAM1375 is therefore inhibition of Spectrin, Beta, Non-erythrocytic 1 (SPTBN1, Accession NM_003128), a gene which seems to be involved in secretion. Accordingly, utilities of VGAM1375 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPTBN1. The function of SPTBN1 has been established by previous studies. Immunochemical studies demonstrate the existence of beta-spectrin-like polypeptides in nonerythroid tissues. Watkins et al. (1988) obtained a genomic clone for nonerythroid beta-spectrin by screening a DNA library with a synthetic oligonucleotide probe corresponding to human erythroid beta-spectrin (OMIM Ref. No. 182870) cDNA. The genomic clone showed 76% homology to the erythroid beta-spectrin cDNA when translated to amino acid sequence.

Watkins et al. (1988) used the genomic clone to map the gene to human chromosome 2 by study of DNA from somatic cell hybrids. Chang et al. (1993) found that the genomic DNA for human brain beta-fodrin contained regions that cross-hybridized with an erythroid beta-spectrin cDNA probe and that the DNA sequence of these regions showed a high degree of identity and a similar exon/intron organization. By hybridization to DNA of a panel of somatic hybrid cell lines, they mapped the gene to chromosome 2 and localized the gene to 2p21 by isotopic in situ hybridization.

[48300] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[48301] Chang, J. G.; Scarpa, A.; Eddy, R. L.; Byers, M. G.; Harris, A. S.; Morrow, J. S.; Watkins, P.; Shows, T. B.; Forget, B. G. : Cloning of a portion of the chromosomal gene and cDNA for human beta-fodrin, the nonerythroid form of beta-spectrin. *Genomics* 17: 287-293, 1993. ; and

[48302] Watkins, P. C.; Eddy, R.; Forget, B. G.; Chang, J. G.; Rochelle, R.; Shows, T. B. : Assignment of a non-erythroid spectrin gene to human chromosome 2. (Abstract) *Am. J. Hum. Genet.* 43: A16.

[48303] Further studies establishing the function and utilities of SPTBN1 are found in John Hopkins OMIM database record ID 182790, and in cited publications numbered 10090–10091 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Thymidine Kinase 2, Mitochondrial (TK2, Accession NM_004614) is another VGAM1375 host target gene. TK2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TK2 BINDING SITE, designated SEQ ID:10957, to the nucleotide sequence of VGAM1375 RNA, herein designated VGAM RNA, also designated SEQ ID:4086.

[48304] Another function of VGAM1375 is therefore inhibition of Thymidine Kinase 2, Mitochondrial (TK2, Accession NM_004614), a gene which phosphorylates thymidine, deoxycytidine, deoxyuridine, and also anti-viral and anti-cancer nucleoside analogs. Accordingly, utilities of VGAM1375 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TK2. The function of TK2 and its association with various dis-

eases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM210.CBCIP2 (Accession NM_032831) is another VGAM1375 host target gene. CBCIP2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CBCIP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CBCIP2 BINDING SITE, designated SEQ ID:26605, to the nucleotide sequence of VGAM1375 RNA, herein designated VGAM RNA, also designated SEQ ID:4086.

[48305] Another function of VGAM1375 is therefore inhibition of CBCIP2 (Accession NM_032831). Accordingly, utilities of VGAM1375 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CBCIP2. Doublecortin and CaM Kinase-like 1 (DCAMKL1, Accession NM_004734) is another VGAM1375 host target gene. DCAMKL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DCAMKL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of DCAMKL1 BINDING SITE, designated SEQ ID:11116, to the nucleotide sequence of VGAM1375 RNA, herein designated VGAM RNA, also designated SEQ ID:4086.

[48306] Another function of VGAM1375 is therefore inhibition of Doublecortin and CaM Kinase-like 1 (DCAMKL1, Accession NM_004734). Accordingly, utilities of VGAM1375 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DCAMKL1. DKFZp761F2014 (Accession NM_020215) is another VGAM1375 host target gene. DKFZp761F2014 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp761F2014, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761F2014 BINDING SITE, designated SEQ ID:21460, to the nucleotide sequence of VGAM1375 RNA, herein designated VGAM RNA, also designated SEQ ID:4086.

[48307] Another function of VGAM1375 is therefore inhibition of DKFZp761F2014 (Accession NM_020215). Accordingly, utilities of VGAM1375 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with DKFZp761F2014. ElaC Homolog 1 (E. coli) (ELAC1, Accession XM_165659) is another VGAM1375 host target gene. ELAC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ELAC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ELAC1 BINDING SITE, designated SEQ ID:43722, to the nucleotide sequence of VGAM1375 RNA, herein designated VGAM RNA, also designated SEQ ID:4086.

[48308] Another function of VGAM1375 is therefore inhibition of ElaC Homolog 1 (E. coli) (ELAC1, Accession XM_165659). Accordingly, utilities of VGAM1375 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ELAC1. FLJ00007 (Accession XM_048928) is another VGAM1375 host target gene. FLJ00007 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ00007, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ00007 BINDING SITE, designated SEQ

ID:35306, to the nucleotide sequence of VGAM1375 RNA, herein designated VGAM RNA, also designated SEQ ID:4086.

[48309] Another function of VGAM1375 is therefore inhibition of FLJ00007 (Accession XM_048928). Accordingly, utilities of VGAM1375 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00007. FLJ14768 (Accession NM_032836) is another VGAM1375 host target gene. FLJ14768 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14768, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14768 BINDING SITE, designated SEQ ID:26614, to the nucleotide sequence of VGAM1375 RNA, herein designated VGAM RNA, also designated SEQ ID:4086.

[48310] Another function of VGAM1375 is therefore inhibition of FLJ14768 (Accession NM_032836). Accordingly, utilities of VGAM1375 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14768. GFR (Accession NM_012294) is another VGAM1375 host target gene. GFR BINDING SITE is HOST

TARGET binding site found in the 3` untranslated region of mRNA encoded by GFR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GFR BINDING SITE, designated SEQ ID:14632, to the nucleotide sequence of VGAM1375 RNA, herein designated VGAM RNA, also designated SEQ ID:4086.

[48311] Another function of VGAM1375 is therefore inhibition of GFR (Accession NM_012294). Accordingly, utilities of VGAM1375 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GFR. KIAA0346 (Accession XM_043272) is another VGAM1375 host target gene. KIAA0346 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0346, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0346 BINDING SITE, designated SEQ ID:33919, to the nucleotide sequence of VGAM1375 RNA, herein designated VGAM RNA, also designated SEQ ID:4086.

[48312] Another function of VGAM1375 is therefore inhibition of

KIAA0346 (Accession XM_043272). Accordingly, utilities of VGAM1375 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0346. KIAA1327 (Accession XM_051146) is another VGAM1375 host target gene. KIAA1327 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1327, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1327 BINDING SITE, designated SEQ ID:35762, to the nucleotide sequence of VGAM1375 RNA, herein designated VGAM RNA, also designated SEQ ID:4086.

[48313] Another function of VGAM1375 is therefore inhibition of KIAA1327 (Accession XM_051146). Accordingly, utilities of VGAM1375 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1327. P17.3 (Accession NM_019056) is another VGAM1375 host target gene. P17.3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by P17.3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of P17.3 BINDING SITE, designated SEQ ID:21139, to the nucleotide sequence of VGAM1375 RNA, herein designated VGAM RNA, also designated SEQ ID:4086.

[48314] Another function of VGAM1375 is therefore inhibition of P17.3 (Accession NM_019056). Accordingly, utilities of VGAM1375 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P17.3. Ras Association (RalGDS/AF-6) Domain Family 2 (RASSF2, Accession NM_014737) is another VGAM1375 host target gene. RASSF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RASSF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RASSF2 BINDING SITE, designated SEQ ID:16390, to the nucleotide sequence of VGAM1375 RNA, herein designated VGAM RNA, also designated SEQ ID:4086.

[48315] Another function of VGAM1375 is therefore inhibition of Ras Association (RalGDS/AF-6) Domain Family 2 (RASSF2, Accession NM_014737). Accordingly, utilities of VGAM1375 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with RASSF2. Testis Expressed Sequence 27 (TEX27, Accession NM_021943) is another VGAM1375 host target gene. TEX27 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TEX27, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TEX27 BINDING SITE, designated SEQ ID:22458, to the nucleotide sequence of VGAM1375 RNA, herein designated VGAM RNA, also designated SEQ ID:4086.

[48316] Another function of VGAM1375 is therefore inhibition of Testis Expressed Sequence 27 (TEX27, Accession NM_021943). Accordingly, utilities of VGAM1375 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TEX27. VI (Accession NM_013443) is another VGAM1375 host target gene. VI BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by VI, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

VI BINDING SITE, designated SEQ ID:15106, to the nucleotide sequence of VGAM1375 RNA, herein designated VGAM RNA, also designated SEQ ID:4086.

[48317] Another function of VGAM1375 is therefore inhibition of VI (Accession NM_013443). Accordingly, utilities of VGAM1375 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VI. LOC150935 (Accession XM_087049) is another VGAM1375 host target gene. LOC150935 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150935, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150935 BINDING SITE, designated SEQ ID:39017, to the nucleotide sequence of VGAM1375 RNA, herein designated VGAM RNA, also designated SEQ ID:4086.

[48318] Another function of VGAM1375 is therefore inhibition of LOC150935 (Accession XM_087049). Accordingly, utilities of VGAM1375 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150935. LOC196955 (Accession XM_085210) is another VGAM1375 host target gene. LOC196955 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC196955, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196955 BINDING SITE, designated SEQ ID:37928, to the nucleotide sequence of VGAM1375 RNA, herein designated VGAM RNA, also designated SEQ ID:4086.

[48319] Another function of VGAM1375 is therefore inhibition of LOC196955 (Accession XM_085210). Accordingly, utilities of VGAM1375 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196955. LOC222008 (Accession XM_168361) is another VGAM1375 host target gene. LOC222008 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC222008, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222008 BINDING SITE, designated SEQ ID:45122, to the nucleotide sequence of VGAM1375 RNA, herein designated VGAM RNA, also designated SEQ ID:4086.

[48320] Another function of VGAM1375 is therefore inhibition of

LOC222008 (Accession XM_168361). Accordingly, utilities of VGAM1375 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222008. LOC57805 (Accession NM_021174) is another VGAM1375 host target gene. LOC57805 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC57805, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC57805 BINDING SITE, designated SEQ ID:22149, to the nucleotide sequence of VGAM1375 RNA, herein designated VGAM RNA, also designated SEQ ID:4086.

[48321] Another function of VGAM1375 is therefore inhibition of LOC57805 (Accession NM_021174). Accordingly, utilities of VGAM1375 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC57805. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1376 (VGAM1376) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[48322] VGAM1376 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1376 was detected is described hereinabove with reference to Figs. 1–8.

[48323] VGAM1376 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine Herpesvirus 1. VGAM1376 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48324] VGAM1376 gene encodes a VGAM1376 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1376 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1376 precursor RNA is designated SEQ ID:1362, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1362 is located at position 28622 relative to the genome of Alcelaphine Herpesvirus 1.

[48325] VGAM1376 precursor RNA folds onto itself, forming VGAM1376 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two–

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48326] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1376 folded precursor RNA into VGAM1376 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1376 RNA is designated SEQ ID:4087, and is provided hereinbelow with reference to the sequence listing part.

[48327] VGAM1376 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1376 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1376 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[48328] VGAM1376 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1376 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1376 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1376 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1376 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[48329] The complementary binding of VGAM1376 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1376 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1376 host target RNA into VGAM1376 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48330] It is appreciated that VGAM1376 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1376 host target genes. The mRNA of each one of this plurality of VGAM1376 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1376 RNA, herein designated VGAM RNA, and which when bound by VGAM1376 RNA causes inhibition of translation of respective one or more VGAM1376 host target proteins.

[48331] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1376 gene, herein designated VGAM GENE, on one

or more VGAM1376 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[48332] It is yet further appreciated that a function of VGAM1376 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1376 include diagnosis, prevention and treatment of viral infection by Alcelaphine Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1376 correlate with, and may be deduced from, the identity of the host target genes which VGAM1376 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48333] Nucleotide sequences of the VGAM1376 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1376 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1376 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1376 are further described hereinbelow with reference to Table 1.

[48334] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1376 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1376 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48335] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1376 gene, herein designated VGAM is inhibition of expression of VGAM1376 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1376 correlate with, and may be deduced from, the identity of the target genes which VGAM1376 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[48336] Transcobalamin II; Macrocytic Anemia (TCN2, Accession

NM_000355) is a VGAM1376 host target gene. TCN2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TCN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCN2 BINDING SITE, designated SEQ ID:5915, to the nucleotide sequence of VGAM1376 RNA, herein designated VGAM RNA, also designated SEQ ID:4087.

[48337] A function of VGAM1376 is therefore inhibition of Transcobalamin II; Macrocytic Anemia (TCN2, Accession NM_000355). Accordingly, utilities of VGAM1376 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCN2. Transient Receptor Potential Cation Channel, Subfamily C, Member 6 (TRPC6, Accession NM_004621) is another VGAM1376 host target gene. TRPC6 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TRPC6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPC6 BINDING SITE, designated SEQ ID:10974, to the nucleotide sequence of VGAM1376 RNA,

herein designated VGAM RNA, also designated SEQ ID:4087.

[48338] Another function of VGAM1376 is therefore inhibition of Transient Receptor Potential Cation Channel, Subfamily C, Member 6 (TRPC6, Accession NM_004621), a gene which has calcium channel activity. Accordingly, utilities of VGAM1376 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPC6. The function of TRPC6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM25.DKFZP434F091 (Accession NM_015453) is another VGAM1376 host target gene. DKFZP434F091 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZP434F091, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434F091 BINDING SITE, designated SEQ ID:17738, to the nucleotide sequence of VGAM1376 RNA, herein designated VGAM RNA, also designated SEQ ID:4087.

[48339] Another function of VGAM1376 is therefore inhibition of

DKFZP434F091 (Accession NM_015453). Accordingly, utilities of VGAM1376 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434F091. FLJ23132 (Accession XM_171194) is another VGAM1376 host target gene. FLJ23132 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ23132, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23132 BINDING SITE, designated SEQ ID:45981, to the nucleotide sequence of VGAM1376 RNA, herein designated VGAM RNA, also designated SEQ ID:4087.

[48340] Another function of VGAM1376 is therefore inhibition of FLJ23132 (Accession XM_171194). Accordingly, utilities of VGAM1376 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23132. Netrin 4 (NTN4, Accession XM_031896) is another VGAM1376 host target gene. NTN4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NTN4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of NTN4 BINDING SITE, designated SEQ ID:31512, to the nucleotide sequence of VGAM1376 RNA, herein designated VGAM RNA, also designated SEQ ID:4087.

[48341] Another function of VGAM1376 is therefore inhibition of Netrin 4 (NTN4, Accession XM_031896). Accordingly, utilities of VGAM1376 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NTN4. SEC61A1 (Accession NM_013336) is another VGAM1376 host target gene. SEC61A1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SEC61A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEC61A1 BINDING SITE, designated SEQ ID:14984, to the nucleotide sequence of VGAM1376 RNA, herein designated VGAM RNA, also designated SEQ ID:4087.

[48342] Another function of VGAM1376 is therefore inhibition of SEC61A1 (Accession NM_013336). Accordingly, utilities of VGAM1376 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEC61A1. TGFB-induced Factor 2 (TALE family homeobox)

(TGIF2, Accession NM_021809) is another VGAM1376 host target gene. TGIF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TGIF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TGIF2 BINDING SITE, designated SEQ ID:22365, to the nucleotide sequence of VGAM1376 RNA, herein designated VGAM RNA, also designated SEQ ID:4087.

[48343] Another function of VGAM1376 is therefore inhibition of TGFB-induced Factor 2 (TALE family homeobox) (TGIF2, Accession NM_021809). Accordingly, utilities of VGAM1376 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TGIF2. LOC145098 (Accession XM_085022) is another VGAM1376 host target gene. LOC145098 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145098, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145098 BINDING SITE, designated SEQ ID:37796, to

the nucleotide sequence of VGAM1376 RNA, herein designated VGAM RNA, also designated SEQ ID:4087.

[48344] Another function of VGAM1376 is therefore inhibition of LOC145098 (Accession XM_085022). Accordingly, utilities of VGAM1376 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145098. LOC145719 (Accession XM_096848) is another VGAM1376 host target gene. LOC145719 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145719, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145719 BINDING SITE, designated SEQ ID:40572, to the nucleotide sequence of VGAM1376 RNA, herein designated VGAM RNA, also designated SEQ ID:4087.

[48345] Another function of VGAM1376 is therefore inhibition of LOC145719 (Accession XM_096848). Accordingly, utilities of VGAM1376 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145719. LOC145720 (Accession XM_096846) is another VGAM1376 host target gene. LOC145720 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC145720, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145720 BINDING SITE, designated SEQ ID:40562, to the nucleotide sequence of VGAM1376 RNA, herein designated VGAM RNA, also designated SEQ ID:4087.

[48346] Another function of VGAM1376 is therefore inhibition of LOC145720 (Accession XM_096846). Accordingly, utilities of VGAM1376 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145720. LOC155382 (Accession XM_098713) is another VGAM1376 host target gene. LOC155382 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC155382, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155382 BINDING SITE, designated SEQ ID:41764, to the nucleotide sequence of VGAM1376 RNA, herein designated VGAM RNA, also designated SEQ ID:4087.

[48347] Another function of VGAM1376 is therefore inhibition of LOC155382 (Accession XM_098713). Accordingly, utilities

of VGAM1376 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155382. LOC197114 (Accession XM_116987) is another VGAM1376 host target gene. LOC197114 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC197114, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197114 BINDING SITE, designated SEQ ID:43186, to the nucleotide sequence of VGAM1376 RNA, herein designated VGAM RNA, also designated SEQ ID:4087.

[48348] Another function of VGAM1376 is therefore inhibition of LOC197114 (Accession XM_116987). Accordingly, utilities of VGAM1376 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197114. LOC254013 (Accession XM_170700) is another VGAM1376 host target gene. LOC254013 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC254013, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC254013 BINDING SITE, designated SEQ ID:45479, to the nucleotide sequence of VGAM1376 RNA, herein designated VGAM RNA, also designated SEQ ID:4087.

[48349] Another function of VGAM1376 is therefore inhibition of LOC254013 (Accession XM_170700). Accordingly, utilities of VGAM1376 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254013. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1377 (VGAM1377) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48350] VGAM1377 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1377 was detected is described hereinabove with reference to Figs. 1–8.

[48351] VGAM1377 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine Herpesvirus 1. VGAM1377 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48352] VGAM1377 gene encodes a VGAM1377 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1377 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1377 precursor RNA is designated SEQ ID:1363, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1363 is located at position 27042 relative to the genome of Alcelaphine Herpesvirus 1.

[48353] VGAM1377 precursor RNA folds onto itself, forming VGAM1377 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48354] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1377 folded precursor RNA into VGAM1377 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1377 RNA is designated SEQ ID:4088, and is provided hereinbelow with reference to the sequence listing part.

[48355] VGAM1377 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1377 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1377 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[48356] VGAM1377 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1377 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1377 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1377 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1377 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[48357] The complementary binding of VGAM1377 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1377 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1377 host target RNA into VGAM1377 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48358] It is appreciated that VGAM1377 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1377 host target genes. The mRNA of each one of this plurality of VGAM1377 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1377 RNA, herein designated VGAM RNA, and which when bound by VGAM1377 RNA causes inhibition of translation of respective one or more VGAM1377 host target proteins.

[48359] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1377 gene, herein designated VGAM GENE, on one or more VGAM1377 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,
`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[48360] It is yet further appreciated that a function of VGAM1377 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1377 include diagnosis, prevention and treatment of viral infection by Alcelaphine Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1377 correlate with, and may be deduced from, the identity of the host target genes which VGAM1377 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48361] Nucleotide sequences of the VGAM1377 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1377 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1377 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1377 are further described hereinbelow with reference to Table 1.

[48362] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1377 host target RNA, and

schematic representation of the complementarity of each of these host target binding sites to VGAM1377 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48363] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1377 gene, herein designated VGAM is inhibition of expression of VGAM1377 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1377 correlate with, and may be deduced from, the identity of the target genes which VGAM1377 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[48364] Coronin, Actin Binding Protein, 2A (CORO2A, Accession NM_003389) is a VGAM1377 host target gene. CORO2A BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CORO2A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CORO2A BINDING SITE, designated SEQ ID:9426, to the nucleotide sequence of VGAM1377 RNA, herein designated VGAM RNA, also designated SEQ ID:4088.

[48365] A function of VGAM1377 is therefore inhibition of Coronin, Actin Binding Protein, 2A (CORO2A, Accession NM_003389). Accordingly, utilities of VGAM1377 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CORO2A. Family with Sequence Similarity 8, Member A1 (FAM8A1, Accession NM_016255) is another VGAM1377 host target gene. FAM8A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FAM8A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FAM8A1 BINDING SITE, designated SEQ ID:18383, to the nucleotide sequence of VGAM1377 RNA, herein designated VGAM RNA, also designated SEQ ID:4088.

[48366] Another function of VGAM1377 is therefore inhibition of Family with Sequence Similarity 8, Member A1 (FAM8A1, Accession NM_016255). Accordingly, utilities of VGAM1377 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FAM8A1. FLJ22843 (Accession NM_025184) is another VGAM1377 host target gene. FLJ22843 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22843, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22843 BINDING SITE, designated SEQ ID:24821, to the nucleotide sequence of VGAM1377 RNA, herein designated VGAM RNA, also designated SEQ ID:4088.

[48367] Another function of VGAM1377 is therefore inhibition of FLJ22843 (Accession NM_025184). Accordingly, utilities of VGAM1377 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22843. LOC200310 (Accession XM_037840) is another VGAM1377 host target gene. LOC200310 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200310, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200310 BINDING SITE, designated SEQ ID:32707, to the nucleotide sequence of VGAM1377 RNA, herein designated VGAM RNA, also designated SEQ ID:4088.

[48368] Another function of VGAM1377 is therefore inhibition of

LOC200310 (Accession XM_037840). Accordingly, utilities of VGAM1377 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200310. LOC90625 (Accession XM_033004) is another VGAM1377 host target gene. LOC90625 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90625, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90625 BINDING SITE, designated SEQ ID:31820, to the nucleotide sequence of VGAM1377 RNA, herein designated VGAM RNA, also designated SEQ ID:4088.

[48369] Another function of VGAM1377 is therefore inhibition of LOC90625 (Accession XM_033004). Accordingly, utilities of VGAM1377 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90625. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1378 (VGAM1378) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[48370] VGAM1378 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1378 was detected is described hereinabove with reference to Figs. 1–8.

[48371] VGAM1378 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 1. VGAM1378 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48372] VGAM1378 gene encodes a VGAM1378 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1378 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1378 precursor RNA is designated SEQ ID:1364, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1364 is located at position 141854 relative to the genome of Human Herpesvirus 1.

[48373] VGAM1378 precursor RNA folds onto itself, forming VGAM1378 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two–

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48374] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1378 folded precursor RNA into VGAM1378 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1378 RNA is designated SEQ ID:4089, and is provided hereinbelow with reference to the sequence listing part.

[48375] VGAM1378 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1378 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1378 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[48376] VGAM1378 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1378 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1378 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1378 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1378 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[48377] The complementary binding of VGAM1378 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1378 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1378 host target RNA into VGAM1378 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48378] It is appreciated that VGAM1378 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1378 host target genes. The mRNA of each one of this plurality of VGAM1378 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1378 RNA, herein designated VGAM RNA, and which when bound by VGAM1378 RNA causes inhibition of translation of respective one or more VGAM1378 host target proteins.

[48379] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1378 gene, herein designated VGAM GENE, on one

or more VGAM1378 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[48380] It is yet further appreciated that a function of VGAM1378 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1378 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1378 correlate with, and may be deduced from, the identity of the host target genes which VGAM1378 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48381] Nucleotide sequences of the VGAM1378 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1378 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1378 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1378 are further described hereinbelow with reference to Table 1.

[48382] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1378 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1378 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48383] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1378 gene, herein designated VGAM is inhibition of expression of VGAM1378 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1378 correlate with, and may be deduced from, the identity of the target genes which VGAM1378 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[48384] Axin 1 (AXIN1, Accession XM_027520) is a VGAM1378

host target gene. AXIN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AXIN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AXIN1 BINDING SITE, designated SEQ ID:30517, to the nucleotide sequence of VGAM1378 RNA, herein designated VGAM RNA, also designated SEQ ID:4089.

[48385] A function of VGAM1378 is therefore inhibition of Axin 1 (AXIN1, Accession XM_027520). Accordingly, utilities of VGAM1378 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AXIN1. Calbindin 1, 28kDa (CALB1, Accession NM_004929) is another VGAM1378 host target gene. CALB1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CALB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CALB1 BINDING SITE, designated SEQ ID:11368, to the nucleotide sequence of VGAM1378 RNA, herein designated VGAM RNA, also designated SEQ ID:4089.

[48386] Another function of VGAM1378 is therefore inhibition of Calbindin 1, 28kDa (CALB1, Accession NM_004929), a gene which buffers cytosolic calcium. Accordingly, utilities of VGAM1378 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CALB1. The function of CALB1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM266. Clathrin, Heavy Polypeptide-like 1 (CLTCL1, Accession XM_033096) is another VGAM1378 host target gene. CLTCL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLTCL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLTCL1 BINDING SITE, designated SEQ ID:31834, to the nucleotide sequence of VGAM1378 RNA, herein designated VGAM RNA, also designated SEQ ID:4089.

[48387] Another function of VGAM1378 is therefore inhibition of Clathrin, Heavy Polypeptide-like 1 (CLTCL1, Accession XM_033096), a gene which is involved in vesicle budding. Accordingly, utilities of VGAM1378 include diagnosis,

prevention and treatment of diseases and clinical conditions associated with CLTCL1. The function of CLTCL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM42. EGF-like-domain, Multiple 4 (EGFL4, Accession XM_029883) is another VGAM1378 host target gene.

EGFL4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by EGFL4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGFL4 BINDING SITE, designated SEQ ID:30961, to the nucleotide sequence of VGAM1378 RNA, herein designated VGAM RNA, also designated SEQ ID:4089.

[48388] Another function of VGAM1378 is therefore inhibition of EGF-like-domain, Multiple 4 (EGFL4, Accession XM_029883). Accordingly, utilities of VGAM1378 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGFL4. Exostoses (multiple)-like 3 (EXTL3, Accession NM_001440) is another VGAM1378 host target gene. EXTL3 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EXTL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EXTL3 BINDING SITE, designated SEQ ID:7169, to the nucleotide sequence of VGAM1378 RNA, herein designated VGAM RNA, also designated SEQ ID:4089.

[48389] Another function of VGAM1378 is therefore inhibition of Exostoses (multiple)-like 3 (EXTL3, Accession NM_001440), a gene which is a member of the multiple exostoses gene family. Accordingly, utilities of VGAM1378 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EXTL3. The function of EXTL3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM95. Low Density Lipoprotein-related Protein 1 (alpha-2-macroglobulin receptor) (LRP1, Accession NM_002332) is another VGAM1378 host target gene. LRP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LRP1, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LRP1 BINDING SITE, designated SEQ ID:8138, to the nucleotide sequence of VGAM1378 RNA, herein designated VGAM RNA, also designated SEQ ID:4089.

[48390] Another function of VGAM1378 is therefore inhibition of Low Density Lipoprotein-related Protein 1 (alpha-2-macroglobulin receptor) (LRP1, Accession NM_002332), a gene which is a recycling lipoprotein receptor with possible growth-modulating effects. Accordingly, utilities of VGAM1378 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LRP1. The function of LRP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM885. Protein Kinase C and Casein Kinase Substrate In Neurons 1 (PACSIN1, Accession XM_166424) is another VGAM1378 host target gene. PACSIN1 BINDING SITE1 and PACSIN1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PACSIN1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementar-

ity of the nucleotide sequences of PACSIN1 BINDING SITE1 and PACSIN1 BINDING SITE2, designated SEQ ID:44312 and SEQ ID:44313 respectively, to the nucleotide sequence of VGAM1378 RNA, herein designated VGAM RNA, also designated SEQ ID:4089.

[48391] Another function of VGAM1378 is therefore inhibition of Protein Kinase C and Casein Kinase Substrate In Neurons 1 (PACSIN1, Accession XM_166424). Accordingly, utilities of VGAM1378 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PACSIN1. FLJ14124 (Accession NM_024868) is another VGAM1378 host target gene. FLJ14124 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14124, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14124 BINDING SITE, designated SEQ ID:24303, to the nucleotide sequence of VGAM1378 RNA, herein designated VGAM RNA, also designated SEQ ID:4089.

[48392] Another function of VGAM1378 is therefore inhibition of FLJ14124 (Accession NM_024868). Accordingly, utilities of VGAM1378 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ14124. FLJ20413 (Accession NM_017808) is another VGAM1378 host target gene. FLJ20413 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20413, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20413 BINDING SITE, designated SEQ ID:19451, to the nucleotide sequence of VGAM1378 RNA, herein designated VGAM RNA, also designated SEQ ID:4089.

[48393] Another function of VGAM1378 is therefore inhibition of FLJ20413 (Accession NM_017808). Accordingly, utilities of VGAM1378 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20413. IL-17RC (Accession NM_032732) is another VGAM1378 host target gene. IL-17RC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL-17RC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL-17RC BINDING SITE, designated SEQ ID:26455, to the nucleotide

sequence of VGAM1378 RNA, herein designated VGAM RNA, also designated SEQ ID:4089.

[48394] Another function of VGAM1378 is therefore inhibition of IL-17RC (Accession NM_032732). Accordingly, utilities of VGAM1378 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL-17RC. KIAA0876 (Accession XM_035625) is another VGAM1378 host target gene. KIAA0876 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0876, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0876 BINDING SITE, designated SEQ ID:32293, to the nucleotide sequence of VGAM1378 RNA, herein designated VGAM RNA, also designated SEQ ID:4089.

[48395] Another function of VGAM1378 is therefore inhibition of KIAA0876 (Accession XM_035625). Accordingly, utilities of VGAM1378 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0876. KIAA1576 (Accession XM_038186) is another VGAM1378 host target gene. KIAA1576 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA1576, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1576 BINDING SITE, designated SEQ ID:32774, to the nucleotide sequence of VGAM1378 RNA, herein designated VGAM RNA, also designated SEQ ID:4089.

[48396] Another function of VGAM1378 is therefore inhibition of KIAA1576 (Accession XM_038186). Accordingly, utilities of VGAM1378 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1576. PP1201 (Accession NM_022152) is another VGAM1378 host target gene. PP1201 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PP1201, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PP1201 BINDING SITE, designated SEQ ID:22711, to the nucleotide sequence of VGAM1378 RNA, herein designated VGAM RNA, also designated SEQ ID:4089.

[48397] Another function of VGAM1378 is therefore inhibition of PP1201 (Accession NM_022152). Accordingly, utilities of

VGAM1378 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PP1201. WD Repeat Domain 7 (WDR7, Accession NM_015285) is another VGAM1378 host target gene. WDR7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by WDR7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WDR7 BINDING SITE, designated SEQ ID:17608, to the nucleotide sequence of VGAM1378 RNA, herein designated VGAM RNA, also designated SEQ ID:4089.

[48398] Another function of VGAM1378 is therefore inhibition of WD Repeat Domain 7 (WDR7, Accession NM_015285). Accordingly, utilities of VGAM1378 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WDR7. LOC149076 (Accession XM_086415) is another VGAM1378 host target gene. LOC149076 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149076, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of LOC149076 BINDING SITE, designated SEQ ID:38637, to the nucleotide sequence of VGAM1378 RNA, herein designated VGAM RNA, also designated SEQ ID:4089.

[48399] Another function of VGAM1378 is therefore inhibition of LOC149076 (Accession XM_086415). Accordingly, utilities of VGAM1378 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149076. LOC199920 (Accession XM_114056) is another VGAM1378 host target gene. LOC199920 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC199920, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199920 BINDING SITE, designated SEQ ID:42661, to the nucleotide sequence of VGAM1378 RNA, herein designated VGAM RNA, also designated SEQ ID:4089.

[48400] Another function of VGAM1378 is therefore inhibition of LOC199920 (Accession XM_114056). Accordingly, utilities of VGAM1378 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199920. LOC200470 (Accession XM_117235) is an-

other VGAM1378 host target gene. LOC200470 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC200470, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200470 BINDING SITE, designated SEQ ID:43307, to the nucleotide sequence of VGAM1378 RNA, herein designated VGAM RNA, also designated SEQ ID:4089.

[48401] Another function of VGAM1378 is therefore inhibition of LOC200470 (Accession XM_117235). Accordingly, utilities of VGAM1378 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200470. LOC220097 (Accession XM_167887) is another VGAM1378 host target gene. LOC220097 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220097, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220097 BINDING SITE, designated SEQ ID:44896, to the nucleotide sequence of VGAM1378 RNA, herein designated VGAM RNA, also designated SEQ ID:4089.

[48402] Another function of VGAM1378 is therefore inhibition of LOC220097 (Accession XM_167887). Accordingly, utilities of VGAM1378 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220097. LOC222031 (Accession XM_168371) is another VGAM1378 host target gene. LOC222031 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC222031, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222031 BINDING SITE, designated SEQ ID:45135, to the nucleotide sequence of VGAM1378 RNA, herein designated VGAM RNA, also designated SEQ ID:4089.

[48403] Another function of VGAM1378 is therefore inhibition of LOC222031 (Accession XM_168371). Accordingly, utilities of VGAM1378 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222031. LOC90979 (Accession XM_035323) is another VGAM1378 host target gene. LOC90979 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90979, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90979 BINDING SITE, designated SEQ ID:32231, to the nucleotide sequence of VGAM1378 RNA, herein designated VGAM RNA, also designated SEQ ID:4089.

[48404] Another function of VGAM1378 is therefore inhibition of LOC90979 (Accession XM_035323). Accordingly, utilities of VGAM1378 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90979. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1379 (VGAM1379) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48405] VGAM1379 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1379 was detected is described hereinabove with reference to Figs. 1-8.

[48406] VGAM1379 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 1. VGAM1379 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[48407] VGAM1379 gene encodes a VGAM1379 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1379 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1379 precursor RNA is designated SEQ ID:1365, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1365 is located at position 142746 relative to the genome of Human Herpesvirus 1.

[48408] VGAM1379 precursor RNA folds onto itself, forming VGAM1379 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48409] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1379 folded precursor RNA into VGAM1379

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1379 RNA is designated SEQ ID:4090, and is provided hereinbelow with reference to the sequence listing part.

[48410] VGAM1379 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1379 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1379 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[48411] VGAM1379 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1379 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1379 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1379 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1379 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[48412] The complementary binding of VGAM1379 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1379 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1379 host target RNA into VGAM1379 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[48413] It is appreciated that VGAM1379 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1379 host target genes. The mRNA of each one of this plurality of VGAM1379 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1379 RNA, herein designated VGAM RNA, and which when bound by VGAM1379 RNA causes inhibition of translation of respective one or more VGAM1379 host target proteins.

[48414] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1379 gene, herein designated VGAM GENE, on one or more VGAM1379 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[48415] It is yet further appreciated that a function of VGAM1379 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1379 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1379 correlate with, and may be deduced from, the identity of the host target genes which VGAM1379 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48416] Nucleotide sequences of the VGAM1379 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1379 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1379 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1379 are further described hereinbelow with reference to Table 1.

[48417] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1379 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1379 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48418] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1379 gene, herein designated VGAM is inhibition of expression of VGAM1379 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1379 correlate with, and may be deduced from, the identity of the target genes which VGAM1379 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[48419] KIAA1322 (Accession XM_052626) is a VGAM1379 host target gene. KIAA1322 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1322, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1322 BINDING SITE, designated SEQ ID:36025, to the nucleotide sequence of VGAM1379 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4090.

[48420] A function of VGAM1379 is therefore inhibition of KIAA1322 (Accession XM_052626). Accordingly, utilities of VGAM1379 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1322. TIP120B (Accession XM_051590) is another VGAM1379 host target gene. TIP120B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TIP120B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIP120B BINDING SITE, designated SEQ ID:35859, to the nucleotide sequence of VGAM1379 RNA, herein designated VGAM RNA, also designated SEQ ID:4090.

[48421] Another function of VGAM1379 is therefore inhibition of TIP120B (Accession XM_051590). Accordingly, utilities of VGAM1379 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIP120B. LOC120448 (Accession XM_062032) is another VGAM1379 host target gene. LOC120448 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC120448, corresponding

to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC120448 BINDING SITE, designated SEQ ID:37222, to the nucleotide sequence of VGAM1379 RNA, herein designated VGAM RNA, also designated SEQ ID:4090.

[48422] Another function of VGAM1379 is therefore inhibition of LOC120448 (Accession XM_062032). Accordingly, utilities of VGAM1379 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC120448. LOC256158 (Accession XM_175125) is another VGAM1379 host target gene. LOC256158 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256158, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256158 BINDING SITE, designated SEQ ID:46627, to the nucleotide sequence of VGAM1379 RNA, herein designated VGAM RNA, also designated SEQ ID:4090.

[48423] Another function of VGAM1379 is therefore inhibition of LOC256158 (Accession XM_175125). Accordingly, utilities of VGAM1379 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC256158. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1380 (VGAM1380) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48424] VGAM1380 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1380 was detected is described hereinabove with reference to Figs. 1–8.

[48425] VGAM1380 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Himetobi P Virus. VGAM1380 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48426] VGAM1380 gene encodes a VGAM1380 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1380 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1380 precursor RNA is desig-

nated SEQ ID:1366, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1366 is located at position 2325 relative to the genome of Himetobi P Virus.

- [48427] VGAM1380 precursor RNA folds onto itself, forming VGAM1380 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [48428] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1380 folded precursor RNA into VGAM1380 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1380 RNA is designated SEQ ID:4091, and is provided hereinbelow with reference to the sequence

listing part.

[48429] VGAM1380 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1380 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1380 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[48430] VGAM1380 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1380 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1380 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1380 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM1380 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[48431] The complementary binding of VGAM1380 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1380 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1380 host target RNA into VGAM1380 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48432] It is appreciated that VGAM1380 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1380 host target genes. The mRNA of each one of this plurality of VGAM1380 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1380 RNA, herein designated VGAM

RNA, and which when bound by VGAM1380 RNA causes inhibition of translation of respective one or more VGAM1380 host target proteins.

[48433] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1380 gene, herein designated VGAM GENE, on one or more VGAM1380 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[48434] It is yet further appreciated that a function of VGAM1380 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1380 include diagnosis, prevention and treatment of viral infection by Himetobi P Virus. Specific functions, and accordingly utilities, of VGAM1380 correlate with, and may be deduced from, the identity of the host target genes which VGAM1380 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48435] Nucleotide sequences of the VGAM1380 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1380 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1380 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1380 are further described hereinbelow with reference to Table 1.

[48436] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1380 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1380 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48437] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1380 gene, herein designated VGAM is

inhibition of expression of VGAM1380 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1380 correlate with, and may be deduced from, the identity of the target genes which VGAM1380 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[48438] FENS-1 (Accession NM_020830) is a VGAM1380 host target gene. FENS-1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FENS-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FENS-1 BINDING SITE, designated SEQ ID:21894, to the nucleotide sequence of VGAM1380 RNA, herein designated VGAM RNA, also designated SEQ ID:4091.

[48439] A function of VGAM1380 is therefore inhibition of FENS-1 (Accession NM_020830). Accordingly, utilities of VGAM1380 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FENS-1. PRO0902 (Accession NM_053057) is another VGAM1380 host target gene. PRO0902 BINDING SITE is HOST TARGET binding site found in the 5' untranslated

region of mRNA encoded by PRO0902, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0902 BINDING SITE, designated SEQ ID:27604, to the nucleotide sequence of VGAM1380 RNA, herein designated VGAM RNA, also designated SEQ ID:4091.

[48440] Another function of VGAM1380 is therefore inhibition of PRO0902 (Accession NM_053057). Accordingly, utilities of VGAM1380 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0902. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1381 (VGAM1381) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48441] VGAM1381 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1381 was detected is described hereinabove with reference to Figs. 1-8.

[48442] VGAM1381 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Himetobi P Virus.

VGAM1381 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48443] VGAM1381 gene encodes a VGAM1381 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1381 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1381 precursor RNA is designated SEQ ID:1367, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1367 is located at position 8357 relative to the genome of Himetobi P Virus.

[48444] VGAM1381 precursor RNA folds onto itself, forming VGAM1381 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48445] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1381 folded precursor RNA into VGAM1381 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1381 RNA is designated SEQ ID:4092, and is provided hereinbelow with reference to the sequence listing part.

[48446] VGAM1381 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1381 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1381 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[48447] VGAM1381 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1381 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1381 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1381 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1381 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[48448] The complementary binding of VGAM1381 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1381 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1381

host target RNA into VGAM1381 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48449] It is appreciated that VGAM1381 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1381 host target genes. The mRNA of each one of this plurality of VGAM1381 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1381 RNA, herein designated VGAM RNA, and which when bound by VGAM1381 RNA causes inhibition of translation of respective one or more VGAM1381 host target proteins.

[48450] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1381 gene, herein designated VGAM GENE, on one or more VGAM1381 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[48451] It is yet further appreciated that a function of VGAM1381 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1381 include diagnosis, prevention and treatment of viral infection by Himetobi P Virus. Specific functions, and accordingly utilities, of VGAM1381 correlate with, and may be deduced from, the identity of the host target genes which VGAM1381 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48452] Nucleotide sequences of the VGAM1381 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1381 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1381 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1381 are further

described hereinbelow with reference to Table 1.

[48453] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1381 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1381 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48454] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1381 gene, herein designated VGAM is inhibition of expression of VGAM1381 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1381 correlate with, and may be deduced from, the identity of the target genes which VGAM1381 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[48455] RAB1A, Member RAS Oncogene Family (RAB1A, Accession XM_046674) is a VGAM1381 host target gene. RAB1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAB1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of RAB1A BINDING SITE, designated SEQ ID:34786, to the nucleotide sequence of VGAM1381 RNA, herein designated VGAM RNA, also designated SEQ ID:4092.

[48456] A function of VGAM1381 is therefore inhibition of RAB1A, Member RAS Oncogene Family (RAB1A, Accession XM_046674), a gene which is involved in vesicle transport. Accordingly, utilities of VGAM1381 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB1A. The function of RAB1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM433.KIAA0367 (Accession XM_041018) is another VGAM1381 host target gene. KIAA0367 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0367, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0367 BINDING SITE, designated SEQ ID:33422, to the nucleotide sequence of VGAM1381 RNA, herein designated VGAM RNA, also designated SEQ ID:4092.

[48457] Another function of VGAM1381 is therefore inhibition of

KIAA0367 (Accession XM_041018). Accordingly, utilities of VGAM1381 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0367. KIAA1030 (Accession XM_167789) is another VGAM1381 host target gene. KIAA1030 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1030, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1030 BINDING SITE, designated SEQ ID:44816, to the nucleotide sequence of VGAM1381 RNA, herein designated VGAM RNA, also designated SEQ ID:4092.

[48458] Another function of VGAM1381 is therefore inhibition of KIAA1030 (Accession XM_167789). Accordingly, utilities of VGAM1381 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1030. LOC162239 (Accession XM_091439) is another VGAM1381 host target gene. LOC162239 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC162239, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC162239 BINDING SITE, designated SEQ ID:40050, to the nucleotide sequence of VGAM1381 RNA, herein designated VGAM RNA, also designated SEQ ID:4092.

[48459] Another function of VGAM1381 is therefore inhibition of LOC162239 (Accession XM_091439). Accordingly, utilities of VGAM1381 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC162239. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1382 (VGAM1382) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48460] VGAM1382 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1382 was detected is described hereinabove with reference to Figs. 1–8.

[48461] VGAM1382 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Himetobi P Virus. VGAM1382 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[48462] VGAM1382 gene encodes a VGAM1382 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1382 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1382 precursor RNA is designated SEQ ID:1368, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1368 is located at position 4080 relative to the genome of Himetobi P Virus.

[48463] VGAM1382 precursor RNA folds onto itself, forming VGAM1382 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48464] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1382 folded precursor RNA into VGAM1382 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM1382 RNA is designated SEQ ID:4093, and is provided hereinbelow with reference to the sequence listing part.

[48465] VGAM1382 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1382 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1382 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[48466] VGAM1382 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1382 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1382 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1382 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1382 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[48467] The complementary binding of VGAM1382 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1382 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1382 host target RNA into VGAM1382 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48468] It is appreciated that VGAM1382 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1382 host target genes. The mRNA of each one of this plurality of VGAM1382 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1382 RNA, herein designated VGAM RNA, and which when bound by VGAM1382 RNA causes inhibition of translation of respective one or more VGAM1382 host target proteins.

[48469] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1382 gene, herein designated VGAM GENE, on one or more VGAM1382 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[48470] It is yet further appreciated that a function of VGAM1382 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1382 include diagnosis, prevention and treatment of viral infection by Himetobi P Virus. Specific functions, and accordingly utilities, of VGAM1382 correlate with, and may be deduced from, the identity of the host target genes which VGAM1382 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48471] Nucleotide sequences of the VGAM1382 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1382 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1382 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1382 are further described hereinbelow with reference to Table 1.

[48472] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM1382 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1382 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48473] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1382 gene, herein designated VGAM is inhibition of expression of VGAM1382 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1382 correlate with, and may be deduced from, the identity of the target genes which VGAM1382 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[48474] Active BCR-related Gene (ABR, Accession NM_001092) is a VGAM1382 host target gene. ABR BINDING SITE1 and ABR BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ABR, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABR BINDING SITE1 and ABR BINDING SITE2, designated SEQ ID:6751 and SEQ ID:22496 respectively, to the nucleotide sequence of VGAM1382 RNA, herein designated

VGAM RNA, also designated SEQ ID:4093.

[48475] A function of VGAM1382 is therefore inhibition of Active BCR-related Gene (ABR, Accession NM_001092), a gene which gtpase-activating protein for rac and cdc42. Accordingly, utilities of VGAM1382 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABR. The function of ABR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM489. Cell Matrix Adhesion Regulator (CMAR, Accession NM_005200) is another VGAM1382 host target gene. CMAR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CMAR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CMAR BINDING SITE, designated SEQ ID:11699, to the nucleotide sequence of VGAM1382 RNA, herein designated VGAM RNA, also designated SEQ ID:4093.

[48476] Another function of VGAM1382 is therefore inhibition of Cell Matrix Adhesion Regulator (CMAR, Accession NM_005200). Accordingly, utilities of VGAM1382 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with CMAR. Cannabinoid Receptor 1 (brain) (CNR1, Accession NM_016083) is another VGAM1382 host target gene. CNR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CNR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNR1 BINDING SITE, designated SEQ ID:18163, to the nucleotide sequence of VGAM1382 RNA, herein designated VGAM RNA, also designated SEQ ID:4093.

[48477] Another function of VGAM1382 is therefore inhibition of Cannabinoid Receptor 1 (brain) (CNR1, Accession NM_016083), a gene which is involved in the cannabinoid-induced CNS effects. Accordingly, utilities of VGAM1382 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNR1. The function of CNR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM533. Cysteine-rich Motor Neuron 1 (CRIM1, Accession NM_016441) is another VGAM1382 host target

gene. CRIM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CRIM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRIM1 BINDING SITE, designated SEQ ID:18562, to the nucleotide sequence of VGAM1382 RNA, herein designated VGAM RNA, also designated SEQ ID:4093.

[48478] Another function of VGAM1382 is therefore inhibition of Cysteine-rich Motor Neuron 1 (CRIM1, Accession NM_016441). Accordingly, utilities of VGAM1382 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRIM1. Protocadherin Alpha 1 (PCDHA1, Accession NM_031411) is another VGAM1382 host target gene. PCDHA1 BINDING SITE1 and PCDHA1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PCDHA1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA1 BINDING SITE1 and PCDHA1 BINDING SITE2, designated SEQ ID:25384 and SEQ ID:20865 respectively,

to the nucleotide sequence of VGAM1382 RNA, herein designated VGAM RNA, also designated SEQ ID:4093.

[48479] Another function of VGAM1382 is therefore inhibition of Protocadherin Alpha 1 (PCDHA1, Accession NM_031411). Accordingly, utilities of VGAM1382 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA1. Protocadherin Alpha 10 (PCDHA10, Accession NM_031860) is another VGAM1382 host target gene. PCDHA10 BINDING SITE1 and PCDHA10 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PCDHA10, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA10 BINDING SITE1 and PCDHA10 BINDING SITE2, designated SEQ ID:25616 and SEQ ID:20885 respectively, to the nucleotide sequence of VGAM1382 RNA, herein designated VGAM RNA, also designated SEQ ID:4093.

[48480] Another function of VGAM1382 is therefore inhibition of Protocadherin Alpha 10 (PCDHA10, Accession NM_031860). Accordingly, utilities of VGAM1382 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA10. Protocadherin

Alpha 13 (PCDHA13, Accession NM_018904) is another VGAM1382 host target gene. PCDHA13 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHA13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA13 BINDING SITE, designated SEQ ID:20906, to the nucleotide sequence of VGAM1382 RNA, herein designated VGAM RNA, also designated SEQ ID:4093.

[48481] Another function of VGAM1382 is therefore inhibition of Protocadherin Alpha 13 (PCDHA13, Accession NM_018904). Accordingly, utilities of VGAM1382 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA13. Protocadherin Alpha 2 (PCDHA2, Accession NM_018905) is another VGAM1382 host target gene. PCDHA2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA2 BINDING SITE, designated SEQ ID:20916, to the nucleotide

sequence of VGAM1382 RNA, herein designated VGAM RNA, also designated SEQ ID:4093.

[48482] Another function of VGAM1382 is therefore inhibition of Protocadherin Alpha 2 (PCDHA2, Accession NM_018905). Accordingly, utilities of VGAM1382 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA2. Protocadherin Alpha 3 (PCDHA3, Accession NM_018906) is another VGAM1382 host target gene. PCDHA3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA3 BINDING SITE, designated SEQ ID:20926, to the nucleotide sequence of VGAM1382 RNA, herein designated VGAM RNA, also designated SEQ ID:4093.

[48483] Another function of VGAM1382 is therefore inhibition of Protocadherin Alpha 3 (PCDHA3, Accession NM_018906). Accordingly, utilities of VGAM1382 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA3. Protocadherin Alpha 4 (PCDHA4, Accession NM_018907) is another VGAM1382

host target gene. PCDHA4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA4 BINDING SITE, designated SEQ ID:20936, to the nucleotide sequence of VGAM1382 RNA, herein designated VGAM RNA, also designated SEQ ID:4093.

[48484] Another function of VGAM1382 is therefore inhibition of Protocadherin Alpha 4 (PCDHA4, Accession NM_018907). Accordingly, utilities of VGAM1382 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA4. Protocadherin Alpha 5 (PCDHA5, Accession NM_018908) is another VGAM1382 host target gene. PCDHA5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHA5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA5 BINDING SITE, designated SEQ ID:20946, to the nucleotide sequence of VGAM1382 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4093.

[48485] Another function of VGAM1382 is therefore inhibition of Protocadherin Alpha 5 (PCDHA5, Accession NM_018908). Accordingly, utilities of VGAM1382 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA5. Protocadherin Alpha 6 (PCDHA6, Accession NM_018909) is another VGAM1382 host target gene. PCDHA6 BINDING SITE1 and PCDHA6 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PCDHA6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA6 BINDING SITE1 and PCDHA6 BINDING SITE2, designated SEQ ID:20956 and SEQ ID:25588 respectively, to the nucleotide sequence of VGAM1382 RNA, herein designated VGAM RNA, also designated SEQ ID:4093.

[48486] Another function of VGAM1382 is therefore inhibition of Protocadherin Alpha 6 (PCDHA6, Accession NM_018909). Accordingly, utilities of VGAM1382 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA6. Protocadherin Alpha 8 (PCDHA8, Accession NM_018911) is another VGAM1382

host target gene. PCDHA8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PCDHA8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA8 BINDING SITE, designated SEQ ID:20976, to the nucleotide sequence of VGAM1382 RNA, herein designated VGAM RNA, also designated SEQ ID:4093.

[48487] Another function of VGAM1382 is therefore inhibition of Protocadherin Alpha 8 (PCDHA8, Accession NM_018911). Accordingly, utilities of VGAM1382 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA8. Protocadherin Alpha 9 (PCDHA9, Accession NM_031857) is another VGAM1382 host target gene. PCDHA9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PCDHA9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA9 BINDING SITE, designated SEQ ID:25601, to the nucleotide sequence of VGAM1382 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4093.

[48488] Another function of VGAM1382 is therefore inhibition of Protocadherin Alpha 9 (PCDHA9, Accession NM_031857), a gene which is a calcium-dependent cell-adhesion protein. Accordingly, utilities of VGAM1382 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA9. The function of PCDHA9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM71. Protocadherin Alpha Subfamily C, 1 (PCDHAC1, Accession NM_018898) is another VGAM1382 host target gene. PCDHAC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHAC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHAC1 BINDING SITE, designated SEQ ID:20845, to the nucleotide sequence of VGAM1382 RNA, herein designated VGAM RNA, also designated SEQ ID:4093.

[48489] Another function of VGAM1382 is therefore inhibition of Protocadherin Alpha Subfamily C, 1 (PCDHAC1, Accession

NM_018898). Accordingly, utilities of VGAM1382 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHAC1. Protocadherin Alpha Subfamily C, 2 (PCDHAC2, Accession NM_018899) is another VGAM1382 host target gene. PCDHAC2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHAC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHAC2 BINDING SITE, designated SEQ ID:20855, to the nucleotide sequence of VGAM1382 RNA, herein designated VGAM RNA, also designated SEQ ID:4093.

[48490] Another function of VGAM1382 is therefore inhibition of Protocadherin Alpha Subfamily C, 2 (PCDHAC2, Accession NM_018899). Accordingly, utilities of VGAM1382 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHAC2. Phosphorylase, Glycogen; Muscle (McArdle syndrome, glycogen storage disease type V) (PYGM, Accession NM_005609) is another VGAM1382 host target gene. PYGM BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PYGM, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PYGM BINDING SITE, designated SEQ ID:12128, to the nucleotide sequence of VGAM1382 RNA, herein designated VGAM RNA, also designated SEQ ID:4093.

[48491] Another function of VGAM1382 is therefore inhibition of Phosphorylase, Glycogen; Muscle (McArdle syndrome, glycogen storage disease type V) (PYGM, Accession NM_005609). Accordingly, utilities of VGAM1382 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PYGM. Spastic Paraplegia 7, Paraplegin (pure and complicated autosomal recessive) (SPG7, Accession NM_003119) is another VGAM1382 host target gene. SPG7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SPG7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPG7 BINDING SITE, designated SEQ ID:9090, to the nucleotide sequence of VGAM1382 RNA, herein designated VGAM RNA, also designated SEQ ID:4093.

[48492] Another function of VGAM1382 is therefore inhibition of

Spastic Paraplegia 7, Paraplegin (pure and complicated autosomal recessive) (SPG7, Accession NM_003119), a gene which act as an atp-dependent zinc metallopeptidase. involved in the degradation of sigma-32. Accordingly, utilities of VGAM1382 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPG7. The function of SPG7 has been established by previous studies. Casari et al. (1998) determined that paraplegin is highly homologous to the yeast mitochondrial ATPases AFG3, RCA1, and YME1, which have both proteolytic and chaperone-like activities at the inner mitochondrial membrane. Immunofluorescence analysis and import experiments showed that paraplegin localizes to mitochondria. Analysis of muscle biopsies from 2 patients with paraplegin mutations showed typical signs of mitochondrial OXPHOS defects, thus suggesting a mechanism for neurodegeneration in SPG-type disorders. Based on linkage analysis of a family with autosomal recessive spastic paraplegia that mapped to 16q24.3 (SPG7; 607259), Casari et al. (1998) used an EST clone to screen a human cDNA library and isolate a candidate gene. The full-length cDNA sequence corresponding to this gene encoded a deduced 795-amino acid protein, which they

named paraplegin. Northern blot analysis detected a transcript of approximately 3.2 kb in all fetal and adult tissues tested. Two additional hybridizing transcripts of approximately 2.6 and 7.5 kb were detected in heart and pancreas

[48493] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[48494] Casari, G.; De Fusco, M.; Ciarmatori, S.; Zeviani, M.; Mora, M.; Fernandez, P.; De Michele, G.; Filla, A.; Coccozza, S.; Marconi, R.; Durr, A.; Fontaine, B.; Ballabio, A. : Spastic paraplegia and OXPHOS impairment caused by mutations in paraplegin, a nuclear-encoded mitochondrial metalloprotease. Cell 93: 973–983, 1998. ; and

[48495] Casari, G.; De Fusco, M.; Ciarmatori, S.; Zeviani, M.; Mora, M.; Fernandez, P.; De Michele, G.; Filla, A.; Coccozza, S.; Marconi, R.; Durr, A.; Fontaine, B.; Ballabio, A. : Spastic paraplegi.

[48496] Further studies establishing the function and utilities of SPG7 are found in John Hopkins OMIM database record ID 602783, and in cited publications numbered 7660–7662 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Chemokine (C–C

motif) Receptor 6 (CCR6, Accession NM_031409) is another VGAM1382 host target gene. CCR6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CCR6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCR6 BINDING SITE, designated SEQ ID:25368, to the nucleotide sequence of VGAM1382 RNA, herein designated VGAM RNA, also designated SEQ ID:4093.

[48497] Another function of VGAM1382 is therefore inhibition of Chemokine (C-C motif) Receptor 6 (CCR6, Accession NM_031409). Accordingly, utilities of VGAM1382 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCR6. COAS3 (Accession NM_139020) is another VGAM1382 host target gene. COAS3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by COAS3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COAS3 BINDING SITE, designated SEQ ID:29118, to the nucleotide sequence of VGAM1382 RNA,

herein designated VGAM RNA, also designated SEQ ID:4093.

[48498] Another function of VGAM1382 is therefore inhibition of COAS3 (Accession NM_139020). Accordingly, utilities of VGAM1382 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COAS3. Complexin 1 (CPLX1, Accession NM_006651) is another VGAM1382 host target gene. CPLX1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CPLX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CPLX1 BINDING SITE, designated SEQ ID:13452, to the nucleotide sequence of VGAM1382 RNA, herein designated VGAM RNA, also designated SEQ ID:4093.

[48499] Another function of VGAM1382 is therefore inhibition of Complexin 1 (CPLX1, Accession NM_006651). Accordingly, utilities of VGAM1382 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CPLX1. DKFZP434L1435 (Accession XM_166401) is another VGAM1382 host target gene. DKFZP434L1435 BINDING SITE is HOST TARGET binding site found in the

5` untranslated region of mRNA encoded by DKFZP434L1435, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434L1435 BINDING SITE, designated SEQ ID:44266, to the nucleotide sequence of VGAM1382 RNA, herein designated VGAM RNA, also designated SEQ ID:4093.

[48500] Another function of VGAM1382 is therefore inhibition of DKFZP434L1435 (Accession XM_166401). Accordingly, utilities of VGAM1382 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434L1435. DnaJ (Hsp40) Homolog, Subfamily C, Member 5 (DNAJC5, Accession XM_028966) is another VGAM1382 host target gene. DNAJC5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DNAJC5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DNAJC5 BINDING SITE, designated SEQ ID:30815, to the nucleotide sequence of VGAM1382 RNA, herein designated VGAM RNA, also designated SEQ ID:4093.

[48501] Another function of VGAM1382 is therefore inhibition of DnaJ (Hsp40) Homolog, Subfamily C, Member 5 (DNAJC5, Accession XM_028966). Accordingly, utilities of VGAM1382 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNAJC5. FLJ12875 (Accession NM_024544) is another VGAM1382 host target gene. FLJ12875 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12875, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12875 BINDING SITE, designated SEQ ID:23754, to the nucleotide sequence of VGAM1382 RNA, herein designated VGAM RNA, also designated SEQ ID:4093.

[48502] Another function of VGAM1382 is therefore inhibition of FLJ12875 (Accession NM_024544). Accordingly, utilities of VGAM1382 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12875. FLJ13181 (Accession NM_025188) is another VGAM1382 host target gene. FLJ13181 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ13181, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13181 BINDING SITE, designated SEQ ID:24829, to the nucleotide sequence of VGAM1382 RNA, herein designated VGAM RNA, also designated SEQ ID:4093.

[48503] Another function of VGAM1382 is therefore inhibition of FLJ13181 (Accession NM_025188). Accordingly, utilities of VGAM1382 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13181. FLJ14564 (Accession XM_084459) is another VGAM1382 host target gene. FLJ14564 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14564, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14564 BINDING SITE, designated SEQ ID:37596, to the nucleotide sequence of VGAM1382 RNA, herein designated VGAM RNA, also designated SEQ ID:4093.

[48504] Another function of VGAM1382 is therefore inhibition of FLJ14564 (Accession XM_084459). Accordingly, utilities of VGAM1382 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ14564. FLJ14800 (Accession NM_032840) is another VGAM1382 host target gene. FLJ14800 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14800, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14800 BINDING SITE, designated SEQ ID:26623, to the nucleotide sequence of VGAM1382 RNA, herein designated VGAM RNA, also designated SEQ ID:4093.

[48505] Another function of VGAM1382 is therefore inhibition of FLJ14800 (Accession NM_032840). Accordingly, utilities of VGAM1382 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14800. Junctional Adhesion Molecule 1 (JAM1, Accession NM_144502) is another VGAM1382 host target gene. JAM1 BINDING SITE1 through JAM1 BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by JAM1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JAM1 BINDING SITE1

through JAM1 BINDING SITE⁴, designated SEQ ID:29327, SEQ ID:29336, SEQ ID:29347 and SEQ ID:18860 respectively, to the nucleotide sequence of VGAM1382 RNA, herein designated VGAM RNA, also designated SEQ ID:4093.

[48506] Another function of VGAM1382 is therefore inhibition of Junctional Adhesion Molecule 1 (JAM1, Accession NM_144502). Accordingly, utilities of VGAM1382 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JAM1. KIAA0275 (Accession NM_014767) is another VGAM1382 host target gene. KIAA0275 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0275, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0275 BINDING SITE, designated SEQ ID:16549, to the nucleotide sequence of VGAM1382 RNA, herein designated VGAM RNA, also designated SEQ ID:4093.

[48507] Another function of VGAM1382 is therefore inhibition of KIAA0275 (Accession NM_014767). Accordingly, utilities of VGAM1382 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA0275. KIAA0494 (Accession NM_014774) is another VGAM1382 host target gene. KIAA0494 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0494, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0494 BINDING SITE, designated SEQ ID:16591, to the nucleotide sequence of VGAM1382 RNA, herein designated VGAM RNA, also designated SEQ ID:4093.

[48508] Another function of VGAM1382 is therefore inhibition of KIAA0494 (Accession NM_014774). Accordingly, utilities of VGAM1382 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0494. KIAA1184 (Accession NM_022572) is another VGAM1382 host target gene. KIAA1184 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1184, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1184 BINDING SITE, designated SEQ ID:22896, to the

nucleotide sequence of VGAM1382 RNA, herein designated VGAM RNA, also designated SEQ ID:4093.

[48509] Another function of VGAM1382 is therefore inhibition of KIAA1184 (Accession NM_022572). Accordingly, utilities of VGAM1382 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1184. OBTP (Accession NM_017601) is another VGAM1382 host target gene. OBTP BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by OBTP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OBTP BINDING SITE, designated SEQ ID:19078, to the nucleotide sequence of VGAM1382 RNA, herein designated VGAM RNA, also designated SEQ ID:4093.

[48510] Another function of VGAM1382 is therefore inhibition of OBTP (Accession NM_017601). Accordingly, utilities of VGAM1382 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OBTP. RP4-622L5 (Accession NM_019118) is another VGAM1382 host target gene. RP4-622L5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of

mRNA encoded by RP4-622L5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RP4-622L5 BINDING SITE, designated SEQ ID:21203, to the nucleotide sequence of VGAM1382 RNA, herein designated VGAM RNA, also designated SEQ ID:4093.

[48511] Another function of VGAM1382 is therefore inhibition of RP4-622L5 (Accession NM_019118). Accordingly, utilities of VGAM1382 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RP4-622L5. LOC126302 (Accession XM_059020) is another VGAM1382 host target gene. LOC126302 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC126302, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126302 BINDING SITE, designated SEQ ID:36819, to the nucleotide sequence of VGAM1382 RNA, herein designated VGAM RNA, also designated SEQ ID:4093.

[48512] Another function of VGAM1382 is therefore inhibition of LOC126302 (Accession XM_059020). Accordingly, utilities

of VGAM1382 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126302. LOC127602 (Accession XM_059166) is another VGAM1382 host target gene. LOC127602 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC127602, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC127602 BINDING SITE, designated SEQ ID:36905, to the nucleotide sequence of VGAM1382 RNA, herein designated VGAM RNA, also designated SEQ ID:4093.

[48513] Another function of VGAM1382 is therefore inhibition of LOC127602 (Accession XM_059166). Accordingly, utilities of VGAM1382 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC127602. LOC128954 (Accession XM_066252) is another VGAM1382 host target gene. LOC128954 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC128954, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC128954 BINDING SITE, designated SEQ ID:37322, to the nucleotide sequence of VGAM1382 RNA, herein designated VGAM RNA, also designated SEQ ID:4093.

[48514] Another function of VGAM1382 is therefore inhibition of LOC128954 (Accession XM_066252). Accordingly, utilities of VGAM1382 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC128954. LOC136069 (Accession XM_069689) is another VGAM1382 host target gene. LOC136069 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC136069, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC136069 BINDING SITE, designated SEQ ID:37390, to the nucleotide sequence of VGAM1382 RNA, herein designated VGAM RNA, also designated SEQ ID:4093.

[48515] Another function of VGAM1382 is therefore inhibition of LOC136069 (Accession XM_069689). Accordingly, utilities of VGAM1382 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC136069. LOC148490 (Accession XM_086210) is another VGAM1382 host target gene. LOC148490 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC148490, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148490 BINDING SITE, designated SEQ ID:38545, to the nucleotide sequence of VGAM1382 RNA, herein designated VGAM RNA, also designated SEQ ID:4093.

[48516] Another function of VGAM1382 is therefore inhibition of LOC148490 (Accession XM_086210). Accordingly, utilities of VGAM1382 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148490. LOC149401 (Accession XM_086511) is another VGAM1382 host target gene. LOC149401 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149401, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149401 BINDING SITE, designated SEQ ID:38737, to the nucleotide sequence of VGAM1382 RNA, herein designated VGAM RNA, also designated SEQ ID:4093.

[48517] Another function of VGAM1382 is therefore inhibition of

LOC149401 (Accession XM_086511). Accordingly, utilities of VGAM1382 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149401. LOC157273 (Accession XM_098743) is another VGAM1382 host target gene. LOC157273 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC157273, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157273 BINDING SITE, designated SEQ ID:41785, to the nucleotide sequence of VGAM1382 RNA, herein designated VGAM RNA, also designated SEQ ID:4093.

[48518] Another function of VGAM1382 is therefore inhibition of LOC157273 (Accession XM_098743). Accordingly, utilities of VGAM1382 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157273. LOC160156 (Accession XM_090047) is another VGAM1382 host target gene. LOC160156 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC160156, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC160156 BINDING SITE, designated SEQ ID:39991, to the nucleotide sequence of VGAM1382 RNA, herein designated VGAM RNA, also designated SEQ ID:4093.

[48519] Another function of VGAM1382 is therefore inhibition of LOC160156 (Accession XM_090047). Accordingly, utilities of VGAM1382 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC160156. LOC161247 (Accession XM_090783) is another VGAM1382 host target gene. LOC161247 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC161247, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC161247 BINDING SITE, designated SEQ ID:40015, to the nucleotide sequence of VGAM1382 RNA, herein designated VGAM RNA, also designated SEQ ID:4093.

[48520] Another function of VGAM1382 is therefore inhibition of LOC161247 (Accession XM_090783). Accordingly, utilities of VGAM1382 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC161247. LOC255779 (Accession XM_171147) is an-

other VGAM1382 host target gene. LOC255779 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255779, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255779 BINDING SITE, designated SEQ ID:45942, to the nucleotide sequence of VGAM1382 RNA, herein designated VGAM RNA, also designated SEQ ID:4093.

[48521] Another function of VGAM1382 is therefore inhibition of LOC255779 (Accession XM_171147). Accordingly, utilities of VGAM1382 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255779. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1383 (VGAM1383) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48522] VGAM1383 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1383 was detected is de-

scribed hereinabove with reference to Figs. 1–8.

[48523] VGAM1383 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Himetobi P Virus.

VGAM1383 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48524] VGAM1383 gene encodes a VGAM1383 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1383 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1383 precursor RNA is designated SEQ ID:1369, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1369 is located at position 7039 relative to the genome of Himetobi P Virus.

[48525] VGAM1383 precursor RNA folds onto itself, forming VGAM1383 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA

gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48526] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1383 folded precursor RNA into VGAM1383 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1383 RNA is designated SEQ ID:4094, and is provided hereinbelow with reference to the sequence listing part.

[48527] VGAM1383 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1383 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1383 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[48528] VGAM1383 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1383 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1383 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1383 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1383 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[48529] The complementary binding of VGAM1383 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1383 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1383 host target RNA into VGAM1383 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48530] It is appreciated that VGAM1383 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1383 host target genes. The mRNA of each one of this plurality of VGAM1383 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1383 RNA, herein designated VGAM RNA, and which when bound by VGAM1383 RNA causes inhibition of translation of respective one or more VGAM1383 host target proteins.

[48531] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1383 gene, herein designated VGAM GENE, on one or more VGAM1383 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[48532] It is yet further appreciated that a function of VGAM1383 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1383 include diagnosis, prevention and treatment of viral infection by Himetobi P Virus. Specific functions, and accordingly utilities, of VGAM1383 correlate with, and may be deduced from, the identity of the host target genes which VGAM1383 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48533] Nucleotide sequences of the VGAM1383 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1383 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM1383 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1383 are further described hereinbelow with reference to Table 1.

[48534] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1383 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1383 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48535] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1383 gene, herein designated VGAM is inhibition of expression of VGAM1383 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1383 correlate with, and may be deduced from, the identity of the target genes which VGAM1383 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[48536] Dystrophia Myotonica-protein Kinase (DMPK, Accession NM_004409) is a VGAM1383 host target gene. DMPK BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DMPK, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DMPK BINDING SITE, designated SEQ ID:10662, to the nucleotide sequence of VGAM1383 RNA, herein designated VGAM RNA, also designated SEQ ID:4094.

[48537] A function of VGAM1383 is therefore inhibition of Dys-trophia Myotonica-protein Kinase (DMPK, Accession NM_004409). Accordingly, utilities of VGAM1383 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DMPK. Claudin 15 (CLDN15, Accession NM_138429) is another VGAM1383 host target gene. CLDN15 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLDN15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLDN15 BINDING SITE, designated SEQ ID:28792, to the nucleotide sequence of VGAM1383 RNA, herein designated VGAM RNA, also designated SEQ ID:4094.

[48538] Another function of VGAM1383 is therefore inhibition of Claudin 15 (CLDN15, Accession NM_138429). Accordingly, utilities of VGAM1383 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with CLDN15. Hypermethylated In Cancer 2 (HIC2, Accession XM_036937) is another VGAM1383 host target gene. HIC2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HIC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HIC2 BINDING SITE, designated SEQ ID:32532, to the nucleotide sequence of VGAM1383 RNA, herein designated VGAM RNA, also designated SEQ ID:4094.

[48539] Another function of VGAM1383 is therefore inhibition of Hypermethylated In Cancer 2 (HIC2, Accession XM_036937). Accordingly, utilities of VGAM1383 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HIC2. KIAA1189 (Accession XM_050508) is another VGAM1383 host target gene. KIAA1189 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1189, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1189 BINDING SITE, designated SEQ

ID:35651, to the nucleotide sequence of VGAM1383 RNA, herein designated VGAM RNA, also designated SEQ ID:4094.

[48540] Another function of VGAM1383 is therefore inhibition of KIAA1189 (Accession XM_050508). Accordingly, utilities of VGAM1383 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1189. KIAA1500 (Accession XM_034353) is another VGAM1383 host target gene. KIAA1500 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1500, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1500 BINDING SITE, designated SEQ ID:32062, to the nucleotide sequence of VGAM1383 RNA, herein designated VGAM RNA, also designated SEQ ID:4094.

[48541] Another function of VGAM1383 is therefore inhibition of KIAA1500 (Accession XM_034353). Accordingly, utilities of VGAM1383 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1500. NIR3 (Accession XM_038799) is another VGAM1383 host target gene. NIR3 BINDING SITE is HOST

TARGET binding site found in the 3` untranslated region of mRNA encoded by NIR3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NIR3 BINDING SITE, designated SEQ ID:32923, to the nucleotide sequence of VGAM1383 RNA, herein designated VGAM RNA, also designated SEQ ID:4094.

[48542] Another function of VGAM1383 is therefore inhibition of NIR3 (Accession XM_038799). Accordingly, utilities of VGAM1383 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NIR3. SPBPBP (Accession NM_006692) is another VGAM1383 host target gene. SPBPBP BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SPBPBP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPBPBP BINDING SITE, designated SEQ ID:13508, to the nucleotide sequence of VGAM1383 RNA, herein designated VGAM RNA, also designated SEQ ID:4094.

[48543] Another function of VGAM1383 is therefore inhibition of

SPBPBP (Accession NM_006692). Accordingly, utilities of VGAM1383 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPBPBP. Signal Transducer and Activator of Transcription 2, 113kDa (STAT2, Accession NM_005419) is another VGAM1383 host target gene. STAT2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by STAT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STAT2 BINDING SITE, designated SEQ ID:11890, to the nucleotide sequence of VGAM1383 RNA, herein designated VGAM RNA, also designated SEQ ID:4094.

[48544] Another function of VGAM1383 is therefore inhibition of Signal Transducer and Activator of Transcription 2, 113kDa (STAT2, Accession NM_005419). Accordingly, utilities of VGAM1383 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STAT2. LOC119392 (Accession NM_145247) is another VGAM1383 host target gene. LOC119392 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC119392, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC119392 BINDING SITE, designated SEQ ID:29757, to the nucleotide sequence of VGAM1383 RNA, herein designated VGAM RNA, also designated SEQ ID:4094.

[48545] Another function of VGAM1383 is therefore inhibition of LOC119392 (Accession NM_145247). Accordingly, utilities of VGAM1383 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC119392. LOC123242 (Accession XM_063548) is another VGAM1383 host target gene. LOC123242 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC123242, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC123242 BINDING SITE, designated SEQ ID:37238, to the nucleotide sequence of VGAM1383 RNA, herein designated VGAM RNA, also designated SEQ ID:4094.

[48546] Another function of VGAM1383 is therefore inhibition of LOC123242 (Accession XM_063548). Accordingly, utilities of VGAM1383 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC123242. LOC221688 (Accession XM_168085) is another VGAM1383 host target gene. LOC221688 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221688, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221688 BINDING SITE, designated SEQ ID:44990, to the nucleotide sequence of VGAM1383 RNA, herein designated VGAM RNA, also designated SEQ ID:4094.

[48547] Another function of VGAM1383 is therefore inhibition of LOC221688 (Accession XM_168085). Accordingly, utilities of VGAM1383 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221688. LOC253001 (Accession XM_171711) is another VGAM1383 host target gene. LOC253001 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253001, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253001 BINDING SITE, designated SEQ ID:46055, to

the nucleotide sequence of VGAM1383 RNA, herein designated VGAM RNA, also designated SEQ ID:4094.

[48548] Another function of VGAM1383 is therefore inhibition of LOC253001 (Accession XM_171711). Accordingly, utilities of VGAM1383 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253001. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1384 (VGAM1384) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48549] VGAM1384 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1384 was detected is described hereinabove with reference to Figs. 1–8.

[48550] VGAM1384 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Himetobi P Virus. VGAM1384 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48551] VGAM1384 gene encodes a VGAM1384 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1384 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1384 precursor RNA is designated SEQ ID:1370, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1370 is located at position 1905 relative to the genome of Himetobi P Virus.

[48552] VGAM1384 precursor RNA folds onto itself, forming VGAM1384 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48553] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1384 folded precursor RNA into VGAM1384 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1384 RNA is designated SEQ ID:4095, and is provided hereinbelow with reference to the sequence listing part.

[48554] VGAM1384 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1384 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1384 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[48555] VGAM1384 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1384 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1384 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1384 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1384 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[48556] The complementary binding of VGAM1384 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1384 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1384 host target RNA into VGAM1384 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48557] It is appreciated that VGAM1384 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1384 host target genes. The mRNA of each one of this plurality of VGAM1384 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1384 RNA, herein designated VGAM RNA, and which when bound by VGAM1384 RNA causes inhibition of translation of respective one or more VGAM1384 host target proteins.

[48558] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1384 gene, herein designated VGAM GENE, on one or more VGAM1384 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[48559] It is yet further appreciated that a function of VGAM1384 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1384 include diagnosis, prevention and treatment of viral infection by Himetobi P Virus. Specific functions, and accordingly utilities, of VGAM1384 correlate with, and may be deduced from, the identity of the host target genes which VGAM1384 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48560] Nucleotide sequences of the VGAM1384 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1384 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1384 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1384 are further described hereinbelow with reference to Table 1.

[48561] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1384 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM1384 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48562] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1384 gene, herein designated VGAM is inhibition of expression of VGAM1384 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1384 correlate with, and may be deduced from, the identity of the target genes which VGAM1384 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[48563] Homeo Box D3 (HOXD3, Accession NM_006898) is a VGAM1384 host target gene. HOXD3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HOXD3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HOXD3 BINDING SITE, designated SEQ ID:13775, to the nucleotide sequence of VGAM1384 RNA, herein designated VGAM RNA, also designated SEQ ID:4095.

[48564] A function of VGAM1384 is therefore inhibition of Homeo Box D3 (HOXD3, Accession NM_006898), a gene which

plays a role in the differentiation process of hematopoietic cells. Accordingly, utilities of VGAM1384 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HOXD3. The function of HOXD3 has been established by previous studies. Magli et al. (1991) presented evidence that the genomic organization of the human HOX genes reflects a regulatory hierarchy involved in the differentiation process of hematopoietic cells. Their results demonstrated that cells representing various stages of hematopoietic differentiation display differential patterns of HOX gene expression and that HOX genes are coordinately switched on or off in blocks that may include entire clusters. The entire HOX4 cluster was silent in all erythroleukemic, promyelocytic, and monocytic cell lines analyzed, and almost all the so-called HOX-2 genes (e.g., HOX2A; 142960; also symbolized HOXB5) were active in erythroleukemic cells and turned off in myeloid-restricted cells. Taniguchi et al. (1995) showed that overexpression of the HOX4A (HOXD3) gene in erythroleukemia cells resulted in increased levels of the GP IIb/IIIa complex (ITGA2B; 273800) and corresponding mRNA levels. The results implicated the HOXD3 gene in the regulation of cell adhesion processes. Animal model

experiments lend further support to the function of HOXD3. To examine directly the nature of functional overlap within the Hox3 family, Greer et al. (2000) exchanged reciprocally in the genome of mice the protein-coding portions of the Hoxa3 (OMIM Ref. No. 142954) and Hoxd3 genes. Thus, they generated mice that lacked any Hoxa3 protein but instead expressed the Hoxd3 protein from both the Hoxa3 and Hoxd3 loci, as well as mice that lacked Hoxd3 protein but expressed Hoxa3 from both loci. Embryos representing all Hoxa3 allelic combinations were examined histologically. At embryonic day 17.5, homozygous null Hoxa3 embryos demonstrated complete absence of the thymus. However, replacement of one or both copies of the Hoxa3 protein with the Hoxd3 protein restored this organ. Alterations of the hyoid cartilage, which is characteristic of embryos homozygous for the null allele of Hoxa3, were reversed by expression of the Hoxd3 protein at the Hoxa3 locus. One conclusion from this data was that the Hoxd3 protein is functionally equivalent to the Hoxa3 protein if it is expressed in the context of the Hoxa3 gene. A corollary would be that the Hoxa3 protein, if expressed at the Hoxd3 locus, would be unable to complement null mutations at Hoxa3. This was shown

to be the case. Hoxa3 protein was able to complement Hoxd3 deficiency when expressed in the context of the Hoxd3 allele. Greer et al. (2000) concluded that bidirectional complementation demonstrated that these proteins, which share less than 50% identity in the amino acid sequence, are capable of carrying out equivalent biologic functions in the processes recognized to require Hox3 gene activity. In addition, it provided direct evidence that the different roles played by these genes during embryogenesis are mainly the result of cis-acting sequences that modulate expression of the individual loci.

[48565] It is appreciated that the abovementioned animal model for HOXD3 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[48566] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[48567] Magli, M. C.; Barba, P.; Celetti, A.; De Vita, G.; Cillo, C.; Boncinelli, E. : Coordinate regulation of HOX genes in human hematopoietic cells. Proc. Nat. Acad. Sci. 88: 6348-6352, 1991. ; and

[48568] Taniguchi, Y.; Komatsu, N.; Moriuchi, T. : Overexpression

of the HOX4A (HOXD3) homeobox gene in human erythroleukemia HEL cells results in altered adhesive properties. Blood 85: 2786–279.

[48569] Further studies establishing the function and utilities of HOXD3 are found in John Hopkins OMIM database record ID 142980, and in cited publications numbered 5207, 318 and 5222–3187 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Jerky Homolog (mouse) (JRK, Accession XM_098818) is another VGAM1384 host target gene. JRK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by JRK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JRK BINDING SITE, designated SEQ ID:41838, to the nucleotide sequence of VGAM1384 RNA, herein designated VGAM RNA, also designated SEQ ID:4095.

[48570] Another function of VGAM1384 is therefore inhibition of Jerky Homolog (mouse) (JRK, Accession XM_098818), a gene which might function as a DNA-binding protein. Accordingly, utilities of VGAM1384 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with JRK. The function of JRK and its association with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM210.3-oxoacid CoA Transferase (OXCT, Accession NM_000436) is another VGAM1384 host target gene. OXCT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OXCT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OXCT BINDING SITE, designated SEQ ID:6020, to the nucleotide sequence of VGAM1384 RNA, herein designated VGAM RNA, also designated SEQ ID:4095.

[48571] Another function of VGAM1384 is therefore inhibition of 3-oxoacid CoA Transferase (OXCT, Accession NM_000436). Accordingly, utilities of VGAM1384 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OXCT. BH-protocadherin (brain-heart) (PCDH7, Accession NM_032456) is another VGAM1384 host target gene. PCDH7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDH7, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDH7 BINDING SITE, designated SEQ ID:26216, to the nucleotide sequence of VGAM1384 RNA, herein designated VGAM RNA, also designated SEQ ID:4095.

[48572] Another function of VGAM1384 is therefore inhibition of BH-protocadherin (brain-heart) (PCDH7, Accession NM_032456). Accordingly, utilities of VGAM1384 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH7. Protein Kinase, AMP-activated, Beta 1 Non-catalytic Subunit (PRKAB1, Accession NM_006253) is another VGAM1384 host target gene. PRKAB1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRKAB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRKAB1 BINDING SITE, designated SEQ ID:12932, to the nucleotide sequence of VGAM1384 RNA, herein designated VGAM RNA, also designated SEQ ID:4095.

[48573] Another function of VGAM1384 is therefore inhibition of

Protein Kinase, AMP-activated, Beta 1 Non-catalytic Subunit (PRKAB1, Accession NM_006253), a gene which is responsible for the regulation of fatty acid synthesis by phosphorylation of acetyl-coa carboxylase. Accordingly, utilities of VGAM1384 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKAB1. The function of PRKAB1 has been established by previous studies. The mammalian 5-prime-AMP-activated protein kinase (AMPK) appears to act as a metabolic stress-sensing protein kinase. AMPK is a heterotrimeric protein composed of a catalytic alpha subunit, a noncatalytic beta subunit, and a noncatalytic gamma subunit. See PRKAA1 (OMIM Ref. No. 602739) for additional background. Using PCR with degenerate oligonucleotides based on the rat Ampk-beta-1 protein sequence, Woods et al. (1996) isolated rat liver cDNAs encoding Ampk-beta-1. Both the Ampk-beta-1 mRNA and protein are widely expressed in rat tissues. The predicted 270-amino acid protein has a calculated mass of 30 kD, but Woods et al. (1996) reported that it migrates as a 38-kD protein by SDS-PAGE. Immunoprecipitation studies suggested that Ampk-beta-1 mediates the association of the AMPK heterotrimeric complex in vitro. By searching

the sequence databases with a rat Ampk-beta-1 cDNA, Stapleton et al. (1997) identified an EST encoding human AMPK-beta-1. The human and rat AMPK-beta-1 proteins have 95% amino acid sequence identity. Thornton et al. (1998) reported that the predicted 271-amino acid human AMPK-beta-1 protein shares 71% sequence identity with human AMPK-beta-2 (PRKAB2; 602741). They found that both beta isoforms form complexes with Ampk-alpha-1 (OMIM Ref. No. PRKAA1) and Ampk-alpha-2 (PRKAA2; 600497) in rat liver and skeletal muscle. Coexpression of the alpha and AMPK-gamma-1 (PRKAG1; 602742) subunits with either AMPK-beta-1 or AMPK-beta-2 in mammalian cells did not reveal a significant difference in AMPK activity between the 2 beta isoforms. Using Western blot analysis and immunoprecipitation studies, Thornton et al. (1998) determined that Ampk-beta-1 was expressed at higher levels than Ampk-beta-2 in rat liver, while Ampk-beta-2 was more abundant in skeletal muscle. They suggested that the marked difference in expression patterns of Ampk-beta-1 and Ampk-beta-2 indicates tissue-specific roles for these isoforms. By Northern blot analysis, Thornton et al. (1998) found that AMPK-beta-1 was expressed as a 3-kb mRNA in all tissues tested. Stapleton

et al. (1997) mapped the human AMPK-beta-1 gene to 12q24.1 by fluorescence in situ hybridization

[48574] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[48575] Stapleton, D.; Woollatt, E.; Mitchelhill, K. I.; Nicholl, J. K.; Fernandez, C. S.; Michell, B. J.; Witters, L. A.; Power, D. A.; Sutherland, G. R.; Kemp, B. E. : AMP-activated protein kinase isoenzyme family: subunit structure and chromosomal location. FEBS Lett. 409: 452-456, 1997. ; and

[48577] Further studies establishing the function and utilities of PRKAB1 are found in John Hopkins OMIM database record ID 602740, and in cited publications numbered 10696-5324 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Prospero-related Homeobox 1 (PROX1, Accession NM_002763) is another VGAM1384 host target gene. PROX1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by

PROX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PROX1 BINDING SITE, designated SEQ ID:8649, to the nucleotide sequence of VGAM1384 RNA, herein designated VGAM RNA, also designated SEQ ID:4095.

[48578] Another function of VGAM1384 is therefore inhibition of Prospero-related Homeobox 1 (PROX1, Accession NM_002763), a gene which may regulate gene expression and development of postmitotic undifferentiated young neurons. Accordingly, utilities of VGAM1384 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PROX1. The function of PROX1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM430.SMT3 Suppressor of Mif Two 3 Homolog 1 (yeast) (SMT3H1, Accession XM_009805) is another VGAM1384 host target gene. SMT3H1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SMT3H1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of SMT3H1 BINDING SITE, designated SEQ ID:30128, to the nucleotide sequence of VGAM1384 RNA, herein designated VGAM RNA, also designated SEQ ID:4095.

[48579] Another function of VGAM1384 is therefore inhibition of SMT3 Suppressor of Mif Two 3 Homolog 1 (yeast) (SMT3H1, Accession XM_009805), a gene which is involved in the function and/or structure of the eukaryotic kinetochore. Accordingly, utilities of VGAM1384 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMT3H1. The function of SMT3H1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM119. Transient Receptor Potential Cation Channel, Subfamily C, Member 1 (TRPC1, Accession NM_003304) is another VGAM1384 host target gene. TRPC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRPC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPC1 BIND-

ING SITE, designated SEQ ID:9309, to the nucleotide sequence of VGAM1384 RNA, herein designated VGAM RNA, also designated SEQ ID:4095.

[48580] Another function of VGAM1384 is therefore inhibition of Transient Receptor Potential Cation Channel, Subfamily C, Member 1 (TRPC1, Accession NM_003304), a gene which acts as a non-voltage-sensitive store-operated Ca^{2+} channel. Accordingly, utilities of VGAM1384 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPC1. The function of TRPC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200. Butyrophilin, Subfamily 1, Member A1 (BTN1A1, Accession NM_001732) is another VGAM1384 host target gene. BTN1A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BTN1A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BTN1A1 BINDING SITE, designated SEQ ID:7468, to the nucleotide sequence of VGAM1384 RNA, herein designated VGAM RNA, also designated SEQ

ID:4095.

[48581] Another function of VGAM1384 is therefore inhibition of Butyrophilin, Subfamily 1, Member A1 (BTN1A1, Accession NM_001732). Accordingly, utilities of VGAM1384 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BTN1A1. CRA (Accession NM_006697) is another VGAM1384 host target gene. CRA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CRA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRA BINDING SITE, designated SEQ ID:13517, to the nucleotide sequence of VGAM1384 RNA, herein designated VGAM RNA, also designated SEQ ID:4095.

[48582] Another function of VGAM1384 is therefore inhibition of CRA (Accession NM_006697). Accordingly, utilities of VGAM1384 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRA. DKFZP434A043 (Accession NM_015396) is another VGAM1384 host target gene. DKFZP434A043 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZP434A043,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434A043 BINDING SITE, designated SEQ ID:17706, to the nucleotide sequence of VGAM1384 RNA, herein designated VGAM RNA, also designated SEQ ID:4095.

[48583] Another function of VGAM1384 is therefore inhibition of DKFZP434A043 (Accession NM_015396). Accordingly, utilities of VGAM1384 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434A043. FLJ10853 (Accession NM_018246) is another VGAM1384 host target gene. FLJ10853 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ10853, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10853 BINDING SITE, designated SEQ ID:20215, to the nucleotide sequence of VGAM1384 RNA, herein designated VGAM RNA, also designated SEQ ID:4095.

[48584] Another function of VGAM1384 is therefore inhibition of FLJ10853 (Accession NM_018246). Accordingly, utilities of

VGAM1384 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10853. FLJ23462 (Accession NM_024843) is another VGAM1384 host target gene. FLJ23462 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23462, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23462 BINDING SITE, designated SEQ ID:24269, to the nucleotide sequence of VGAM1384 RNA, herein designated VGAM RNA, also designated SEQ ID:4095.

[48585] Another function of VGAM1384 is therefore inhibition of FLJ23462 (Accession NM_024843). Accordingly, utilities of VGAM1384 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23462. HSPC019 (Accession NM_014028) is another VGAM1384 host target gene. HSPC019 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSPC019, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPC019

BINDING SITE, designated SEQ ID:15253, to the nucleotide sequence of VGAM1384 RNA, herein designated VGAM RNA, also designated SEQ ID:4095.

[48586] Another function of VGAM1384 is therefore inhibition of HSPC019 (Accession NM_014028). Accordingly, utilities of VGAM1384 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPC019. KIAA0057 (Accession NM_012288) is another VGAM1384 host target gene. KIAA0057 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0057, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0057 BINDING SITE, designated SEQ ID:14625, to the nucleotide sequence of VGAM1384 RNA, herein designated VGAM RNA, also designated SEQ ID:4095.

[48587] Another function of VGAM1384 is therefore inhibition of KIAA0057 (Accession NM_012288). Accordingly, utilities of VGAM1384 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0057. KIAA0429 (Accession NM_014751) is another VGAM1384 host target gene. KIAA0429 BINDING SITE is

HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0429, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0429 BINDING SITE, designated SEQ ID:16474, to the nucleotide sequence of VGAM1384 RNA, herein designated VGAM RNA, also designated SEQ ID:4095.

[48588] Another function of VGAM1384 is therefore inhibition of KIAA0429 (Accession NM_014751). Accordingly, utilities of VGAM1384 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0429. KIAA0523 (Accession XM_041964) is another VGAM1384 host target gene. KIAA0523 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0523, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0523 BINDING SITE, designated SEQ ID:33641, to the nucleotide sequence of VGAM1384 RNA, herein designated VGAM RNA, also designated SEQ ID:4095.

[48589] Another function of VGAM1384 is therefore inhibition of

KIAA0523 (Accession XM_041964). Accordingly, utilities of VGAM1384 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0523. KIAA1538 (Accession XM_049474) is another VGAM1384 host target gene. KIAA1538 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1538, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1538 BINDING SITE, designated SEQ ID:35436, to the nucleotide sequence of VGAM1384 RNA, herein designated VGAM RNA, also designated SEQ ID:4095.

[48590] Another function of VGAM1384 is therefore inhibition of KIAA1538 (Accession XM_049474). Accordingly, utilities of VGAM1384 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1538. KIAA1644 (Accession XM_097892) is another VGAM1384 host target gene. KIAA1644 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1644, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1644 BINDING SITE, designated SEQ ID:41202, to the nucleotide sequence of VGAM1384 RNA, herein designated VGAM RNA, also designated SEQ ID:4095.

[48591] Another function of VGAM1384 is therefore inhibition of KIAA1644 (Accession XM_097892). Accordingly, utilities of VGAM1384 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1644. S164 (Accession XM_027330) is another VGAM1384 host target gene. S164 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by S164, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of S164 BINDING SITE, designated SEQ ID:30484, to the nucleotide sequence of VGAM1384 RNA, herein designated VGAM RNA, also designated SEQ ID:4095.

[48592] Another function of VGAM1384 is therefore inhibition of S164 (Accession XM_027330). Accordingly, utilities of VGAM1384 include diagnosis, prevention and treatment of diseases and clinical conditions associated with S164. Serine/threonine Kinase 33 (STK33, Accession

XM_031831) is another VGAM1384 host target gene.

STK33 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by STK33, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STK33 BINDING SITE, designated SEQ ID:31496, to the nucleotide sequence of VGAM1384 RNA, herein designated VGAM RNA, also designated SEQ ID:4095.

[48593] Another function of VGAM1384 is therefore inhibition of Serine/threonine Kinase 33 (STK33, Accession XM_031831). Accordingly, utilities of VGAM1384 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STK33. LOC118611 (Accession XM_061055) is another VGAM1384 host target gene. LOC118611 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC118611, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC118611 BINDING SITE, designated SEQ ID:37186, to the nucleotide sequence of

VGAM1384 RNA, herein designated VGAM RNA, also designated SEQ ID:4095.

[48594] Another function of VGAM1384 is therefore inhibition of LOC118611 (Accession XM_061055). Accordingly, utilities of VGAM1384 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC118611. LOC124044 (Accession XM_071871) is another VGAM1384 host target gene. LOC124044 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC124044, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC124044 BINDING SITE, designated SEQ ID:37434, to the nucleotide sequence of VGAM1384 RNA, herein designated VGAM RNA, also designated SEQ ID:4095.

[48595] Another function of VGAM1384 is therefore inhibition of LOC124044 (Accession XM_071871). Accordingly, utilities of VGAM1384 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124044. LOC144110 (Accession XM_084735) is another VGAM1384 host target gene. LOC144110 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC144110, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144110 BINDING SITE, designated SEQ ID:37678, to the nucleotide sequence of VGAM1384 RNA, herein designated VGAM RNA, also designated SEQ ID:4095.

[48596] Another function of VGAM1384 is therefore inhibition of LOC144110 (Accession XM_084735). Accordingly, utilities of VGAM1384 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144110. LOC149832 (Accession XM_097733) is another VGAM1384 host target gene. LOC149832 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149832, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149832 BINDING SITE, designated SEQ ID:41080, to the nucleotide sequence of VGAM1384 RNA, herein designated VGAM RNA, also designated SEQ ID:4095.

[48597] Another function of VGAM1384 is therefore inhibition of LOC149832 (Accession XM_097733). Accordingly, utilities

of VGAM1384 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149832. LOC155038 (Accession XM_088130) is another VGAM1384 host target gene. LOC155038 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC155038, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155038 BINDING SITE, designated SEQ ID:39534, to the nucleotide sequence of VGAM1384 RNA, herein designated VGAM RNA, also designated SEQ ID:4095.

[48598] Another function of VGAM1384 is therefore inhibition of LOC155038 (Accession XM_088130). Accordingly, utilities of VGAM1384 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155038. LOC220020 (Accession XM_167821) is another VGAM1384 host target gene. LOC220020 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220020, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC220020 BINDING SITE, designated SEQ ID:44868, to the nucleotide sequence of VGAM1384 RNA, herein designated VGAM RNA, also designated SEQ ID:4095.

[48599] Another function of VGAM1384 is therefore inhibition of LOC220020 (Accession XM_167821). Accordingly, utilities of VGAM1384 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220020. LOC253842 (Accession XM_173230) is another VGAM1384 host target gene. LOC253842 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253842, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253842 BINDING SITE, designated SEQ ID:46505, to the nucleotide sequence of VGAM1384 RNA, herein designated VGAM RNA, also designated SEQ ID:4095.

[48600] Another function of VGAM1384 is therefore inhibition of LOC253842 (Accession XM_173230). Accordingly, utilities of VGAM1384 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253842. LOC255475 (Accession XM_174861) is another VGAM1384 host target gene. LOC255475 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC255475, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255475 BINDING SITE, designated SEQ ID:46605, to the nucleotide sequence of VGAM1384 RNA, herein designated VGAM RNA, also designated SEQ ID:4095.

[48601] Another function of VGAM1384 is therefore inhibition of LOC255475 (Accession XM_174861). Accordingly, utilities of VGAM1384 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255475. LOC91263 (Accession XM_037264) is another VGAM1384 host target gene. LOC91263 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC91263, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91263 BINDING SITE, designated SEQ ID:32595, to the nucleotide sequence of VGAM1384 RNA, herein designated VGAM RNA, also designated SEQ ID:4095.

[48602] Another function of VGAM1384 is therefore inhibition of

LOC91263 (Accession XM_037264). Accordingly, utilities of VGAM1384 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91263. LOC91818 (Accession XM_040878) is another VGAM1384 host target gene. LOC91818 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91818, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91818 BINDING SITE, designated SEQ ID:33406, to the nucleotide sequence of VGAM1384 RNA, herein designated VGAM RNA, also designated SEQ ID:4095.

[48603] Another function of VGAM1384 is therefore inhibition of LOC91818 (Accession XM_040878). Accordingly, utilities of VGAM1384 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91818. LOC91923 (Accession XM_041526) is another VGAM1384 host target gene. LOC91923 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91923, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC91923 BINDING SITE, designated SEQ ID:33546, to the nucleotide sequence of VGAM1384 RNA, herein designated VGAM RNA, also designated SEQ ID:4095.

[48604] Another function of VGAM1384 is therefore inhibition of LOC91923 (Accession XM_041526). Accordingly, utilities of VGAM1384 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91923. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1385 (VGAM1385) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48605] VGAM1385 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1385 was detected is described hereinabove with reference to Figs. 1–8.

[48606] VGAM1385 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Himetobi P Virus. VGAM1385 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[48607] VGAM1385 gene encodes a VGAM1385 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1385 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1385 precursor RNA is designated SEQ ID:1371, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1371 is located at position 2435 relative to the genome of Himetobi P Virus.

[48608] VGAM1385 precursor RNA folds onto itself, forming VGAM1385 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48609] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1385 folded precursor RNA into VGAM1385 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1385 RNA is designated SEQ ID:4096, and is provided hereinbelow with reference to the sequence listing part.

[48610] VGAM1385 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1385 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1385 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[48611] VGAM1385 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1385 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1385 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1385 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1385 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[48612] The complementary binding of VGAM1385 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1385 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1385 host target RNA into VGAM1385 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48613] It is appreciated that VGAM1385 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1385 host target genes. The mRNA of each one of this plurality of VGAM1385 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1385 RNA, herein designated VGAM RNA, and which when bound by VGAM1385 RNA causes inhibition of translation of respective one or more VGAM1385 host target proteins.

[48614] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1385 gene, herein designated VGAM GENE, on one or more VGAM1385 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[48615] It is yet further appreciated that a function of VGAM1385 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1385 include diagnosis, prevention and treatment of viral infection by Himetobi P Virus. Specific functions, and accordingly utilities, of VGAM1385 correlate with, and may be deduced from, the identity of the host target genes which VGAM1385 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48616] Nucleotide sequences of the VGAM1385 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1385 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1385 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1385 are further described hereinbelow with reference to Table 1.

[48617] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM1385 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1385 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48618] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1385 gene, herein designated VGAM is inhibition of expression of VGAM1385 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1385 correlate with, and may be deduced from, the identity of the target genes which VGAM1385 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[48619] Adenosine A1 Receptor (ADORA1, Accession NM_000674) is a VGAM1385 host target gene. ADORA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADORA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADORA1 BINDING SITE, designated SEQ ID:6328, to the nucleotide sequence of VGAM1385 RNA, herein designated VGAM RNA, also designated SEQ ID:4096.

[48620] A function of VGAM1385 is therefore inhibition of Adenosine A1 Receptor (ADORA1, Accession NM_000674), a gene which the activity of this receptor is mediated by G proteins which inhibit adenylyl cyclase. Accordingly, utilities of VGAM1385 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADORA1. The function of ADORA1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM234. Anaplastic Lymphoma Kinase (Ki-1) (ALK, Accession XM_055726) is another VGAM1385 host target gene. ALK BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ALK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ALK BINDING SITE, designated SEQ ID:36321, to the nucleotide sequence of VGAM1385 RNA, herein designated VGAM RNA, also designated SEQ ID:4096.

[48621] Another function of VGAM1385 is therefore inhibition of Anaplastic Lymphoma Kinase (Ki-1) (ALK, Accession XM_055726). Accordingly, utilities of VGAM1385 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with ALK. Frequently Rearranged In Advanced T-cell Lymphomas 2 (FRAT2, Accession NM_012083) is another VGAM1385 host target gene. FRAT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FRAT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FRAT2 BINDING SITE, designated SEQ ID:14372, to the nucleotide sequence of VGAM1385 RNA, herein designated VGAM RNA, also designated SEQ ID:4096.

[48622] Another function of VGAM1385 is therefore inhibition of Frequently Rearranged In Advanced T-cell Lymphomas 2 (FRAT2, Accession NM_012083), a gene which binds gsk-3 and prevents gsk-3-dependent phosphorylation. Accordingly, utilities of VGAM1385 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FRAT2. The function of FRAT2 has been established by previous studies. Dorsal accumulation of beta-catenin (CTNNB1; 116806) in early *Xenopus* embryos is required for body axis formation. Beta-catenin is dor-

sally stabilized by the localized inhibition of the kinase GSK3 (see OMIM Ref. No. GSK3B; 605004). Using a yeast 2-hybrid system to identify a cytoplasmic regulator of Xenopus GSK3, Yost et al. (1998) isolated an oocyte cDNA encoding a 169-amino acid protein that they termed GSK3-binding protein, or GBP. By searching sequence databases, Yost et al. (1998) identified 2 homologous human sequences, FRAT1 (OMIM Ref. No. 602503) and FRAT2, a partial sequence that shares 59% amino acid identity with FRAT1. Sequence analysis predicted that GBP and the FRAT proteins contain 3 well-conserved regions. Binding and functional analyses revealed that the GSK3-binding and -inhibitory activities of GBP and FRAT2 reside in the C-terminal conserved domain III sequence. The authors proposed that GBP, FRAT1, and FRAT2 form a family of GSK3-binding proteins that inhibit the phosphorylation of beta-catenin, preventing its degradation by the ubiquitin-proteasome pathway. By screening a fetal lung cDNA library with an FT2S probe, which was obtained from a gastric cancer cell line, that corresponds to an FRAT2 EST, Saitoh et al. (2001) isolated a full-length cDNA encoding FRAT2. The deduced 233-amino acid protein, which is 77% identical to FRAT1, contains an N-

terminal acidic domain followed by a proline-rich domain and a GSK3B-binding domain near the C terminus, which is highly divergent from that of FRAT1. Northern blot analysis detected a 2.4-kb transcript, with highest expression in pancreas, heart, spleen, placenta, skeletal muscle, liver, peripheral blood leukocytes, and fetal kidney. Expression was higher in gastric cancer, cervical cancer, and chronic myelogenous leukemia cell lines than in other cancer cell lines. Functional analysis in the *Xenopus* axis duplication assay indicated that FRAT2 is a positive regulator of the WNT (see OMIM Ref. No. 164975) signaling pathway. Saitoh et al. (2001) suggested that upregulation of FRAT2 in human cancer may be implicated in carcinogenesis through activation of the WNT signaling pathway.

[48623] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[48624] Saitoh, T.; Moriwaki, J.; Koike, J.; Takagi, A.; Miwa, T.; Shiokawa, K.; Katoh, M. : Molecular cloning and characterization of FRAT2, encoding a positive regulator of the WNT signaling pathway. *Biochem. Biophys. Res. Commun.* 281: 815–820, 2001. ; and

[48625] Yost, C.; Farr, G. H., III; Pierce, S. B.; Ferkey, D. M.; Chen, M. M.; Kimelman, D. : GBP, an inhibitor of GSK-3, is implicated in *Xenopus* development and oncogenesis. *Cell* 93: 1031-10.

[48626] Further studies establishing the function and utilities of FRAT2 are found in John Hopkins OMIM database record ID 605006, and in cited publications numbered 291 and 9026 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. FLJ10726 (Accession NM_018195) is another VGAM1385 host target gene. FLJ10726 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10726, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10726 BINDING SITE, designated SEQ ID:20056, to the nucleotide sequence of VGAM1385 RNA, herein designated VGAM RNA, also designated SEQ ID:4096.

[48627] Another function of VGAM1385 is therefore inhibition of FLJ10726 (Accession NM_018195). Accordingly, utilities of VGAM1385 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ10726. LOC219848 (Accession XM_166170) is another VGAM1385 host target gene. LOC219848 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219848, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219848 BINDING SITE, designated SEQ ID:43987, to the nucleotide sequence of VGAM1385 RNA, herein designated VGAM RNA, also designated SEQ ID:4096.

[48628] Another function of VGAM1385 is therefore inhibition of LOC219848 (Accession XM_166170). Accordingly, utilities of VGAM1385 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219848. LOC255031 (Accession XM_173187) is another VGAM1385 host target gene. LOC255031 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255031, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255031 BINDING SITE, designated SEQ ID:46432, to the nucleotide sequence of VGAM1385 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4096.

[48629] Another function of VGAM1385 is therefore inhibition of LOC255031 (Accession XM_173187). Accordingly, utilities of VGAM1385 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255031. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1386 (VGAM1386) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48630] VGAM1386 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1386 was detected is described hereinabove with reference to Figs. 1–8.

[48631] VGAM1386 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Himetobi P Virus. VGAM1386 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48632] VGAM1386 gene encodes a VGAM1386 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM1386 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1386 precursor RNA is designated SEQ ID:1372, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1372 is located at position 8878 relative to the genome of Himetobi P Virus.

- [48633] VGAM1386 precursor RNA folds onto itself, forming VGAM1386 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [48634] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1386 folded precursor RNA into VGAM1386 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM1386 RNA is designated SEQ ID:4097, and is provided hereinbelow with reference to the sequence listing part.

[48635] VGAM1386 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1386 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1386 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[48636] VGAM1386 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1386 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1386 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1386 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1386 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[48637] The complementary binding of VGAM1386 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1386 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1386 host target RNA into VGAM1386 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48638] It is appreciated that VGAM1386 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1386 host target genes. The mRNA of

each one of this plurality of VGAM1386 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1386 RNA, herein designated VGAM RNA, and which when bound by VGAM1386 RNA causes inhibition of translation of respective one or more VGAM1386 host target proteins.

[48639] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1386 gene, herein designated VGAM GENE, on one or more VGAM1386 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[48640] It is yet further appreciated that a function of VGAM1386 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1386 include diagnosis, prevention and treatment of viral infection by Himetobi P Virus. Specific functions, and accordingly utilities, of VGAM1386 correlate with, and may be deduced from, the identity of the host target genes which VGAM1386 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48641] Nucleotide sequences of the VGAM1386 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1386 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1386 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1386 are further described hereinbelow with reference to Table 1.

[48642] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1386 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1386 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48643] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1386 gene, herein designated VGAM is inhibition of expression of VGAM1386 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1386 correlate with, and may be deduced from, the identity of the target genes which VGAM1386 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[48644] ATPase, Class VI, Type 11A (ATP11A, Accession XM_085028) is a VGAM1386 host target gene. ATP11A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP11A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP11A BINDING SITE, designated SEQ ID:37803, to the nucleotide sequence of VGAM1386 RNA, herein designated VGAM RNA, also designated SEQ ID:4097.

[48645] A function of VGAM1386 is therefore inhibition of ATPase, Class VI, Type 11A (ATP11A, Accession XM_085028). Accordingly, utilities of VGAM1386 include diagnosis, pre-

vention and treatment of diseases and clinical conditions associated with ATP11A. Integrin, Alpha M (complement component receptor 3, alpha; also known as CD11b (p170), Macrophage Antigen Alpha Polypeptide) (ITGAM, Accession NM_000632) is another VGAM1386 host target gene. ITGAM BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ITGAM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGAM BINDING SITE, designated SEQ ID:6247, to the nucleotide sequence of VGAM1386 RNA, herein designated VGAM RNA, also designated SEQ ID:4097.

[48646] Another function of VGAM1386 is therefore inhibition of Integrin, Alpha M (complement component receptor 3, alpha; also known as CD11b (p170), Macrophage Antigen Alpha Polypeptide) (ITGAM, Accession NM_000632), a gene which is involved in various adhesive interactions of monocytes, macrophages and granulocytes as well as in mediating the uptake of complement-coated particles. Accordingly, utilities of VGAM1386 include diagnosis, prevention and treatment of diseases and clinical condi-

tions associated with ITGAM. The function of ITGAM has been established by previous studies. A major surface antigen family on human leukocytes includes complement receptor type 3 (CR3A; also called integrin alpha-M, Mac1 or Mo1), lymphocyte function-associated antigen type 1 (LFA-1; 153370), and p150,95 (Leu M5; 151510). These antigens share a common beta chain (OMIM Ref. No. 116920) of 94 kD, linked noncovalently to 1 of 3 alpha chains distinctive to each. They promote adhesion of granulocytes to each other and to endothelial cell monolayers. The apparent molecular weight of the Mo1 alpha chain is 155 to 165 kD, that of the LFA1 alpha subunit is 180 kD, and that of the Leu M5 subunit is 130 to 150 kD. Pierce et al. (1986) purified human Mo1 to homogeneity from normal granulocytes by affinity chromatography and high performance liquid chromatography (HPLC) and determined the N-terminal amino acid sequence of its alpha subunit. The obtained sequence was identical, except for 2 conservative substitutions, to that of the alpha subunit of Mac1 antigen (Springer et al., 1985). Furthermore, Pierce et al. (1986) found that the N-terminal amino acid sequence of the alpha subunit of Mo1 was homologous to the alpha subunit of IIb/IIIa, a glycoprotein that serves

similar adhesive functions on platelets and is deficient or defective in Glanzmann thrombasthenia (OMIM Ref. No. 273800). Patients with a history of recurrent bacterial infections and an inherited deficiency of all 3 leukocyte membrane surface antigens are thought to have reduced or absent synthesis of the common beta subunit of the antigen family; see 116920. By Southern analysis of DNA from hamster-human hybrids, Arnaout et al. (1988) localized the human MO1A gene to chromosome 16, which has been shown to contain the gene LFA1A (OMIM Ref. No. 153370). By in situ hybridization, Corbi et al. (1988) demonstrated that the alpha subunits of LFA-1, Mac1, and p150,95 constitute a cluster that might be called leukocyte adhesion, alpha, cluster (LAAC) located on 16p13.1-p11. Callen et al. (1991) narrowed the assignment to 16p11.2. Inflammation plays an essential role in the initiation and progression of atherosclerosis. Simon et al. (2000) presented evidence that it also has a role in vascular repair after mechanical arterial injury (i.e., percutaneous transluminal coronary angioplasty, or PTCA). In animal models of vascular injury, leukocytes are recruited as a precursor to intimal thickening. Markers of leukocyte activation, in particular, increased expression of Mac1,

which is responsible for firm leukocyte adhesion to platelets and fibrinogen on denuded vessels, predict restenosis after PTCA. To determine whether Mac1-mediated leukocyte recruitment is causally related to neointimal formation, Simon et al. (2000) subjected Mac1 knockout mice to a mechanical carotid artery dilation and complete endothelial denudation. They found that the selective absence of Mac1 impaired transplatelet leukocyte migration into the vessel wall, reducing leukocyte accumulation. Diminished medial leukocyte accumulation was accompanied by markedly reduced neointimal thickening after vascular injury. These data established a role for inflammation in neointimal thickening and suggested that leukocyte recruitment to mechanically injured arteries may prevent restenosis

[48647] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[48648] Pierce, M. W.; Remold-O'Donnell, E.; Todd, R. F., III; Arnaout, M. A. : N-terminal sequence of human leukocyte glycoprotein Mo1: conservation across species and homology to platelet IIb/IIIa. *Biochim. Biophys. Acta* 874: 368-371, 1986. ; and

[48649] Arnaout, M. A.; Remold-O'Donnell, E.; Pierce, M. W.; Harris, P.; Tenen, D. G. : Molecular cloning of the alpha-subunit of human and guinea pig leukocyte adhesion glycoprotein Mo1: chromo.

[48650] Further studies establishing the function and utilities of ITGAM are found in John Hopkins OMIM database record ID 120980, and in cited publications numbered 4960–4967 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. CSR1 (Accession NM_016240) is another VGAM1386 host target gene. CSR1 BINDING SITE1 and CSR1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CSR1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CSR1 BINDING SITE1 and CSR1 BINDING SITE2, designated SEQ ID:18357 and SEQ ID:18358 respectively, to the nucleotide sequence of VGAM1386 RNA, herein designated VGAM RNA, also designated SEQ ID:4097.

[48651] Another function of VGAM1386 is therefore inhibition of CSR1 (Accession NM_016240). Accordingly, utilities of VGAM1386 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with CSR1. FLJ11618 (Accession NM_022452) is another VGAM1386 host target gene. FLJ11618 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11618, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11618 BINDING SITE, designated SEQ ID:22792, to the nucleotide sequence of VGAM1386 RNA, herein designated VGAM RNA, also designated SEQ ID:4097.

[48652] Another function of VGAM1386 is therefore inhibition of FLJ11618 (Accession NM_022452). Accordingly, utilities of VGAM1386 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11618. KIAA0914 (Accession NM_014883) is another VGAM1386 host target gene. KIAA0914 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0914, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0914 BINDING SITE, designated SEQ ID:17036, to the

nucleotide sequence of VGAM1386 RNA, herein designated VGAM RNA, also designated SEQ ID:4097.

[48653] Another function of VGAM1386 is therefore inhibition of KIAA0914 (Accession NM_014883). Accordingly, utilities of VGAM1386 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0914. MGC20255 (Accession NM_052848) is another VGAM1386 host target gene. MGC20255 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC20255, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC20255 BINDING SITE, designated SEQ ID:27427, to the nucleotide sequence of VGAM1386 RNA, herein designated VGAM RNA, also designated SEQ ID:4097.

[48654] Another function of VGAM1386 is therefore inhibition of MGC20255 (Accession NM_052848). Accordingly, utilities of VGAM1386 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC20255. LOC162461 (Accession XM_091568) is another VGAM1386 host target gene. LOC162461 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC162461, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC162461 BINDING SITE, designated SEQ ID:40057, to the nucleotide sequence of VGAM1386 RNA, herein designated VGAM RNA, also designated SEQ ID:4097.

[48655] Another function of VGAM1386 is therefore inhibition of LOC162461 (Accession XM_091568). Accordingly, utilities of VGAM1386 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC162461. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1387 (VGAM1387) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48656] VGAM1387 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1387 was detected is described hereinabove with reference to Figs. 1-8.

[48657] VGAM1387 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Himetobi P Virus.

VGAM1387 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48658] VGAM1387 gene encodes a VGAM1387 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1387 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1387 precursor RNA is designated SEQ ID:1373, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1373 is located at position 7593 relative to the genome of Himetobi P Virus.

[48659] VGAM1387 precursor RNA folds onto itself, forming VGAM1387 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48660] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1387 folded precursor RNA into VGAM1387 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM1387 RNA is designated SEQ ID:4098, and is provided hereinbelow with reference to the sequence listing part.

[48661] VGAM1387 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1387 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1387 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[48662] VGAM1387 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1387 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1387 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1387 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1387 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[48663] The complementary binding of VGAM1387 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1387 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1387

host target RNA into VGAM1387 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48664] It is appreciated that VGAM1387 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1387 host target genes. The mRNA of each one of this plurality of VGAM1387 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1387 RNA, herein designated VGAM RNA, and which when bound by VGAM1387 RNA causes inhibition of translation of respective one or more VGAM1387 host target proteins.

[48665] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1387 gene, herein designated VGAM GENE, on one or more VGAM1387 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[48666] It is yet further appreciated that a function of VGAM1387 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1387 include diagnosis, prevention and treatment of viral infection by Himetobi P Virus. Specific functions, and accordingly utilities, of VGAM1387 correlate with, and may be deduced from, the identity of the host target genes which VGAM1387 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48667] Nucleotide sequences of the VGAM1387 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1387 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1387 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1387 are further

described hereinbelow with reference to Table 1.

[48668] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1387 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1387 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48669] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1387 gene, herein designated VGAM is inhibition of expression of VGAM1387 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1387 correlate with, and may be deduced from, the identity of the target genes which VGAM1387 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[48670] B-cell CLL/lymphoma 11B (zinc finger protein) (BCL11B, Accession NM_022898) is a VGAM1387 host target gene. BCL11B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BCL11B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of BCL11B BINDING SITE, designated SEQ ID:23169, to the nucleotide sequence of VGAM1387 RNA, herein designated VGAM RNA, also designated SEQ ID:4098.

[48671] A function of VGAM1387 is therefore inhibition of B-cell CLL/lymphoma 11B (zinc finger protein) (BCL11B, Accession NM_022898). Accordingly, utilities of VGAM1387 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL11B. Stearoyl-CoA Desaturase (delta-9-desaturase) (SCD, Accession NM_005063) is another VGAM1387 host target gene. SCD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCD BINDING SITE, designated SEQ ID:11493, to the nucleotide sequence of VGAM1387 RNA, herein designated VGAM RNA, also designated SEQ ID:4098.

[48672] Another function of VGAM1387 is therefore inhibition of Stearoyl-CoA Desaturase (delta-9-desaturase) (SCD, Accession NM_005063), a gene which functions in the synthesis of unsaturated fatty acids. Accordingly, utilities of

VGAM1387 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCD. The function of SCD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM314. Transcription Factor-like 4 (TCFL4, Accession XM_032817) is another VGAM1387 host target gene. TCFL4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TCFL4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCFL4 BINDING SITE, designated SEQ ID:31768, to the nucleotide sequence of VGAM1387 RNA, herein designated VGAM RNA, also designated SEQ ID:4098.

[48673] Another function of VGAM1387 is therefore inhibition of Transcription Factor-like 4 (TCFL4, Accession XM_032817), a gene which interacts with Mad and represses transcription by recruiting the Sin3A-histone deacetylase corepressor complex. Accordingly, utilities of VGAM1387 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCFL4.

The function of TCFL4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM172. Wingless-type MMTV Integration Site Family, Member 5A (WNT5A, Accession NM_003392) is another VGAM1387 host target gene. WNT5A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by WNT5A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WNT5A BINDING SITE, designated SEQ ID:9430, to the nucleotide sequence of VGAM1387 RNA, herein designated VGAM RNA, also designated SEQ ID:4098.

[48674] Another function of VGAM1387 is therefore inhibition of Wingless-type MMTV Integration Site Family, Member 5A (WNT5A, Accession NM_003392), a gene which is a ligand for members of the frizzled family of seven transmembrane receptors and is probably a developmental protein. Accordingly, utilities of VGAM1387 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WNT5A. The function of WNT5A and its association with various diseases and clinical con-

ditions, has been established by previous studies, as described hereinabove with reference to VGAM996. Zinc Finger Protein 161 (ZNF161, Accession NM_007146) is another VGAM1387 host target gene. ZNF161 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF161, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF161 BINDING SITE, designated SEQ ID:13997, to the nucleotide sequence of VGAM1387 RNA, herein designated VGAM RNA, also designated SEQ ID:4098.

[48675] Another function of VGAM1387 is therefore inhibition of Zinc Finger Protein 161 (ZNF161, Accession NM_007146). Accordingly, utilities of VGAM1387 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF161. Basic Leucine Zipper and W2 Domains 1 (BZW1, Accession NM_014670) is another VGAM1387 host target gene. BZW1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BZW1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of BZW1 BINDING SITE, designated SEQ ID:16128, to the nucleotide sequence of VGAM1387 RNA, herein designated VGAM RNA, also designated SEQ ID:4098.

[48676] Another function of VGAM1387 is therefore inhibition of Basic Leucine Zipper and W2 Domains 1 (BZW1, Accession NM_014670). Accordingly, utilities of VGAM1387 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BZW1. Cysteine and Histidine-rich Domain (CHORD)-containing, Zinc Binding Protein 1 (CHORDC1, Accession NM_012124) is another VGAM1387 host target gene. CHORDC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CHORDC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHORDC1 BINDING SITE, designated SEQ ID:14436, to the nucleotide sequence of VGAM1387 RNA, herein designated VGAM RNA, also designated SEQ ID:4098.

[48677] Another function of VGAM1387 is therefore inhibition of Cysteine and Histidine-rich Domain (CHORD)-containing, Zinc Binding Protein 1 (CHORDC1, Accession NM_012124).

Accordingly, utilities of VGAM1387 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHORDC1. DKFZP434A043 (Accession NM_015396) is another VGAM1387 host target gene. DKFZP434A043 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434A043, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434A043 BINDING SITE, designated SEQ ID:17699, to the nucleotide sequence of VGAM1387 RNA, herein designated VGAM RNA, also designated SEQ ID:4098.

[48678] Another function of VGAM1387 is therefore inhibition of DKFZP434A043 (Accession NM_015396). Accordingly, utilities of VGAM1387 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434A043. DKFZP434L0718 (Accession NM_032139) is another VGAM1387 host target gene. DKFZP434L0718 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434L0718, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BIND-

ING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434L0718 BINDING SITE, designated SEQ ID:25821, to the nucleotide sequence of VGAM1387 RNA, herein designated VGAM RNA, also designated SEQ ID:4098.

[48679] Another function of VGAM1387 is therefore inhibition of DKFZP434L0718 (Accession NM_032139). Accordingly, utilities of VGAM1387 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434L0718. FLJ11827 (Accession NM_025093) is another VGAM1387 host target gene. FLJ11827 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11827, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11827 BINDING SITE, designated SEQ ID:24721, to the nucleotide sequence of VGAM1387 RNA, herein designated VGAM RNA, also designated SEQ ID:4098.

[48680] Another function of VGAM1387 is therefore inhibition of FLJ11827 (Accession NM_025093). Accordingly, utilities of VGAM1387 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ11827. FLJ22944 (Accession NM_025145) is another VGAM1387 host target gene. FLJ22944 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22944, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22944 BINDING SITE, designated SEQ ID:24781, to the nucleotide sequence of VGAM1387 RNA, herein designated VGAM RNA, also designated SEQ ID:4098.

[48681] Another function of VGAM1387 is therefore inhibition of FLJ22944 (Accession NM_025145). Accordingly, utilities of VGAM1387 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22944. KIAA1371 (Accession XM_114371) is another VGAM1387 host target gene. KIAA1371 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1371, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1371 BINDING SITE, designated SEQ ID:42908, to the nucleotide sequence of VGAM1387 RNA, herein design-

nated VGAM RNA, also designated SEQ ID:4098.

[48682] Another function of VGAM1387 is therefore inhibition of KIAA1371 (Accession XM_114371). Accordingly, utilities of VGAM1387 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1371. KIAA1755 (Accession XM_028810) is another VGAM1387 host target gene. KIAA1755 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1755, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1755 BINDING SITE, designated SEQ ID:30747, to the nucleotide sequence of VGAM1387 RNA, herein designated VGAM RNA, also designated SEQ ID:4098.

[48683] Another function of VGAM1387 is therefore inhibition of KIAA1755 (Accession XM_028810). Accordingly, utilities of VGAM1387 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1755. KIAA1795 (Accession XM_050988) is another VGAM1387 host target gene. KIAA1795 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1795, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1795 BINDING SITE, designated SEQ ID:35699, to the nucleotide sequence of VGAM1387 RNA, herein designated VGAM RNA, also designated SEQ ID:4098.

[48684] Another function of VGAM1387 is therefore inhibition of KIAA1795 (Accession XM_050988). Accordingly, utilities of VGAM1387 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1795. RNAHP (Accession NM_007372) is another VGAM1387 host target gene. RNAHP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RNAHP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNAHP BINDING SITE, designated SEQ ID:14299, to the nucleotide sequence of VGAM1387 RNA, herein designated VGAM RNA, also designated SEQ ID:4098.

[48685] Another function of VGAM1387 is therefore inhibition of RNAHP (Accession NM_007372). Accordingly, utilities of VGAM1387 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with RNAHP. Solute Carrier Family 26, Member 7 (SLC26A7, Accession NM_052832) is another VGAM1387 host target gene. SLC26A7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC26A7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC26A7 BINDING SITE, designated SEQ ID:27411, to the nucleotide sequence of VGAM1387 RNA, herein designated VGAM RNA, also designated SEQ ID:4098.

[48686] Another function of VGAM1387 is therefore inhibition of Solute Carrier Family 26, Member 7 (SLC26A7, Accession NM_052832). Accordingly, utilities of VGAM1387 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC26A7. Zinc Finger, DHHC Domain Containing 5 (ZDHHC5, Accession XM_166204) is another VGAM1387 host target gene. ZDHHC5 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ZDHHC5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of ZDHHC5 BINDING SITE, designated SEQ ID:44008, to the nucleotide sequence of VGAM1387 RNA, herein designated VGAM RNA, also designated SEQ ID:4098.

[48687] Another function of VGAM1387 is therefore inhibition of Zinc Finger, DHHC Domain Containing 5 (ZDHHC5, Accession XM_166204). Accordingly, utilities of VGAM1387 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZDHHC5. LOC145098 (Accession XM_085022) is another VGAM1387 host target gene. LOC145098 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145098, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145098 BINDING SITE, designated SEQ ID:37795, to the nucleotide sequence of VGAM1387 RNA, herein designated VGAM RNA, also designated SEQ ID:4098.

[48688] Another function of VGAM1387 is therefore inhibition of LOC145098 (Accession XM_085022). Accordingly, utilities of VGAM1387 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC145098. LOC146795 (Accession XM_085593) is another VGAM1387 host target gene. LOC146795 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC146795, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146795 BINDING SITE, designated SEQ ID:38242, to the nucleotide sequence of VGAM1387 RNA, herein designated VGAM RNA, also designated SEQ ID:4098.

[48689] Another function of VGAM1387 is therefore inhibition of LOC146795 (Accession XM_085593). Accordingly, utilities of VGAM1387 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146795. LOC148266 (Accession XM_086128) is another VGAM1387 host target gene. LOC148266 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC148266, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148266 BINDING SITE, designated SEQ ID:38514, to

the nucleotide sequence of VGAM1387 RNA, herein designated VGAM RNA, also designated SEQ ID:4098.

[48690] Another function of VGAM1387 is therefore inhibition of LOC148266 (Accession XM_086128). Accordingly, utilities of VGAM1387 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148266. LOC151579 (Accession XM_045290) is another VGAM1387 host target gene. LOC151579 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151579, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151579 BINDING SITE, designated SEQ ID:34422, to the nucleotide sequence of VGAM1387 RNA, herein designated VGAM RNA, also designated SEQ ID:4098.

[48691] Another function of VGAM1387 is therefore inhibition of LOC151579 (Accession XM_045290). Accordingly, utilities of VGAM1387 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151579. LOC152620 (Accession XM_011108) is another VGAM1387 host target gene. LOC152620 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC152620, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152620 BINDING SITE, designated SEQ ID:30174, to the nucleotide sequence of VGAM1387 RNA, herein designated VGAM RNA, also designated SEQ ID:4098.

[48692] Another function of VGAM1387 is therefore inhibition of LOC152620 (Accession XM_011108). Accordingly, utilities of VGAM1387 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152620. LOC199907 (Accession XM_114051) is another VGAM1387 host target gene. LOC199907 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC199907, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199907 BINDING SITE, designated SEQ ID:42657, to the nucleotide sequence of VGAM1387 RNA, herein designated VGAM RNA, also designated SEQ ID:4098.

[48693] Another function of VGAM1387 is therefore inhibition of LOC199907 (Accession XM_114051). Accordingly, utilities

of VGAM1387 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199907. LOC255565 (Accession XM_170811) is another VGAM1387 host target gene. LOC255565 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255565, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255565 BINDING SITE, designated SEQ ID:45591, to the nucleotide sequence of VGAM1387 RNA, herein designated VGAM RNA, also designated SEQ ID:4098.

[48694] Another function of VGAM1387 is therefore inhibition of LOC255565 (Accession XM_170811). Accordingly, utilities of VGAM1387 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255565. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1388 (VGAM1388) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48695] VGAM1388 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1388 was detected is described hereinabove with reference to Figs. 1–8.

[48696] VGAM1388 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cercopithecine Herpesvirus 7. VGAM1388 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48697] VGAM1388 gene encodes a VGAM1388 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1388 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1388 precursor RNA is designated SEQ ID:1374, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1374 is located at position 58541 relative to the genome of Cercopithecine Herpesvirus 7.

[48698] VGAM1388 precursor RNA folds onto itself, forming VGAM1388 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48699] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1388 folded precursor RNA into VGAM1388 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM1388 RNA is designated SEQ ID:4099, and is provided hereinbelow with reference to the sequence listing part.

[48700] VGAM1388 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1388 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1388 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[48701] VGAM1388 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1388 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1388 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1388 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1388 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[48702] The complementary binding of VGAM1388 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1388 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1388 host target RNA into VGAM1388 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48703] It is appreciated that VGAM1388 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1388 host target genes. The mRNA of each one of this plurality of VGAM1388 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1388 RNA, herein designated VGAM RNA, and which when bound by VGAM1388 RNA causes inhibition of translation of respective one or more VGAM1388 host target proteins.

[48704] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1388 gene, herein designated VGAM GENE, on one or more VGAM1388 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[48705] It is yet further appreciated that a function of VGAM1388 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1388 include diagnosis, prevention and treatment of viral infection by Cercopithecine Herpesvirus 7. Specific functions, and accordingly utilities, of VGAM1388 correlate with, and may be deduced from, the identity of the host target genes which VGAM1388 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48706] Nucleotide sequences of the VGAM1388 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the
`diced` VGAM1388 RNA, herein designated VGAM RNA,
and a schematic representation of the secondary folding
of VGAM1388 folded precursor RNA, herein designated
VGAM FOLDED PRECURSOR RNA, of VGAM1388 are further
described hereinbelow with reference to Table 1.

[48707] Nucleotide sequences of host target binding sites, such as
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of
Fig. 1, found on VGAM1388 host target RNA, and
schematic representation of the complementarity of each
of these host target binding sites to VGAM1388 RNA,
herein designated VGAM RNA, are described hereinbelow
with reference to Table 2.

[48708] As mentioned hereinabove with reference to Fig. 1, a
function of VGAM1388 gene, herein designated VGAM is
inhibition of expression of VGAM1388 target genes. It is
appreciated that specific functions, and accordingly utili-
ties, of VGAM1388 correlate with, and may be deduced
from, the identity of the target genes which VGAM1388
binds and inhibits, and the function of these target genes,
as elaborated hereinbelow.

[48709] DXS1283E (Accession XM_047871) is a VGAM1388 host
target gene. DXS1283E BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by DXS1283E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DXS1283E BINDING SITE, designated SEQ ID:35060, to the nucleotide sequence of VGAM1388 RNA, herein designated VGAM RNA, also designated SEQ ID:4099.

[48710] A function of VGAM1388 is therefore inhibition of DXS1283E (Accession XM_047871). Accordingly, utilities of VGAM1388 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DXS1283E. TOPBP1 (Accession NM_007027) is another VGAM1388 host target gene. TOPBP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TOPBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TOPBP1 BINDING SITE, designated SEQ ID:13885, to the nucleotide sequence of VGAM1388 RNA, herein designated VGAM RNA, also designated SEQ ID:4099.

[48711] Another function of VGAM1388 is therefore inhibition of

TOPBP1 (Accession NM_007027). Accordingly, utilities of VGAM1388 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TOPBP1. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1389 (VGAM1389) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48712] VGAM1389 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1389 was detected is described hereinabove with reference to Figs. 1-8.

[48713] VGAM1389 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cercopithecine Herpesvirus 7. VGAM1389 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48714] VGAM1389 gene encodes a VGAM1389 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1389 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1389 precursor RNA is designated SEQ ID:1375, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1375 is located at position 56184 relative to the genome of Cercopithecine Herpesvirus 7.

- [48715] VGAM1389 precursor RNA folds onto itself, forming VGAM1389 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [48716] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1389 folded precursor RNA into VGAM1389 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide se-

quence of VGAM1389 RNA is designated SEQ ID:4100, and is provided hereinbelow with reference to the sequence listing part.

[48717] VGAM1389 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1389 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1389 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[48718] VGAM1389 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1389 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1389 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM1389 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1389 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[48719] The complementary binding of VGAM1389 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1389 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1389 host target RNA into VGAM1389 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48720] It is appreciated that VGAM1389 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1389 host target genes. The mRNA of each one of this plurality of VGAM1389 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1389 RNA, herein designated VGAM RNA, and which when bound by VGAM1389 RNA causes inhibition of translation of respective one or more VGAM1389 host target proteins.

[48721] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1389 gene, herein designated VGAM GENE, on one or more VGAM1389 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[48722] It is yet further appreciated that a function of VGAM1389

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1389 include diagnosis, prevention and treatment of viral infection by Cercopithecine Herpesvirus 7. Specific functions, and accordingly utilities, of VGAM1389 correlate with, and may be deduced from, the identity of the host target genes which VGAM1389 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48723] Nucleotide sequences of the VGAM1389 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1389 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1389 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1389 are further described hereinbelow with reference to Table 1.

[48724] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1389 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1389 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48725] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1389 gene, herein designated VGAM is inhibition of expression of VGAM1389 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1389 correlate with, and may be deduced from, the identity of the target genes which VGAM1389 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[48726] Down Syndrome Critical Region Gene 3 (DSCR3, Accession NM_006052) is a VGAM1389 host target gene. DSCR3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DSCR3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DSCR3 BINDING SITE, designated SEQ ID:12683, to the nucleotide sequence of VGAM1389 RNA, herein designated VGAM RNA, also designated SEQ ID:4100.

[48727] A function of VGAM1389 is therefore inhibition of Down Syndrome Critical Region Gene 3 (DSCR3, Accession NM_006052). Accordingly, utilities of VGAM1389 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DSCR3. Mannosyl

(alpha-1,6-)-glycoprotein Beta-1,6-N-acetyl-glucosaminyltransferase (MGAT5, Accession NM_002410) is another VGAM1389 host target gene. MGAT5 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGAT5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGAT5 BINDING SITE, designated SEQ ID:8236, to the nucleotide sequence of VGAM1389 RNA, herein designated VGAM RNA, also designated SEQ ID:4100.

[48728] Another function of VGAM1389 is therefore inhibition of Mannosyl (alpha-1,6-)-glycoprotein Beta-1,6-N-acetyl-glucosaminyltransferase (MGAT5, Accession NM_002410). Accordingly, utilities of VGAM1389 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGAT5. Phosphoinositide-3-kinase, Catalytic, Gamma Polypeptide (PIK3CG, Accession NM_002649) is another VGAM1389 host target gene. PIK3CG BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PIK3CG, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIK3CG BINDING SITE, designated SEQ ID:8511, to the nucleotide sequence of VGAM1389 RNA, herein designated VGAM RNA, also designated SEQ ID:4100.

[48729] Another function of VGAM1389 is therefore inhibition of Phosphoinositide-3-kinase, Catalytic, Gamma Polypeptide (PIK3CG, Accession NM_002649), a gene which regulating cell growth. Accordingly, utilities of VGAM1389 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIK3CG. The function of PIK3CG has been established by previous studies. Phosphatidylinositol 3-kinase (PIK3) activity is implicated in diverse cellular responses triggered by mammalian cell surface receptors. Stoyanov et al. (1995) noted that receptors with tyrosine kinase activity recruit heterodimeric PIK3 kinases composed of a p110 catalytic subunit and a p85 adaptor subunit (OMIM Ref. No. 171833). Stoyanov et al. (1995) screened a human bone marrow cDNA library with primers based on the sequences of yeast and bovine PIK3 p110 subunits. They isolated a human cDNA for a novel p110 subunit, which they termed p110-gamma. The

cDNA encodes a predicted 120-kD, 1,050-amino acid polypeptide with 36% identity to human p110- α (OMIM Ref. No. 171834). The 5.3-kb p110- α transcript was detectable by Northern blot in human pancreas, skeletal muscle, liver, and heart. Stoyanov et al. (1995) found that recombinant p110- γ did not interact with the p85 subunit in vivo, in contrast to recombinant p110- α . The transducin G protein subunits G- β (t) (OMIM Ref. No. 189974)/G- γ (t) (OMIM Ref. No. 189970) did, however, activate p110- γ in vitro, and the stimulation was suppressed by G- α (t)-GDP (OMIM Ref. No. 139330); G- α (t)-GDP could stimulate p110- γ only in the presence of AlF(4-). In contrast, the p85-dependent p110- α was not similarly affected by the G protein subunits. Stoyanov et al. (1995) speculated that the p110- γ isotype may link signaling through G protein-coupled receptors and generate phosphoinositide second messengers phosphorylated in the D-3 position. Animal model experiments lend further support to the function of PI3K- γ . Hirsch et al. (2000), Sasaki et al. (2000), and Li et al. (2000) each independently developed mice deficient in PI3K- γ by targeted disruption. PI3K- γ -/- mice were viable and had fully dif-

ferentiated neutrophils and macrophages. Chemoattractant-stimulated PI3K-gamma $-/-$ neutrophils did not produce phosphatidylinositol 3,4,5-triphosphate, did not activate protein kinase B, and displayed impaired respiratory burst and motility. Peritoneal PI3K-gamma-null macrophages showed a reduced migration toward a wide range of chemotactic stimuli and a severely defective accumulation in a septic peritonitis model, as shown by Hirsch et al. (2000). These results demonstrated that PI3K-gamma is a crucial signaling molecule required for macrophage accumulation in inflammation. Sasaki et al. (2000) demonstrated that PI3K-gamma controls thymocyte survival and activation of mature T cells, but has no role in the development or function of B cells.

PI3K-gamma-deficient neutrophils exhibited severe defects in migration and respiratory burst in response to G protein-coupled receptor agonists and chemotactic agents. PI3K-gamma links G protein-coupled receptor stimulation to the formation of phosphatidylinositol 3,4,5-triphosphate and the activation of protein kinase B, ribosomal protein S6 kinase (see OMIM Ref. No. 300075), and extracellular signal-regulated kinases 1 (OMIM Ref. No. 601795) and 2. Thus, Sasaki et al. (2000) concluded

that PI3K-gamma regulates thymocyte development, T-cell activation, neutrophil migration, and the oxidative burst. Li et al. (2000) reported similar results and also found that PI3K-gamma has an important role in chemoattractant-induced superoxide production and chemotaxis and in the production of T cell-independent antigen-specific antibodies composed of the immunoglobulin-gamma light chain

[48730] It is appreciated that the abovementioned animal model for PIK3CG is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[48731] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[48732] Stoyanov, B.; Volinia, S.; Hanck, T.; Rubio, I.; Loubtchenkov, M.; Malek, D.; Stoyanova, S.; Vanhaesebroeck, B.; Dhand, R.; Nurnberg, B.; Gierschik, P.; Seedorf, K.; Hsuan, J. J.; Waterfield, M. D.; Wetzker, R. : Cloning and characterization of a G protein-activated human phosphoinositide-3 kinase. Science 269: 690-693, 1995. ; and

[48733] Li, Z.; Jiang, H.; Xie, W.; Zhang, Z.; Smrcka, A. V.; Wu, D. : Roles of PLC-beta-2 and -beta-3 and PI3K-gamma in

chemoattractant-mediated signal transduction. Science 287: 1046-1049, 2000.

[48734] Further studies establishing the function and utilities of PIK3CG are found in John Hopkins OMIM database record ID 601232, and in cited publications numbered 9852-9855, 6842, 786 and 10854-2833 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. FLJ13449 (Accession NM_024546) is another VGAM1389 host target gene. FLJ13449 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13449, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13449 BINDING SITE, designated SEQ ID:23759, to the nucleotide sequence of VGAM1389 RNA, herein designated VGAM RNA, also designated SEQ ID:4100.

[48735] Another function of VGAM1389 is therefore inhibition of FLJ13449 (Accession NM_024546). Accordingly, utilities of VGAM1389 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13449. KIAA1025 (Accession XM_034056) is another VGAM1389 host target gene. KIAA1025 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1025, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1025 BINDING SITE, designated SEQ ID:31995, to the nucleotide sequence of VGAM1389 RNA, herein designated VGAM RNA, also designated SEQ ID:4100.

[48736] Another function of VGAM1389 is therefore inhibition of KIAA1025 (Accession XM_034056). Accordingly, utilities of VGAM1389 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1025. Protocadherin 17 (PCDH17, Accession NM_014459) is another VGAM1389 host target gene. PCDH17 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PCDH17, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDH17 BINDING SITE, designated SEQ ID:15811, to the nucleotide sequence of VGAM1389 RNA, herein designated VGAM RNA, also designated SEQ ID:4100.

[48737] Another function of VGAM1389 is therefore inhibition of Protocadherin 17 (PCDH17, Accession NM_014459). Accordingly, utilities of VGAM1389 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH17. Zinc Finger Protein 384 (ZNF384, Accession NM_133476) is another VGAM1389 host target gene. ZNF384 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF384, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF384 BINDING SITE, designated SEQ ID:28542, to the nucleotide sequence of VGAM1389 RNA, herein designated VGAM RNA, also designated SEQ ID:4100.

[48738] Another function of VGAM1389 is therefore inhibition of Zinc Finger Protein 384 (ZNF384, Accession NM_133476). Accordingly, utilities of VGAM1389 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF384. LOC166042 (Accession XM_093623) is another VGAM1389 host target gene. LOC166042 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by

LOC166042, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC166042 BINDING SITE, designated SEQ ID:40199, to the nucleotide sequence of VGAM1389 RNA, herein designated VGAM RNA, also designated SEQ ID:4100.

[48739] Another function of VGAM1389 is therefore inhibition of LOC166042 (Accession XM_093623). Accordingly, utilities of VGAM1389 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC166042. LOC222662 (Accession XM_167086) is another VGAM1389 host target gene. LOC222662 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC222662, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222662 BINDING SITE, designated SEQ ID:44601, to the nucleotide sequence of VGAM1389 RNA, herein designated VGAM RNA, also designated SEQ ID:4100.

[48740] Another function of VGAM1389 is therefore inhibition of LOC222662 (Accession XM_167086). Accordingly, utilities

of VGAM1389 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222662. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1390 (VGAM1390) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48741] VGAM1390 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1390 was detected is described hereinabove with reference to Figs. 1-8.

[48742] VGAM1390 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cercopithecine Herpesvirus 7. VGAM1390 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48743] VGAM1390 gene encodes a VGAM1390 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1390 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM1390 precursor RNA is designated SEQ ID:1376, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1376 is located at position 57196 relative to the genome of Cercopithecine Herpesvirus 7.

- [48744] VGAM1390 precursor RNA folds onto itself, forming VGAM1390 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [48745] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1390 folded precursor RNA into VGAM1390 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1390 RNA is designated SEQ ID:4101, and

is provided hereinbelow with reference to the sequence listing part.

[48746] VGAM1390 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1390 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1390 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[48747] VGAM1390 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1390 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1390 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM1390 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1390 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[48748] The complementary binding of VGAM1390 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1390 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1390 host target RNA into VGAM1390 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48749] It is appreciated that VGAM1390 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1390 host target genes. The mRNA of each one of this plurality of VGAM1390 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com–

plementary to VGAM1390 RNA, herein designated VGAM RNA, and which when bound by VGAM1390 RNA causes inhibition of translation of respective one or more VGAM1390 host target proteins.

[48750] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1390 gene, herein designated VGAM GENE, on one or more VGAM1390 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[48751] It is yet further appreciated that a function of VGAM1390 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1390 include diagnosis, prevention and treatment of viral infection by Cercopithecine Herpesvirus 7. Specific functions, and accordingly utilities, of VGAM1390 correlate with, and may be deduced from, the identity of the host target genes which VGAM1390 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48752] Nucleotide sequences of the VGAM1390 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1390 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1390 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1390 are further described hereinbelow with reference to Table 1.

[48753] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1390 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1390 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48754] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM1390 gene, herein designated VGAM is inhibition of expression of VGAM1390 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1390 correlate with, and may be deduced from, the identity of the target genes which VGAM1390 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[48755] Calumenin (CALU, Accession NM_001219) is a VGAM1390 host target gene. CALU BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CALU, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CALU BINDING SITE, designated SEQ ID:6886, to the nucleotide sequence of VGAM1390 RNA, herein designated VGAM RNA, also designated SEQ ID:4101.

[48756] A function of VGAM1390 is therefore inhibition of Calumenin (CALU, Accession NM_001219), a gene which binds 7 calcium ions with a low affinity with unidentified function. Accordingly, utilities of VGAM1390 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CALU. The function of CALU and its

association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM253. Eukaryotic Translation Initiation Factor 2- α Kinase 3 (EIF2AK3, Accession NM_004836) is another VGAM1390 host target gene. EIF2AK3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EIF2AK3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EIF2AK3 BINDING SITE, designated SEQ ID:11245, to the nucleotide sequence of VGAM1390 RNA, herein designated VGAM RNA, also designated SEQ ID:4101.

[48757] Another function of VGAM1390 is therefore inhibition of Eukaryotic Translation Initiation Factor 2- α Kinase 3 (EIF2AK3, Accession NM_004836). Accordingly, utilities of VGAM1390 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EIF2AK3. Peroxisomal Biogenesis Factor 3 (PEX3, Accession NM_003630) is another VGAM1390 host target gene. PEX3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PEX3,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PEX3 BINDING SITE, designated SEQ ID:9691, to the nucleotide sequence of VGAM1390 RNA, herein designated VGAM RNA, also designated SEQ ID:4101.

[48758] Another function of VGAM1390 is therefore inhibition of Peroxisomal Biogenesis Factor 3 (PEX3, Accession NM_003630). Accordingly, utilities of VGAM1390 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PEX3. Single-minded Homolog 1 (Drosophila) (SIM1, Accession NM_005068) is another VGAM1390 host target gene. SIM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SIM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIM1 BINDING SITE, designated SEQ ID:11509, to the nucleotide sequence of VGAM1390 RNA, herein designated VGAM RNA, also designated SEQ ID:4101.

[48759] Another function of VGAM1390 is therefore inhibition of Single-minded Homolog 1 (Drosophila) (SIM1, Accession

NM_005068), a gene which may have pleiotropic effects during embryogenesis and in the adult. Accordingly, utilities of VGAM1390 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIM1. The function of SIM1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM665. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1391 (VGAM1391) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48760] VGAM1391 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1391 was detected is described hereinabove with reference to Figs. 1–8.

[48761] VGAM1391 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Wheat Streak Mosaic Virus. VGAM1391 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48762] VGAM1391 gene encodes a VGAM1391 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1391 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1391 precursor RNA is designated SEQ ID:1377, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1377 is located at position 6460 relative to the genome of Wheat Streak Mosaic Virus.

[48763] VGAM1391 precursor RNA folds onto itself, forming VGAM1391 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48764] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1391 folded precursor RNA into VGAM1391 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM1391 RNA is designated SEQ ID:4102, and is provided hereinbelow with reference to the sequence listing part.

[48765] VGAM1391 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1391 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1391 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[48766] VGAM1391 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1391 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1391 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1391 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1391 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[48767] The complementary binding of VGAM1391 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1391 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1391 host target RNA into VGAM1391 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48768] It is appreciated that VGAM1391 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1391 host target genes. The mRNA of each one of this plurality of VGAM1391 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1391 RNA, herein designated VGAM RNA, and which when bound by VGAM1391 RNA causes inhibition of translation of respective one or more VGAM1391 host target proteins.

[48769] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1391 gene, herein designated VGAM GENE, on one or more VGAM1391 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,
`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[48770] It is yet further appreciated that a function of VGAM1391 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1391 include diagnosis, prevention and treatment of viral infection by Wheat Streak Mosaic Virus. Specific functions, and accordingly utilities, of VGAM1391 correlate with, and may be deduced from, the identity of the host target genes which VGAM1391 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48771] Nucleotide sequences of the VGAM1391 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1391 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1391 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1391 are further described hereinbelow with reference to Table 1.

[48772] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1391 host target RNA, and

schematic representation of the complementarity of each of these host target binding sites to VGAM1391 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48773] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1391 gene, herein designated VGAM is inhibition of expression of VGAM1391 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1391 correlate with, and may be deduced from, the identity of the target genes which VGAM1391 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[48774] ATP-binding Cassette, Sub-family D (ALD), Member 2 (ABCD2, Accession NM_005164) is a VGAM1391 host target gene. ABCD2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ABCD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCD2 BINDING SITE, designated SEQ ID:11659, to the nucleotide sequence of VGAM1391 RNA, herein designated VGAM RNA, also designated SEQ ID:4102.

[48775] A function of VGAM1391 is therefore inhibition of ATP-binding Cassette, Sub-family D (ALD), Member 2 (ABCD2, Accession NM_005164), a gene which probable transporter. Accordingly, utilities of VGAM1391 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCD2. The function of ABCD2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM229.RAD51-like 1 (*S. cerevisiae*) (RAD51L1, Accession NM_133509) is another VGAM1391 host target gene. RAD51L1 BINDING SITE1 and RAD51L1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by RAD51L1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAD51L1 BINDING SITE1 and RAD51L1 BINDING SITE2, designated SEQ ID:28576 and SEQ ID:8787 respectively, to the nucleotide sequence of VGAM1391 RNA, herein designated VGAM RNA, also designated SEQ ID:4102.

[48776] Another function of VGAM1391 is therefore inhibition of RAD51-like 1 (*S. cerevisiae*) (RAD51L1, Accession

NM_133509), a gene which is a member of the RAD51 family of strand-transfer proteins. Accordingly, utilities of VGAM1391 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAD51L1. The function of RAD51L1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1020.DKFZP434C212 (Accession XM_044196) is another VGAM1391 host target gene. DKFZP434C212 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434C212, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434C212 BINDING SITE, designated SEQ ID:34170, to the nucleotide sequence of VGAM1391 RNA, herein designated VGAM RNA, also designated SEQ ID:4102.

[48777] Another function of VGAM1391 is therefore inhibition of DKFZP434C212 (Accession XM_044196). Accordingly, utilities of VGAM1391 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434C212. DKFZP566J091 (Accession

NM_030915) is another VGAM1391 host target gene. DKFZP566J091 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP566J091, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP566J091 BINDING SITE, designated SEQ ID:25184, to the nucleotide sequence of VGAM1391 RNA, herein designated VGAM RNA, also designated SEQ ID:4102.

[48778] Another function of VGAM1391 is therefore inhibition of DKFZP566J091 (Accession NM_030915). Accordingly, utilities of VGAM1391 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP566J091. FLJ22419 (Accession NM_024697) is another VGAM1391 host target gene. FLJ22419 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ22419, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22419 BINDING SITE, designated SEQ ID:24006, to the nucleotide sequence of VGAM1391 RNA, herein design-

nated VGAM RNA, also designated SEQ ID:4102.

[48779] Another function of VGAM1391 is therefore inhibition of FLJ22419 (Accession NM_024697). Accordingly, utilities of VGAM1391 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22419. HSPC055 (Accession NM_014153) is another VGAM1391 host target gene. HSPC055 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HSPC055, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPC055 BINDING SITE, designated SEQ ID:15436, to the nucleotide sequence of VGAM1391 RNA, herein designated VGAM RNA, also designated SEQ ID:4102.

[48780] Another function of VGAM1391 is therefore inhibition of HSPC055 (Accession NM_014153). Accordingly, utilities of VGAM1391 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPC055. IL-17RE (Accession NM_144640) is another VGAM1391 host target gene. IL-17RE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL-17RE, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL-17RE BINDING SITE, designated SEQ ID:29464, to the nucleotide sequence of VGAM1391 RNA, herein designated VGAM RNA, also designated SEQ ID:4102.

[48781] Another function of VGAM1391 is therefore inhibition of IL-17RE (Accession NM_144640). Accordingly, utilities of VGAM1391 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL-17RE. KIAA0057 (Accession NM_012288) is another VGAM1391 host target gene. KIAA0057 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0057, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0057 BINDING SITE, designated SEQ ID:14619, to the nucleotide sequence of VGAM1391 RNA, herein designated VGAM RNA, also designated SEQ ID:4102.

[48782] Another function of VGAM1391 is therefore inhibition of KIAA0057 (Accession NM_012288). Accordingly, utilities of VGAM1391 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA0057. KIAA0447 (Accession XM_049733) is another VGAM1391 host target gene. KIAA0447 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0447, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0447 BINDING SITE, designated SEQ ID:35493, to the nucleotide sequence of VGAM1391 RNA, herein designated VGAM RNA, also designated SEQ ID:4102.

[48783] Another function of VGAM1391 is therefore inhibition of KIAA0447 (Accession XM_049733). Accordingly, utilities of VGAM1391 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0447. KIAA1855 (Accession XM_166453) is another VGAM1391 host target gene. KIAA1855 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1855, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1855 BINDING SITE, designated SEQ ID:44350, to the

nucleotide sequence of VGAM1391 RNA, herein designated VGAM RNA, also designated SEQ ID:4102.

[48784] Another function of VGAM1391 is therefore inhibition of KIAA1855 (Accession XM_166453). Accordingly, utilities of VGAM1391 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1855. KIAA1871 (Accession XM_028409) is another VGAM1391 host target gene. KIAA1871 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1871, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1871 BINDING SITE, designated SEQ ID:30703, to the nucleotide sequence of VGAM1391 RNA, herein designated VGAM RNA, also designated SEQ ID:4102.

[48785] Another function of VGAM1391 is therefore inhibition of KIAA1871 (Accession XM_028409). Accordingly, utilities of VGAM1391 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1871. MGC32104 (Accession NM_144684) is another VGAM1391 host target gene. MGC32104 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by MGC32104, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC32104 BINDING SITE, designated SEQ ID:29503, to the nucleotide sequence of VGAM1391 RNA, herein designated VGAM RNA, also designated SEQ ID:4102.

[48786] Another function of VGAM1391 is therefore inhibition of MGC32104 (Accession NM_144684). Accordingly, utilities of VGAM1391 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC32104. RPH3A (Accession NM_014954) is another VGAM1391 host target gene. RPH3A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RPH3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RPH3A BINDING SITE, designated SEQ ID:17308, to the nucleotide sequence of VGAM1391 RNA, herein designated VGAM RNA, also designated SEQ ID:4102.

[48787] Another function of VGAM1391 is therefore inhibition of RPH3A (Accession NM_014954). Accordingly, utilities of

VGAM1391 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPH3A. LOC121838 (Accession XM_071772) is another VGAM1391 host target gene. LOC121838 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC121838, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC121838 BINDING SITE, designated SEQ ID:37416, to the nucleotide sequence of VGAM1391 RNA, herein designated VGAM RNA, also designated SEQ ID:4102.

[48788] Another function of VGAM1391 is therefore inhibition of LOC121838 (Accession XM_071772). Accordingly, utilities of VGAM1391 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC121838. LOC145980 (Accession XM_096914) is another VGAM1391 host target gene. LOC145980 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC145980, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC145980 BINDING SITE, designated SEQ ID:40648, to the nucleotide sequence of VGAM1391 RNA, herein designated VGAM RNA, also designated SEQ ID:4102.

[48789] Another function of VGAM1391 is therefore inhibition of LOC145980 (Accession XM_096914). Accordingly, utilities of VGAM1391 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145980. LOC149703 (Accession XM_097719) is another VGAM1391 host target gene. LOC149703 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149703, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149703 BINDING SITE, designated SEQ ID:41062, to the nucleotide sequence of VGAM1391 RNA, herein designated VGAM RNA, also designated SEQ ID:4102.

[48790] Another function of VGAM1391 is therefore inhibition of LOC149703 (Accession XM_097719). Accordingly, utilities of VGAM1391 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149703. LOC170395 (Accession XM_084325) is another VGAM1391 host target gene. LOC170395 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC170395, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC170395 BINDING SITE, designated SEQ ID:37545, to the nucleotide sequence of VGAM1391 RNA, herein designated VGAM RNA, also designated SEQ ID:4102.

[48791] Another function of VGAM1391 is therefore inhibition of LOC170395 (Accession XM_084325). Accordingly, utilities of VGAM1391 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC170395. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1392 (VGAM1392) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48792] VGAM1392 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1392 was detected is described hereinabove with reference to Figs. 1-8.

[48793] VGAM1392 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Wheat Streak Mosaic Virus. VGAM1392 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48794] VGAM1392 gene encodes a VGAM1392 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1392 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1392 precursor RNA is designated SEQ ID:1378, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1378 is located at position 9058 relative to the genome of Wheat Streak Mosaic Virus.

[48795] VGAM1392 precursor RNA folds onto itself, forming VGAM1392 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[48796] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1392 folded precursor RNA into VGAM1392 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM1392 RNA is designated SEQ ID:4103, and is provided hereinbelow with reference to the sequence listing part.

[48797] VGAM1392 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1392 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1392 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[48798] VGAM1392 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1392 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1392 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1392 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1392 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[48799] The complementary binding of VGAM1392 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1392 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1392 host target RNA into VGAM1392 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48800] It is appreciated that VGAM1392 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1392 host target genes. The mRNA of each one of this plurality of VGAM1392 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1392 RNA, herein designated VGAM RNA, and which when bound by VGAM1392 RNA causes inhibition of translation of respective one or more VGAM1392 host target proteins.

[48801] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1392 gene, herein designated VGAM GENE, on one or more VGAM1392 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[48802] It is yet further appreciated that a function of VGAM1392 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1392 include diagnosis, prevention and treatment of viral infection by Wheat Streak Mosaic Virus. Specific functions, and accordingly utilities, of VGAM1392 correlate with, and may be deduced from, the identity of the host target genes which VGAM1392 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48803] Nucleotide sequences of the VGAM1392 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1392 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1392 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1392 are further described hereinbelow with reference to Table 1.

[48804] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1392 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1392 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48805] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1392 gene, herein designated VGAM is inhibition of expression of VGAM1392 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1392 correlate with, and may be deduced from, the identity of the target genes which VGAM1392 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[48806] A Kinase (PRKA) Anchor Protein 1 (AKAP1, Accession NM_139275) is a VGAM1392 host target gene. AKAP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AKAP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of AKAP1 BINDING SITE, designated SEQ ID:29266, to the nucleotide sequence of VGAM1392 RNA, herein designated VGAM RNA, also designated SEQ ID:4103.

[48807] A function of VGAM1392 is therefore inhibition of A Kinase (PRKA) Anchor Protein 1 (AKAP1, Accession NM_139275), a gene which binds to type i and ii regulatory subunits of protein kinase a . Accordingly, utilities of VGAM1392 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKAP1. The function of AKAP1 has been established by previous studies. In eukaryotic cells, cytosolic cAMP activates several isoforms of cAMP-dependent protein kinases (PKAs) involved in signal transduction. PKAs are composed of 2 regulatory and 2 catalytic subunits (see OMIM Ref. No. 176911). There are 2 classes of regulatory subunits: type I, which is found primarily in cytoplasmic PKAs, and type II, a significant proportion of which is found in PKAs associated with the particulate fraction of cell homogenates. The effects of individual PKA isoforms are determined by their cellular localization, specified through binding to distinct AKAPs, named for 'A-kinase anchor protein.' Anchoring proteins target the kinase by tethering a regula-

tory subunit. Trendelenburg et al. (1996) cloned AKAP149 using an antiserum to screen a human colon cDNA expression library. The cDNA sequence of AKAP149 predicted a polypeptide of 903 amino acids with a predicted mass of 97 kD. The authors noted that a portion of the cDNA sequence of AKAP149 is identical to S-AKAP84, previously described by Lin et al. (1995). The first 517 amino acids of the sequence of AKAP149 is identical to those of the S-AKAP84 sequence (except at amino acid positions 97 and 98), including a signal sequence.

AKAP149 also has a protein/serine/threonine-rich region at amino acids 489–540, and a K-homologous (KH) motif at amino acids 612–659. Trendelenburg et al. (1996) suggested that AKAP149 and S-AKAP84 are splice variants of the same gene. The KH motif is an RNA-binding domain typically associated with proteins involved in RNA catalysis, mRNA processing, or translation. By Southern blotting, Trendelenburg et al. (1996) showed that AKAP149 is a single-copy gene in the human genome. By Northern blot analysis, they showed that AKAP149 was expressed as a 4.2-kb transcript in all epithelial tissues examined, with the strongest signal being detected in prostate and small intestine RNAs. In addition, a 3.2-kb transcript was

expressed exclusively in testis. Lin et al. (1995) found a similar pattern of expression for S-AKAP84, but also detected a minor 7.5-kb transcript in kidney, pancreas, liver, lung, and brain. By Western blotting, Trendelenburg et al. (1996) detected expression of the AKAP149 protein in colon carcinoma LS174T cells. Trendelenburg et al. (1996) speculated that AKAP149 is involved in the cAMP-dependent signal transduction pathway and in directing RNA to a specific cellular compartment. Huang et al. (1997) cloned cDNAs encoding a possible mouse homolog of S-AKAP84. Since the protein bound both PKA type I and type II regulatory subunits, they designated the gene D-Akap1 for 'dual specificity Akap1.' Previously identified AKAPs had interacted specifically with type II subunits. Northern blot analysis detected D-Akap1 expression in all tissues examined except the spleen. Huang et al. (1997) isolated cDNAs representing at least 4 splice variants. By Western blot analysis, they showed that the different protein isoforms may be expressed in a tissue-specific manner. The mitochondria target/signal region found in both S-Akap84 and D-Akap1 suggested to Huang et al. (1997) that some of the protein isoforms may be targeted to the mitochondria.

[48808] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[48809] Trendelenburg, G.; Hummel, M.; Riecken, E.-O.; Hanski, C. : Molecular characterization of AKAP149, a novel A kinase anchor protein with a KH domain. *Biochem. Biophys. Res. Commun.* 225: 313–319, 1996. ; and

[48810] Huang, L. J.; Durick, K.; Weiner, J. A.; Chun, J.; Taylor, S. S. : Identification of a novel protein kinase A anchoring protein that binds both type I and type II regulatory subunits. *J.*

[48811] Further studies establishing the function and utilities of AKAP1 are found in John Hopkins OMIM database record ID 602449, and in cited publications numbered 6316–6318 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Hepatic Leukemia Factor (HLF, Accession NM_002126) is another VGAM1392 host target gene. HLF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HLF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HLF BINDING SITE, design-

nated SEQ ID:7904, to the nucleotide sequence of VGAM1392 RNA, herein designated VGAM RNA, also designated SEQ ID:4103.

[48812] Another function of VGAM1392 is therefore inhibition of Hepatic Leukemia Factor (HLF, Accession NM_002126). Accordingly, utilities of VGAM1392 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HLF. Neogenin Homolog 1 (chicken) (NEO1, Accession NM_002499) is another VGAM1392 host target gene. NEO1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NEO1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NEO1 BINDING SITE, designated SEQ ID:8317, to the nucleotide sequence of VGAM1392 RNA, herein designated VGAM RNA, also designated SEQ ID:4103.

[48813] Another function of VGAM1392 is therefore inhibition of Neogenin Homolog 1 (chicken) (NEO1, Accession NM_002499), a gene which regulates the transition of undifferentiated proliferating cells to their differentiated state. Accordingly, utilities of VGAM1392 include diagno-

sis, prevention and treatment of diseases and clinical conditions associated with NEO1. The function of NEO1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM329. Phosphomannomutase 2 (PMM2, Accession XM_050755) is another VGAM1392 host target gene.

PMM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PMM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PMM2 BINDING SITE, designated SEQ ID:35680, to the nucleotide sequence of VGAM1392 RNA, herein designated VGAM RNA, also designated SEQ ID:4103.

[48814] Another function of VGAM1392 is therefore inhibition of Phosphomannomutase 2 (PMM2, Accession XM_050755). Accordingly, utilities of VGAM1392 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PMM2. Titin (TTN, Accession NM_133378) is another VGAM1392 host target gene. TTN BINDING SITE1 through TTN BINDING SITE3 are HOST

TARGET binding sites found in untranslated regions of mRNA encoded by TTN, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TTN BINDING SITE1 through TTN BINDING SITE3, designated SEQ ID:28502, SEQ ID:28507 and SEQ ID:28517 respectively, to the nucleotide sequence of VGAM1392 RNA, herein designated VGAM RNA, also designated SEQ ID:4103.

[48815] Another function of VGAM1392 is therefore inhibition of Titin (TTN, Accession NM_133378). Accordingly, utilities of VGAM1392 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TTN. CDC14 Cell Division Cycle 14 Homolog B (*S. cerevisiae*) (CDC14B, Accession NM_003671) is another VGAM1392 host target gene. CDC14B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CDC14B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDC14B BINDING SITE, designated SEQ ID:9761, to the nucleotide sequence of VGAM1392 RNA, herein designated VGAM

RNA, also designated SEQ ID:4103.

[48816] Another function of VGAM1392 is therefore inhibition of CDC14 Cell Division Cycle 14 Homolog B (*S. cerevisiae*) (CDC14B, Accession NM_003671). Accordingly, utilities of VGAM1392 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDC14B. FLJ13441 (Accession NM_023924) is another VGAM1392 host target gene. FLJ13441 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13441, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13441 BINDING SITE, designated SEQ ID:23392, to the nucleotide sequence of VGAM1392 RNA, herein designated VGAM RNA, also designated SEQ ID:4103.

[48817] Another function of VGAM1392 is therefore inhibition of FLJ13441 (Accession NM_023924). Accordingly, utilities of VGAM1392 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13441. FLJ22529 (Accession NM_024789) is another VGAM1392 host target gene. FLJ22529 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by FLJ22529, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22529 BINDING SITE, designated SEQ ID:24171, to the nucleotide sequence of VGAM1392 RNA, herein designated VGAM RNA, also designated SEQ ID:4103.

[48818] Another function of VGAM1392 is therefore inhibition of FLJ22529 (Accession NM_024789). Accordingly, utilities of VGAM1392 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22529. KIAA0738 (Accession NM_014719) is another VGAM1392 host target gene. KIAA0738 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0738, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0738 BINDING SITE, designated SEQ ID:16279, to the nucleotide sequence of VGAM1392 RNA, herein designated VGAM RNA, also designated SEQ ID:4103.

[48819] Another function of VGAM1392 is therefore inhibition of KIAA0738 (Accession NM_014719). Accordingly, utilities

of VGAM1392 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0738. KIAA1764 (Accession XM_045086) is another VGAM1392 host target gene. KIAA1764 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1764, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1764 BINDING SITE, designated SEQ ID:34354, to the nucleotide sequence of VGAM1392 RNA, herein designated VGAM RNA, also designated SEQ ID:4103.

[48820] Another function of VGAM1392 is therefore inhibition of KIAA1764 (Accession XM_045086). Accordingly, utilities of VGAM1392 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1764. LAGY (Accession NM_139211) is another VGAM1392 host target gene. LAGY BINDING SITE1 through LAGY BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LAGY, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of LAGY BINDING SITE1 through LAGY BINDING SITE3, designated SEQ ID:29231, SEQ ID:29233 and SEQ ID:26245 respectively, to the nucleotide sequence of VGAM1392 RNA, herein designated VGAM RNA, also designated SEQ ID:4103.

[48821] Another function of VGAM1392 is therefore inhibition of LAGY (Accession NM_139211). Accordingly, utilities of VGAM1392 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LAGY. Mitochondrial Ribosomal Protein S11 (MRPS11, Accession XM_170552) is another VGAM1392 host target gene. MRPS11 BINDING SITE1 and MRPS11 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MRPS11, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MRPS11 BINDING SITE1 and MRPS11 BINDING SITE2, designated SEQ ID:45377 and SEQ ID:12493 respectively, to the nucleotide sequence of VGAM1392 RNA, herein designated VGAM RNA, also designated SEQ ID:4103.

[48822] Another function of VGAM1392 is therefore inhibition of Mitochondrial Ribosomal Protein S11 (MRPS11, Accession

XM_170552). Accordingly, utilities of VGAM1392 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPS11. LOC150622 (Accession XM_086960) is another VGAM1392 host target gene. LOC150622 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC150622, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150622 BINDING SITE, designated SEQ ID:38996, to the nucleotide sequence of VGAM1392 RNA, herein designated VGAM RNA, also designated SEQ ID:4103.

[48823] Another function of VGAM1392 is therefore inhibition of LOC150622 (Accession XM_086960). Accordingly, utilities of VGAM1392 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150622. LOC196540 (Accession XM_116933) is another VGAM1392 host target gene. LOC196540 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC196540, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC196540 BINDING SITE, designated SEQ ID:43150, to the nucleotide sequence of VGAM1392 RNA, herein designated VGAM RNA, also designated SEQ ID:4103.

[48824] Another function of VGAM1392 is therefore inhibition of LOC196540 (Accession XM_116933). Accordingly, utilities of VGAM1392 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196540. LOC200047 (Accession XM_114099) is another VGAM1392 host target gene. LOC200047 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC200047, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200047 BINDING SITE, designated SEQ ID:42698, to the nucleotide sequence of VGAM1392 RNA, herein designated VGAM RNA, also designated SEQ ID:4103.

[48825] Another function of VGAM1392 is therefore inhibition of LOC200047 (Accession XM_114099). Accordingly, utilities of VGAM1392 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200047. LOC92597 (Accession XM_046066) is an-

other VGAM1392 host target gene. LOC92597 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92597, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92597 BINDING SITE, designated SEQ ID:34671, to the nucleotide sequence of VGAM1392 RNA, herein designated VGAM RNA, also designated SEQ ID:4103.

[48826] Another function of VGAM1392 is therefore inhibition of LOC92597 (Accession XM_046066). Accordingly, utilities of VGAM1392 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92597. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1393 (VGAM1393) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48827] VGAM1393 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1393 was detected is de-

scribed hereinabove with reference to Figs. 1–8.

[48828] VGAM1393 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Wheat Streak Mosaic Virus. VGAM1393 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48829] VGAM1393 gene encodes a VGAM1393 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1393 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1393 precursor RNA is designated SEQ ID:1379, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1379 is located at position 3923 relative to the genome of Wheat Streak Mosaic Virus.

[48830] VGAM1393 precursor RNA folds onto itself, forming VGAM1393 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA

gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48831] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1393 folded precursor RNA into VGAM1393 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1393 RNA is designated SEQ ID:4104, and is provided hereinbelow with reference to the sequence listing part.

[48832] VGAM1393 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1393 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1393 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[48833] VGAM1393 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1393 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1393 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1393 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1393 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[48834] The complementary binding of VGAM1393 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1393 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1393 host target RNA into VGAM1393 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48835] It is appreciated that VGAM1393 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1393 host target genes. The mRNA of each one of this plurality of VGAM1393 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1393 RNA, herein designated VGAM RNA, and which when bound by VGAM1393 RNA causes inhibition of translation of respective one or more VGAM1393 host target proteins.

[48836] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1393 gene, herein designated VGAM GENE, on one or more VGAM1393 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[48837] It is yet further appreciated that a function of VGAM1393 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1393 include diagnosis, prevention and treatment of viral infection by Wheat Streak Mosaic Virus. Specific functions, and accordingly utilities, of VGAM1393 correlate with, and may be deduced from, the identity of the host target genes which VGAM1393 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48838] Nucleotide sequences of the VGAM1393 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1393 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM1393 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1393 are further described hereinbelow with reference to Table 1.

[48839] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1393 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1393 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48840] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1393 gene, herein designated VGAM is inhibition of expression of VGAM1393 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1393 correlate with, and may be deduced from, the identity of the target genes which VGAM1393 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[48841] Chloride Channel, Calcium Activated, Family Member 3 (CLCA3, Accession NM_004921) is a VGAM1393 host target gene. CLCA3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLCA3, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLCA3 BINDING SITE, designated SEQ ID:11354, to the nucleotide sequence of VGAM1393 RNA, herein designated VGAM RNA, also designated SEQ ID:4104.

[48842] A function of VGAM1393 is therefore inhibition of Chloride Channel, Calcium Activated, Family Member 3 (CLCA3, Accession NM_004921), a gene which is similar to calcium-activated chloride channel family. Accordingly, utilities of VGAM1393 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLCA3. The function of CLCA3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM595. Epilepsy, Progressive Myoclonus Type 2, Lafora Disease (laforin) (EPM2A, Accession NM_005670) is another VGAM1393 host target gene. EPM2A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EPM2A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of EPM2A BINDING SITE, designated SEQ ID:12224, to the nucleotide sequence of VGAM1393 RNA, herein designated VGAM RNA, also designated SEQ ID:4104.

[48843] Another function of VGAM1393 is therefore inhibition of Epilepsy, Progressive Myoclonus Type 2, Lafora Disease (laforin) (EPM2A, Accession NM_005670), a gene which Laforin; protein tyrosine phosphatase that may have role in glycogen metabolism. Accordingly, utilities of VGAM1393 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPM2A. The function of EPM2A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM470. Melanoma Antigen, Family A, 10 (MAGEA10, Accession NM_021048) is another VGAM1393 host target gene. MAGEA10 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MAGEA10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAGEA10 BINDING SITE, designated SEQ ID:22034, to the nucleotide sequence of VGAM1393

RNA, herein designated VGAM RNA, also designated SEQ ID:4104.

[48844] Another function of VGAM1393 is therefore inhibition of Melanoma Antigen, Family A, 10 (MAGEA10, Accession NM_021048), a gene which may play a role in embryonal development and tumor transformation or aspects of tumor progression. Accordingly, utilities of VGAM1393 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAGEA10. The function of MAGEA10 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM125. Methyl-CpG Binding Domain Protein 3 (MBD3, Accession NM_003926) is another VGAM1393 host target gene. MBD3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MBD3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MBD3 BINDING SITE, designated SEQ ID:10020, to the nucleotide sequence of VGAM1393 RNA, herein designated VGAM RNA, also designated SEQ ID:4104.

[48845] Another function of VGAM1393 is therefore inhibition of

Methyl-CpG Binding Domain Protein 3 (MBD3, Accession NM_003926), a gene which are subunits of the NURD (nucleosome remodeling and histone deacetylase) complex . Accordingly, utilities of VGAM1393 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MBD3. The function of MBD3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM247. Protocadherin 11 X-linked (PCDH11X, Accession NM_032969) is another VGAM1393 host target gene. PCDH11X BINDING SITE1 and PCDH11X BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PCDH11X, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDH11X BINDING SITE1 and PCDH11X BINDING SITE2, designated SEQ ID:26799 and SEQ ID:26784 respectively, to the nucleotide sequence of VGAM1393 RNA, herein designated VGAM RNA, also designated SEQ ID:4104.

[48846] Another function of VGAM1393 is therefore inhibition of Protocadherin 11 X-linked (PCDH11X, Accession

NM_032969), a gene which is thought to play a fundamental role in cell-cell recognition essential for the segmental development and function of the central nervous system. Accordingly, utilities of VGAM1393 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH11X. The function of PCDH11X and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM433.SMG1 (Accession NM_015092) is another VGAM1393 host target gene. SMG1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SMG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMG1 BINDING SITE, designated SEQ ID:17477, to the nucleotide sequence of VGAM1393 RNA, herein designated VGAM RNA, also designated SEQ ID:4104.

[48847] Another function of VGAM1393 is therefore inhibition of SMG1 (Accession NM_015092), a gene which acts as the target for the cell-cycle arrest and immunosuppressive effects. Accordingly, utilities of VGAM1393 include diagno-

sis, prevention and treatment of diseases and clinical conditions associated with SMG1. The function of SMG1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM419.AD-020 (Accession NM_020141) is another VGAM1393 host target gene. AD-020 BINDING SITE1 and AD-020 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by AD-020, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AD-020 BINDING SITE1 and AD-020 BINDING SITE2, designated SEQ ID:21337 and SEQ ID:29867 respectively, to the nucleotide sequence of VGAM1393 RNA, herein designated VGAM RNA, also designated SEQ ID:4104.

[48848] Another function of VGAM1393 is therefore inhibition of AD-020 (Accession NM_020141). Accordingly, utilities of VGAM1393 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AD-020. FLJ00024 (Accession XM_033361) is another VGAM1393 host target gene. FLJ00024 BINDING SITE is HOST TARGET binding site found in the 5` untranslated

region of mRNA encoded by FLJ00024, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ00024 BINDING SITE, designated SEQ ID:31893, to the nucleotide sequence of VGAM1393 RNA, herein designated VGAM RNA, also designated SEQ ID:4104.

[48849] Another function of VGAM1393 is therefore inhibition of FLJ00024 (Accession XM_033361). Accordingly, utilities of VGAM1393 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00024. LOC203297 (Accession XM_059986) is another VGAM1393 host target gene. LOC203297 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC203297, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203297 BINDING SITE, designated SEQ ID:37137, to the nucleotide sequence of VGAM1393 RNA, herein designated VGAM RNA, also designated SEQ ID:4104.

[48850] Another function of VGAM1393 is therefore inhibition of LOC203297 (Accession XM_059986). Accordingly, utilities

of VGAM1393 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203297. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1394 (VGAM1394) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48851] VGAM1394 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1394 was detected is described hereinabove with reference to Figs. 1–8.

[48852] VGAM1394 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Wheat Streak Mosaic Virus. VGAM1394 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48853] VGAM1394 gene encodes a VGAM1394 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1394 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu–

cleotide sequence of VGAM1394 precursor RNA is designated SEQ ID:1380, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1380 is located at position 2215 relative to the genome of Wheat Streak Mosaic Virus.

- [48854] VGAM1394 precursor RNA folds onto itself, forming VGAM1394 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [48855] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1394 folded precursor RNA into VGAM1394 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1394 RNA is designated SEQ ID:4105, and

is provided hereinbelow with reference to the sequence listing part.

[48856] VGAM1394 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1394 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1394 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[48857] VGAM1394 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1394 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1394 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM1394 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1394 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[48858] The complementary binding of VGAM1394 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1394 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1394 host target RNA into VGAM1394 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48859] It is appreciated that VGAM1394 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1394 host target genes. The mRNA of each one of this plurality of VGAM1394 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com–

plementary to VGAM1394 RNA, herein designated VGAM RNA, and which when bound by VGAM1394 RNA causes inhibition of translation of respective one or more VGAM1394 host target proteins.

[48860] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1394 gene, herein designated VGAM GENE, on one or more VGAM1394 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[48861] It is yet further appreciated that a function of VGAM1394 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1394 include diagnosis, prevention and treatment of viral infection by Wheat Streak Mosaic Virus. Specific functions, and accordingly utilities, of VGAM1394 correlate with, and may be deduced from, the identity of the host target genes which VGAM1394 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48862] Nucleotide sequences of the VGAM1394 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1394 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1394 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1394 are further described hereinbelow with reference to Table 1.

[48863] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1394 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1394 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48864] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM1394 gene, herein designated VGAM is inhibition of expression of VGAM1394 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1394 correlate with, and may be deduced from, the identity of the target genes which VGAM1394 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[48865] Phosphoinositide-3-kinase, Regulatory Subunit, Polypeptide 3 (p55, gamma) (PIK3R3, Accession XM_027982) is a VGAM1394 host target gene. PIK3R3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PIK3R3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIK3R3 BINDING SITE, designated SEQ ID:30602, to the nucleotide sequence of VGAM1394 RNA, herein designated VGAM RNA, also designated SEQ ID:4105.

[48866] A function of VGAM1394 is therefore inhibition of Phosphoinositide-3-kinase, Regulatory Subunit, Polypeptide 3 (p55, gamma) (PIK3R3, Accession XM_027982). Accordingly, utilities of VGAM1394 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with PIK3R3. Sarcoglycan, Beta (43kDa dystrophin-associated glycoprotein) (SGCB, Accession NM_000232) is another VGAM1394 host target gene. SGCB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SGCB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SGCB BINDING SITE, designated SEQ ID:5743, to the nucleotide sequence of VGAM1394 RNA, herein designated VGAM RNA, also designated SEQ ID:4105.

[48867] Another function of VGAM1394 is therefore inhibition of Sarcoglycan, Beta (43kDa dystrophin-associated glycoprotein) (SGCB, Accession NM_000232). Accordingly, utilities of VGAM1394 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SGCB. Doublecortin and CaM Kinase-like 1 (DCAMKL1, Accession NM_004734) is another VGAM1394 host target gene. DCAMKL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DCAMKL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of DCAMKL1 BINDING SITE, designated SEQ ID:11112, to the nucleotide sequence of VGAM1394 RNA, herein designated VGAM RNA, also designated SEQ ID:4105.

[48868] Another function of VGAM1394 is therefore inhibition of Doublecortin and CaM Kinase-like 1 (DCAMKL1, Accession NM_004734). Accordingly, utilities of VGAM1394 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DCAMKL1. FLJ12517 (Accession NM_023007) is another VGAM1394 host target gene. FLJ12517 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12517, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12517 BINDING SITE, designated SEQ ID:23269, to the nucleotide sequence of VGAM1394 RNA, herein designated VGAM RNA, also designated SEQ ID:4105.

[48869] Another function of VGAM1394 is therefore inhibition of FLJ12517 (Accession NM_023007). Accordingly, utilities of VGAM1394 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ12517. FLJ14936 (Accession NM_032864) is another VGAM1394 host target gene. FLJ14936 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14936, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14936 BINDING SITE, designated SEQ ID:26669, to the nucleotide sequence of VGAM1394 RNA, herein designated VGAM RNA, also designated SEQ ID:4105.

[48870] Another function of VGAM1394 is therefore inhibition of FLJ14936 (Accession NM_032864). Accordingly, utilities of VGAM1394 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14936. HH114 (Accession NM_032499) is another VGAM1394 host target gene. HH114 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HH114, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HH114 BINDING SITE, designated SEQ ID:26249, to the nucleotide sequence of VGAM1394 RNA, herein designated VGAM RNA,

also designated SEQ ID:4105.

[48871] Another function of VGAM1394 is therefore inhibition of HH114 (Accession NM_032499). Accordingly, utilities of VGAM1394 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HH114. TTY7 (Accession NM_031926) is another VGAM1394 host target gene. TTY7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TTY7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TTY7 BINDING SITE, designated SEQ ID:25672, to the nucleotide sequence of VGAM1394 RNA, herein designated VGAM RNA, also designated SEQ ID:4105.

[48872] Another function of VGAM1394 is therefore inhibition of TTY7 (Accession NM_031926). Accordingly, utilities of VGAM1394 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TTY7. LOC147054 (Accession XM_097172) is another VGAM1394 host target gene. LOC147054 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147054, corresponding

to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147054 BINDING SITE, designated SEQ ID:40793, to the nucleotide sequence of VGAM1394 RNA, herein designated VGAM RNA, also designated SEQ ID:4105.

[48873] Another function of VGAM1394 is therefore inhibition of LOC147054 (Accession XM_097172). Accordingly, utilities of VGAM1394 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147054. LOC147929 (Accession XM_085961) is another VGAM1394 host target gene. LOC147929 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147929, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147929 BINDING SITE, designated SEQ ID:38420, to the nucleotide sequence of VGAM1394 RNA, herein designated VGAM RNA, also designated SEQ ID:4105.

[48874] Another function of VGAM1394 is therefore inhibition of LOC147929 (Accession XM_085961). Accordingly, utilities of VGAM1394 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC147929. LOC90591 (Accession XM_032811) is another VGAM1394 host target gene. LOC90591 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90591, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90591 BINDING SITE, designated SEQ ID:31759, to the nucleotide sequence of VGAM1394 RNA, herein designated VGAM RNA, also designated SEQ ID:4105.

[48875] Another function of VGAM1394 is therefore inhibition of LOC90591 (Accession XM_032811). Accordingly, utilities of VGAM1394 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90591. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1395 (VGAM1395) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48876] VGAM1395 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1395 was detected is described hereinabove with reference to Figs. 1–8.

[48877] VGAM1395 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpea Aphid-borne Mosaic Virus. VGAM1395 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48878] VGAM1395 gene encodes a VGAM1395 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1395 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1395 precursor RNA is designated SEQ ID:1381, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1381 is located at position 3170 relative to the genome of Cowpea Aphid-borne Mosaic Virus.

[48879] VGAM1395 precursor RNA folds onto itself, forming VGAM1395 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48880] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1395 folded precursor RNA into VGAM1395 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1395 RNA is designated SEQ ID:4106, and is provided hereinbelow with reference to the sequence listing part.

[48881] VGAM1395 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1395 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1395 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[48882] VGAM1395 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1395 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1395 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1395 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1395 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[48883] The complementary binding of VGAM1395 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1395 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1395 host target RNA into VGAM1395 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48884] It is appreciated that VGAM1395 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1395 host target genes. The mRNA of each one of this plurality of VGAM1395 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1395 RNA, herein designated VGAM RNA, and which when bound by VGAM1395 RNA causes inhibition of translation of respective one or more VGAM1395 host target proteins.

[48885] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1395 gene, herein designated VGAM GENE, on one or more VGAM1395 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[48886] It is yet further appreciated that a function of VGAM1395 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1395 include diagnosis, prevention and treatment of viral infection by Cowpea Aphid-borne Mosaic Virus. Specific functions, and accordingly utilities, of VGAM1395 correlate with, and may be deduced from, the identity of the host target genes which VGAM1395 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48887] Nucleotide sequences of the VGAM1395 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM1395 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1395 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1395 are further described hereinbelow with reference to Table 1.

[48888] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1395 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1395 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48889] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1395 gene, herein designated VGAM is inhibition of expression of VGAM1395 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1395 correlate with, and may be deduced from, the identity of the target genes which VGAM1395 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[48890] Chorea Acanthocytosis (CHAC, Accession NM_033305) is a VGAM1395 host target gene. CHAC BINDING SITE is HOST TARGET binding site found in the 3` untranslated region

of mRNA encoded by CHAC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHAC BINDING SITE, designated SEQ ID:27141, to the nucleotide sequence of VGAM1395 RNA, herein designated VGAM RNA, also designated SEQ ID:4106.

[48891] A function of VGAM1395 is therefore inhibition of Chorea Acanthocytosis (CHAC, Accession NM_033305), a gene which may regulate the cycling of proteins. Accordingly, utilities of VGAM1395 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHAC. The function of CHAC and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM650.Epha3 (EPHA3, Accession NM_005233) is another VGAM1395 host target gene. EPHA3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EPHA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPHA3 BINDING SITE, designated SEQ

ID:11739, to the nucleotide sequence of VGAM1395 RNA, herein designated VGAM RNA, also designated SEQ ID:4106.

[48892] Another function of VGAM1395 is therefore inhibition of EphA3 (EPHA3, Accession NM_005233), a gene which binds to ephrin-a2, -a3, -a4 and -a5. could play a role in lymphoid function. Accordingly, utilities of VGAM1395 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPHA3. The function of EPHA3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM164. EphB2 (EPHB2, Accession NM_004442) is another VGAM1395 host target gene. EPHB2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EPHB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPHB2 BINDING SITE, designated SEQ ID:10729, to the nucleotide sequence of VGAM1395 RNA, herein designated VGAM RNA, also designated SEQ ID:4106.

[48893] Another function of VGAM1395 is therefore inhibition of

EphB2 (EPHB2, Accession NM_004442), a gene which Eph-related receptor tyrosine kinase B2; may have a role in neurogenesis. Accordingly, utilities of VGAM1395 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPHB2. The function of EPHB2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM533. RAR-related Orphan Receptor B (RORB, Accession NM_006914) is another VGAM1395 host target gene. RORB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RORB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RORB BINDING SITE, designated SEQ ID:13788, to the nucleotide sequence of VGAM1395 RNA, herein designated VGAM RNA, also designated SEQ ID:4106.

[48894] Another function of VGAM1395 is therefore inhibition of RAR-related Orphan Receptor B (RORB, Accession NM_006914), a gene which is an orphan nuclear receptor. Accordingly, utilities of VGAM1395 include diagnosis, prevention and treatment of diseases and clinical condi-

tions associated with RORB. The function of RORB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM178. Carbohydrate (chondroitin 6) Sulfotransferase 3 (CHST3, Accession NM_004273) is another VGAM1395 host target gene. CHST3 BINDING SITE1 and CHST3 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CHST3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHST3 BINDING SITE1 and CHST3 BINDING SITE2, designated SEQ ID:10473 and SEQ ID:10481 respectively, to the nucleotide sequence of VGAM1395 RNA, herein designated VGAM RNA, also designated SEQ ID:4106.

[48895] Another function of VGAM1395 is therefore inhibition of Carbohydrate (chondroitin 6) Sulfotransferase 3 (CHST3, Accession NM_004273). Accordingly, utilities of VGAM1395 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHST3. FLJ23042 (Accession NM_025157) is another VGAM1395 host target gene. FLJ23042 BINDING SITE is HOST TARGET

binding site found in the 3` untranslated region of mRNA encoded by FLJ23042, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23042 BINDING SITE, designated SEQ ID:24798, to the nucleotide sequence of VGAM1395 RNA, herein designated VGAM RNA, also designated SEQ ID:4106.

[48896] Another function of VGAM1395 is therefore inhibition of FLJ23042 (Accession NM_025157). Accordingly, utilities of VGAM1395 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23042. KIAA0232 (Accession XM_052627) is another VGAM1395 host target gene. KIAA0232 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0232, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0232 BINDING SITE, designated SEQ ID:36036, to the nucleotide sequence of VGAM1395 RNA, herein designated VGAM RNA, also designated SEQ ID:4106.

[48897] Another function of VGAM1395 is therefore inhibition of

KIAA0232 (Accession XM_052627). Accordingly, utilities of VGAM1395 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0232. KIAA0478 (Accession NM_014870) is another VGAM1395 host target gene. KIAA0478 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0478, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0478 BINDING SITE, designated SEQ ID:16973, to the nucleotide sequence of VGAM1395 RNA, herein designated VGAM RNA, also designated SEQ ID:4106.

[48898] Another function of VGAM1395 is therefore inhibition of KIAA0478 (Accession NM_014870). Accordingly, utilities of VGAM1395 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0478. KIAA1319 (Accession NM_020770) is another VGAM1395 host target gene. KIAA1319 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1319, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1319 BINDING SITE, designated SEQ ID:21865, to the nucleotide sequence of VGAM1395 RNA, herein designated VGAM RNA, also designated SEQ ID:4106.

[48899] Another function of VGAM1395 is therefore inhibition of KIAA1319 (Accession NM_020770). Accordingly, utilities of VGAM1395 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1319. LOC139673 (Accession XM_071645) is another VGAM1395 host target gene. LOC139673 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC139673, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC139673 BINDING SITE, designated SEQ ID:37406, to the nucleotide sequence of VGAM1395 RNA, herein designated VGAM RNA, also designated SEQ ID:4106.

[48900] Another function of VGAM1395 is therefore inhibition of LOC139673 (Accession XM_071645). Accordingly, utilities of VGAM1395 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC139673. LOC145317 (Accession XM_096760) is an-

other VGAM1395 host target gene. LOC145317 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145317, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145317 BINDING SITE, designated SEQ ID:40529, to the nucleotide sequence of VGAM1395 RNA, herein designated VGAM RNA, also designated SEQ ID:4106.

[48901] Another function of VGAM1395 is therefore inhibition of LOC145317 (Accession XM_096760). Accordingly, utilities of VGAM1395 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145317. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1396 (VGAM1396) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48902] VGAM1396 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1396 was detected is de-

scribed hereinabove with reference to Figs. 1–8.

[48903] VGAM1396 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpea Aphid–borne Mosaic Virus. VGAM1396 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48904] VGAM1396 gene encodes a VGAM1396 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1396 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1396 precursor RNA is designated SEQ ID:1382, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1382 is located at position 3478 relative to the genome of Cowpea Aphid–borne Mosaic Virus.

[48905] VGAM1396 precursor RNA folds onto itself, forming VGAM1396 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two–dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA

gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48906] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1396 folded precursor RNA into VGAM1396 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1396 RNA is designated SEQ ID:4107, and is provided hereinbelow with reference to the sequence listing part.

[48907] VGAM1396 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1396 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1396 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[48908] VGAM1396 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1396 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1396 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1396 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1396 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[48909] The complementary binding of VGAM1396 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1396 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1396 host target RNA into VGAM1396 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48910] It is appreciated that VGAM1396 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1396 host target genes. The mRNA of each one of this plurality of VGAM1396 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1396 RNA, herein designated VGAM RNA, and which when bound by VGAM1396 RNA causes inhibition of translation of respective one or more VGAM1396 host target proteins.

[48911] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1396 gene, herein designated VGAM GENE, on one or more VGAM1396 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[48912] It is yet further appreciated that a function of VGAM1396 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1396 include diagnosis, prevention and treatment of viral infection by Cowpea Aphid-borne Mosaic Virus. Specific functions, and accordingly utilities, of VGAM1396 correlate with, and may be deduced from, the identity of the host target genes which VGAM1396 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48913] Nucleotide sequences of the VGAM1396 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1396 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM1396 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1396 are further described hereinbelow with reference to Table 1.

[48914] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1396 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1396 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48915] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1396 gene, herein designated VGAM is inhibition of expression of VGAM1396 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1396 correlate with, and may be deduced from, the identity of the target genes which VGAM1396 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[48916] FKRP (Accession NM_024301) is a VGAM1396 host target gene. FKRP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FKRP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Ta-

ble 2 illustrates the complementarity of the nucleotide sequences of FKRP BINDING SITE, designated SEQ ID:23592, to the nucleotide sequence of VGAM1396 RNA, herein designated VGAM RNA, also designated SEQ ID:4107.

[48917] A function of VGAM1396 is therefore inhibition of FKRP (Accession NM_024301). Accordingly, utilities of VGAM1396 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FKRP. Phosphatidylcholine Transfer Protein (PCTP, Accession NM_021213) is another VGAM1396 host target gene. PCTP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCTP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCTP BINDING SITE, designated SEQ ID:22193, to the nucleotide sequence of VGAM1396 RNA, herein designated VGAM RNA, also designated SEQ ID:4107.

[48918] Another function of VGAM1396 is therefore inhibition of Phosphatidylcholine Transfer Protein (PCTP, Accession NM_021213), a gene which catalyzes the transfer of phosphatidylcholine between membranes (by similarity). Accordingly, utilities of VGAM1396 include diagnosis, pre-

vention and treatment of diseases and clinical conditions associated with PCTP. The function of PCTP has been established by previous studies. Phosphatidylcholine (PC) transfer protein (PCTP) is a cytosolic protein first purified from bovine and rat liver that catalyzes intermembrane transfer of PC. By searching an EST database for homologs of bovine Pctp, followed by 5-prime RACE and PCR of a kidney cDNA library, Cohen et al. (1999) obtained a cDNA encoding human PCTP. The deduced 214-amino acid human protein is 76% and 80% identical to bovine and rat Pctp, respectively. Northern blot analysis revealed wide expression of an approximately 2.3-kb PCTP transcript in all tissues tested except thymus. Highest expression was detected in liver, placenta, testis, kidney, and heart, and lowest levels were found in brain and lung. Animal model experiments lend further support to the function of PCTP. Van Helvoort et al. (1999) disrupted the Pctp gene in mice. Pctp knockout mice showed no defects in the secretion of PC into bile or lung surfactant, and the lipid content and composition of bile and surfactant was normal. The authors concluded that PCTP does not play a major role in transporting PC from the endoplasmic reticulum, where it is synthesized, to the hepatocyte canalicular membrane.

[48919] It is appreciated that the abovementioned animal model for PCTP is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[48920] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[48921] Cohen, D. E.; Green, R. M.; Wu, M. K.; Beier, D. R. : Cloning, tissue-specific expression, gene structure and chromosomal localization of human phosphatidylcholine transfer protein. *Biochim. Biophys. Acta* 1447: 265–270, 1999. ; and

[48922] van Helvoort, A.; de Brouwer, A.; Ottenhoff, R.; Brouwers, J. F. H. M.; Wijnholds, J.; Beijnen, J. H.; Rijneveld, A.; van der Valk, M. A.; Majoor, D.; Voorhout, W.; Wirtz, K. W. A.; El.

[48923] Further studies establishing the function and utilities of PCTP are found in John Hopkins OMIM database record ID 606055, and in cited publications numbered 6826–6827 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Renal Tumor Antigen (RAGE, Accession NM_014226) is another VGAM1396 host target gene. RAGE BINDING SITE is HOST TARGET

binding site found in the 5' untranslated region of mRNA encoded by RAGE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAGE BINDING SITE, designated SEQ ID:15495, to the nucleotide sequence of VGAM1396 RNA, herein designated VGAM RNA, also designated SEQ ID:4107.

[48924] Another function of VGAM1396 is therefore inhibition of Renal Tumor Antigen (RAGE, Accession NM_014226), a gene which is essential for the completion of the start, the controlling event, in the cell cycle. Accordingly, utilities of VGAM1396 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAGE. The function of RAGE has been established by previous studies. Sugaya et al. (1994) identified 3 genes located 90 to 140 kb centromeric to the tenascin-like gene (OMIM Ref. No. 600261) in the MHC class III region near the junction with class II. One of these was the gene for receptor of advanced glycosylation end products of proteins, a member of the immunoglobulin superfamily. A second was the PBX2 homeo box gene (OMIM Ref. No. 176311), and a third was the human counterpart of the

mouse mammary tumor gene int-3 (OMIM Ref. No. 164951). The PBX2 and AGER genes are immediately contiguous and are transcribed in the same direction. In addition to mapping by contiguous cosmids and YAC clones, Sugaya et al. (1994) determined the location of the AGER sequence on 6p21.3 by fluorescence in situ hybridization. Yan et al. (1996) reported that the AGER protein, called RAGE (receptor for advanced glycation end products) by them, is an important receptor for the amyloid beta peptide (OMIM Ref. No. 104760) and that expression of this receptor increases in Alzheimer disease (OMIM Ref. No. 104300). They noted that expression of RAGE is particularly increased in neurons close to deposits of amyloid beta peptide and to neurofibrillary tangles.

[48925] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[48926] Sugaya, K.; Fukagawa, T.; Matsumoto, K.; Mita, K.; Takahashi, E.; Ando, A.; Inoko, H.; Ikemura, T. : Three genes in the human MHC class III region near the junction with the class II: gene for receptor of advanced glycosylation end products, PBX2 homeobox gene and a Notch homolog, human counterpart of mouse mammary tumor gene int-3.

Genomics 23: 408–419, 1994. ; and

Slattery, T.; Zhao, L.; Nagashima, M.; Morser, J.; Migheli,
A.; Nawroth, P.; Stern, D.; Schmidt, A. M. : RAGE and amy-
loid-beta.

[48928] Further studies establishing the function and utilities of RAGE are found in John Hopkins OMIM database record ID 600214, and in cited publications numbered 10683, 1080 and 10684 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Serine/threonine Kinase 31 (STK31, Accession NM_032944) is another VGAM1396 host target gene. STK31 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by STK31, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STK31 BINDING SITE, designated SEQ ID:26761, to the nucleotide sequence of VGAM1396 RNA, herein designated VGAM RNA, also designated SEQ ID:4107.

[48929] Another function of VGAM1396 is therefore inhibition of Serine/threonine Kinase 31 (STK31, Accession NM_032944). Accordingly, utilities of VGAM1396 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STK31. KIAA0293 (Accession XM_027045) is another VGAM1396 host target gene. KIAA0293 BINDING SITE is HOST TARGET binding

site found in the 5` untranslated region of mRNA encoded by KIAA0293, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0293 BINDING SITE, designated SEQ ID:30396, to the nucleotide sequence of VGAM1396 RNA, herein designated VGAM RNA, also designated SEQ ID:4107.

[48930] Another function of VGAM1396 is therefore inhibition of KIAA0293 (Accession XM_027045). Accordingly, utilities of VGAM1396 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0293. KIAA1023 (Accession NM_017604) is another VGAM1396 host target gene. KIAA1023 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1023, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1023 BINDING SITE, designated SEQ ID:19088, to the nucleotide sequence of VGAM1396 RNA, herein designated VGAM RNA, also designated SEQ ID:4107.

[48931] Another function of VGAM1396 is therefore inhibition of

KIAA1023 (Accession NM_017604). Accordingly, utilities of VGAM1396 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1023. MGC16384 (Accession NM_053048) is another VGAM1396 host target gene. MGC16384 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC16384, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC16384 BINDING SITE, designated SEQ ID:27593, to the nucleotide sequence of VGAM1396 RNA, herein designated VGAM RNA, also designated SEQ ID:4107.

[48932] Another function of VGAM1396 is therefore inhibition of MGC16384 (Accession NM_053048). Accordingly, utilities of VGAM1396 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC16384. MGC16386 (Accession NM_080668) is another VGAM1396 host target gene. MGC16386 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC16386, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of MGC16386 BINDING SITE, designated SEQ ID:27958, to the nucleotide sequence of VGAM1396 RNA, herein designated VGAM RNA, also designated SEQ ID:4107.

[48933] Another function of VGAM1396 is therefore inhibition of MGC16386 (Accession NM_080668). Accordingly, utilities of VGAM1396 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC16386. MGC4549 (Accession NM_032377) is another VGAM1396 host target gene. MGC4549 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC4549, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4549 BINDING SITE, designated SEQ ID:26171, to the nucleotide sequence of VGAM1396 RNA, herein designated VGAM RNA, also designated SEQ ID:4107.

[48934] Another function of VGAM1396 is therefore inhibition of MGC4549 (Accession NM_032377). Accordingly, utilities of VGAM1396 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4549. Synaptopodin 2 (SYNPO2, Accession

XM_050219) is another VGAM1396 host target gene.

SYNPO2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SYNPO2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYNPO2 BINDING SITE, designated SEQ ID:35593, to the nucleotide sequence of VGAM1396 RNA, herein designated VGAM RNA, also designated SEQ ID:4107.

[48935] Another function of VGAM1396 is therefore inhibition of Synaptopodin 2 (SYNPO2, Accession XM_050219). Accordingly, utilities of VGAM1396 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYNPO2. LOC146229 (Accession XM_085387) is another VGAM1396 host target gene. LOC146229 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146229, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146229 BINDING SITE, designated SEQ ID:38108, to the nucleotide sequence of VGAM1396 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4107.

[48936] Another function of VGAM1396 is therefore inhibition of LOC146229 (Accession XM_085387). Accordingly, utilities of VGAM1396 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146229. LOC151816 (Accession XM_098122) is another VGAM1396 host target gene. LOC151816 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151816, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151816 BINDING SITE, designated SEQ ID:41390, to the nucleotide sequence of VGAM1396 RNA, herein designated VGAM RNA, also designated SEQ ID:4107.

[48937] Another function of VGAM1396 is therefore inhibition of LOC151816 (Accession XM_098122). Accordingly, utilities of VGAM1396 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151816. LOC154449 (Accession XM_087928) is another VGAM1396 host target gene. LOC154449 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC154449, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154449 BINDING SITE, designated SEQ ID:39476, to the nucleotide sequence of VGAM1396 RNA, herein designated VGAM RNA, also designated SEQ ID:4107.

[48938] Another function of VGAM1396 is therefore inhibition of LOC154449 (Accession XM_087928). Accordingly, utilities of VGAM1396 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154449. LOC155179 (Accession XM_088169) is another VGAM1396 host target gene. LOC155179 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC155179, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155179 BINDING SITE, designated SEQ ID:39555, to the nucleotide sequence of VGAM1396 RNA, herein designated VGAM RNA, also designated SEQ ID:4107.

[48939] Another function of VGAM1396 is therefore inhibition of LOC155179 (Accession XM_088169). Accordingly, utilities of VGAM1396 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC155179. LOC158056 (Accession XM_088463) is another VGAM1396 host target gene. LOC158056 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC158056, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158056 BINDING SITE, designated SEQ ID:39716, to the nucleotide sequence of VGAM1396 RNA, herein designated VGAM RNA, also designated SEQ ID:4107.

[48940] Another function of VGAM1396 is therefore inhibition of LOC158056 (Accession XM_088463). Accordingly, utilities of VGAM1396 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158056. LOC158525 (Accession XM_088593) is another VGAM1396 host target gene. LOC158525 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC158525, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158525 BINDING SITE, designated SEQ ID:39859, to

the nucleotide sequence of VGAM1396 RNA, herein designated VGAM RNA, also designated SEQ ID:4107.

[48941] Another function of VGAM1396 is therefore inhibition of LOC158525 (Accession XM_088593). Accordingly, utilities of VGAM1396 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158525. LOC197196 (Accession XM_117003) is another VGAM1396 host target gene. LOC197196 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC197196, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197196 BINDING SITE, designated SEQ ID:43198, to the nucleotide sequence of VGAM1396 RNA, herein designated VGAM RNA, also designated SEQ ID:4107.

[48942] Another function of VGAM1396 is therefore inhibition of LOC197196 (Accession XM_117003). Accordingly, utilities of VGAM1396 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197196. LOC221486 (Accession XM_165760) is another VGAM1396 host target gene. LOC221486 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC221486, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221486 BINDING SITE, designated SEQ ID:43745, to the nucleotide sequence of VGAM1396 RNA, herein designated VGAM RNA, also designated SEQ ID:4107.

[48943] Another function of VGAM1396 is therefore inhibition of LOC221486 (Accession XM_165760). Accordingly, utilities of VGAM1396 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221486. LOC51200 (Accession NM_016352) is another VGAM1396 host target gene. LOC51200 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51200, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51200 BINDING SITE, designated SEQ ID:18483, to the nucleotide sequence of VGAM1396 RNA, herein designated VGAM RNA, also designated SEQ ID:4107.

[48944] Another function of VGAM1396 is therefore inhibition of LOC51200 (Accession NM_016352). Accordingly, utilities

of VGAM1396 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51200. LOC90381 (Accession XM_031334) is another VGAM1396 host target gene. LOC90381 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90381, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90381 BINDING SITE, designated SEQ ID:31343, to the nucleotide sequence of VGAM1396 RNA, herein designated VGAM RNA, also designated SEQ ID:4107.

[48945] Another function of VGAM1396 is therefore inhibition of LOC90381 (Accession XM_031334). Accordingly, utilities of VGAM1396 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90381. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1397 (VGAM1397) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48946] VGAM1397 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1397 was detected is described hereinabove with reference to Figs. 1–8.

[48947] VGAM1397 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpea Aphid–borne Mosaic Virus. VGAM1397 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48948] VGAM1397 gene encodes a VGAM1397 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1397 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1397 precursor RNA is designated SEQ ID:1383, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1383 is located at position 2518 relative to the genome of Cowpea Aphid–borne Mosaic Virus.

[48949] VGAM1397 precursor RNA folds onto itself, forming VGAM1397 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two–dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[48950] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1397 folded precursor RNA into VGAM1397 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 58%) nucleotide sequence of VGAM1397 RNA is designated SEQ ID:4108, and is provided hereinbelow with reference to the sequence listing part.

[48951] VGAM1397 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1397 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1397 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[48952] VGAM1397 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1397 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1397 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1397 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1397 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[48953] The complementary binding of VGAM1397 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1397 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1397 host target RNA into VGAM1397 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48954] It is appreciated that VGAM1397 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1397 host target genes. The mRNA of each one of this plurality of VGAM1397 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1397 RNA, herein designated VGAM RNA, and which when bound by VGAM1397 RNA causes inhibition of translation of respective one or more VGAM1397 host target proteins.

[48955] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1397 gene, herein designated VGAM GENE, on one or more VGAM1397 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[48956] It is yet further appreciated that a function of VGAM1397 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1397 include diagnosis, prevention and treatment of viral infection by Cowpea Aphid-borne Mosaic Virus. Specific functions, and accordingly utilities, of VGAM1397 correlate with, and may be deduced from, the identity of the host target genes which VGAM1397 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48957] Nucleotide sequences of the VGAM1397 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the
`diced` VGAM1397 RNA, herein designated VGAM RNA,
and a schematic representation of the secondary folding
of VGAM1397 folded precursor RNA, herein designated
VGAM FOLDED PRECURSOR RNA, of VGAM1397 are further
described hereinbelow with reference to Table 1.

[48958] Nucleotide sequences of host target binding sites, such as
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of
Fig. 1, found on VGAM1397 host target RNA, and
schematic representation of the complementarity of each
of these host target binding sites to VGAM1397 RNA,
herein designated VGAM RNA, are described hereinbelow
with reference to Table 2.

[48959] As mentioned hereinabove with reference to Fig. 1, a
function of VGAM1397 gene, herein designated VGAM is
inhibition of expression of VGAM1397 target genes. It is
appreciated that specific functions, and accordingly utili-
ties, of VGAM1397 correlate with, and may be deduced
from, the identity of the target genes which VGAM1397
binds and inhibits, and the function of these target genes,
as elaborated hereinbelow.

[48960] Diptheria Toxin Resistance Protein Required For Diph-
thamide Biosynthesis-like 2 (*S. cerevisiae*) (DPH2L2, Ac-

cession NM_001384) is a VGAM1397 host target gene. DPH2L2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DPH2L2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DPH2L2 BINDING SITE, designated SEQ ID:7057, to the nucleotide sequence of VGAM1397 RNA, herein designated VGAM RNA, also designated SEQ ID:4108.

[48961] A function of VGAM1397 is therefore inhibition of Diptheria Toxin Resistance Protein Required For Diphthamide Biosynthesis-like 2 (*S. cerevisiae*) (DPH2L2, Accession NM_001384), a gene which is required for diphthamide biosynthesis. Accordingly, utilities of VGAM1397 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DPH2L2. The function of DPH2L2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1221. Low Density Lipoprotein Receptor-related Protein 4 (LRP4, Accession XM_035037) is another VGAM1397 host target gene. LRP4 BINDING SITE is HOST

TARGET binding site found in the 3' untranslated region of mRNA encoded by LRP4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LRP4 BINDING SITE, designated SEQ ID:32199, to the nucleotide sequence of VGAM1397 RNA, herein designated VGAM RNA, also designated SEQ ID:4108.

[48962] Another function of VGAM1397 is therefore inhibition of Low Density Lipoprotein Receptor-related Protein 4 (LRP4, Accession XM_035037). Accordingly, utilities of VGAM1397 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LRP4. Presenilin 1 (Alzheimer disease 3) (PSEN1, Accession NM_000021) is another VGAM1397 host target gene. PSEN1 BINDING SITE1 and PSEN1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PSEN1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSEN1 BINDING SITE1 and PSEN1 BINDING SITE2, designated SEQ ID:5454 and SEQ ID:14232 respectively, to the nucleotide sequence of

VGAM1397 RNA, herein designated VGAM RNA, also designated SEQ ID:4108.

[48963] Another function of VGAM1397 is therefore inhibition of Presenilin 1 (Alzheimer disease 3) (PSEN1, Accession NM_000021). Accordingly, utilities of VGAM1397 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSEN1. Eukaryotic Translation Initiation Factor 5 (EIF5, Accession NM_001969) is another VGAM1397 host target gene. EIF5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EIF5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EIF5 BINDING SITE, designated SEQ ID:7697, to the nucleotide sequence of VGAM1397 RNA, herein designated VGAM RNA, also designated SEQ ID:4108.

[48964] Another function of VGAM1397 is therefore inhibition of Eukaryotic Translation Initiation Factor 5 (EIF5, Accession NM_001969). Accordingly, utilities of VGAM1397 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EIF5. KIAA0179 (Accession XM_035973) is another VGAM1397 host target gene.

KIAA0179 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0179, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0179 BINDING SITE, designated SEQ ID:32365, to the nucleotide sequence of VGAM1397 RNA, herein designated VGAM RNA, also designated SEQ ID:4108.

[48965] Another function of VGAM1397 is therefore inhibition of KIAA0179 (Accession XM_035973). Accordingly, utilities of VGAM1397 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0179. KIAA0215 (Accession NM_014735) is another VGAM1397 host target gene. KIAA0215 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0215, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0215 BINDING SITE, designated SEQ ID:16382, to the nucleotide sequence of VGAM1397 RNA, herein designated VGAM RNA, also designated SEQ ID:4108.

[48966] Another function of VGAM1397 is therefore inhibition of KIAA0215 (Accession NM_014735). Accordingly, utilities of VGAM1397 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0215. KIAA0459 (Accession XM_027862) is another VGAM1397 host target gene. KIAA0459 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0459, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0459 BINDING SITE, designated SEQ ID:30582, to the nucleotide sequence of VGAM1397 RNA, herein designated VGAM RNA, also designated SEQ ID:4108.

[48967] Another function of VGAM1397 is therefore inhibition of KIAA0459 (Accession XM_027862). Accordingly, utilities of VGAM1397 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0459. KIAA1814 (Accession XM_046822) is another VGAM1397 host target gene. KIAA1814 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1814, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1814 BINDING SITE, designated SEQ ID:34836, to the nucleotide sequence of VGAM1397 RNA, herein designated VGAM RNA, also designated SEQ ID:4108.

[48968] Another function of VGAM1397 is therefore inhibition of KIAA1814 (Accession XM_046822). Accordingly, utilities of VGAM1397 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1814. TNF Receptor-associated Factor 3 (TRAF3, Accession XM_007256) is another VGAM1397 host target gene. TRAF3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRAF3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRAF3 BINDING SITE, designated SEQ ID:30038, to the nucleotide sequence of VGAM1397 RNA, herein designated VGAM RNA, also designated SEQ ID:4108.

[48969] Another function of VGAM1397 is therefore inhibition of TNF Receptor-associated Factor 3 (TRAF3, Accession XM_007256). Accordingly, utilities of VGAM1397 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with TRAF3. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1398 (VGAM1398) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[48970] VGAM1398 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1398 was detected is described hereinabove with reference to Figs. 1–8.

[48971] VGAM1398 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Perina Nuda Picorna-like Virus. VGAM1398 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[48972] VGAM1398 gene encodes a VGAM1398 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1398 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1398 precursor RNA is desig-

nated SEQ ID:1384, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1384 is located at position 9232 relative to the genome of Perina Nuda Picorna-like Virus.

- [48973] VGAM1398 precursor RNA folds onto itself, forming VGAM1398 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [48974] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1398 folded precursor RNA into VGAM1398 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1398 RNA is designated SEQ ID:4109, and is provided hereinbelow with reference to the sequence

listing part.

[48975] VGAM1398 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1398 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1398 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[48976] VGAM1398 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1398 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1398 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1398 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM1398 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[48977] The complementary binding of VGAM1398 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1398 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1398 host target RNA into VGAM1398 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[48978] It is appreciated that VGAM1398 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1398 host target genes. The mRNA of each one of this plurality of VGAM1398 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1398 RNA, herein designated VGAM

RNA, and which when bound by VGAM1398 RNA causes inhibition of translation of respective one or more VGAM1398 host target proteins.

[48979] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1398 gene, herein designated VGAM GENE, on one or more VGAM1398 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[48980] It is yet further appreciated that a function of VGAM1398 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1398 include diagnosis, prevention and treatment of viral infection by Perina Nuda Picorna-like Virus. Specific functions, and accordingly utilities, of VGAM1398 correlate with, and may be deduced from, the identity of the host target genes which VGAM1398 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[48981] Nucleotide sequences of the VGAM1398 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1398 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1398 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1398 are further described hereinbelow with reference to Table 1.

[48982] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1398 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1398 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[48983] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1398 gene, herein designated VGAM is

inhibition of expression of VGAM1398 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1398 correlate with, and may be deduced from, the identity of the target genes which VGAM1398 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[48984] ATPase, Na⁺/K⁺ Transporting, Beta 2 Polypeptide (ATP1B2, Accession NM_001678) is a VGAM1398 host target gene. ATP1B2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP1B2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP1B2 BINDING SITE, designated SEQ ID:7387, to the nucleotide sequence of VGAM1398 RNA, herein designated VGAM RNA, also designated SEQ ID:4109.

[48985] A function of VGAM1398 is therefore inhibition of ATPase, Na⁺/K⁺ Transporting, Beta 2 Polypeptide (ATP1B2, Accession NM_001678), a gene which catalyzes the hydrolysis of ATP coupled with the exchange of Na⁺/K⁺ ions across the plasma membrane. Accordingly, utilities of VGAM1398 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with ATP1B2. The function of ATP1B2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM152. Contactin Associated Protein-like 2 (CNTNAP2, Accession NM_014141) is another VGAM1398 host target gene. CNTNAP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CNTNAP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNTNAP2 BINDING SITE, designated SEQ ID:15412, to the nucleotide sequence of VGAM1398 RNA, herein designated VGAM RNA, also designated SEQ ID:4109.

[48986] Another function of VGAM1398 is therefore inhibition of Contactin Associated Protein-like 2 (CNTNAP2, Accession NM_014141). Accordingly, utilities of VGAM1398 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNTNAP2. Cathepsin L (CTSL, Accession NM_001912) is another VGAM1398 host target gene. CTSL BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded

by CTSL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CTSL BINDING SITE, designated SEQ ID:7628, to the nucleotide sequence of VGAM1398 RNA, herein designated VGAM RNA, also designated SEQ ID:4109.

[48987] Another function of VGAM1398 is therefore inhibition of Cathepsin L (CTSL, Accession NM_001912). Accordingly, utilities of VGAM1398 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CTSL. GATA Binding Protein 2 (GATA2, Accession NM_002050) is another VGAM1398 host target gene. GATA2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GATA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GATA2 BINDING SITE, designated SEQ ID:7801, to the nucleotide sequence of VGAM1398 RNA, herein designated VGAM RNA, also designated SEQ ID:4109.

[48988] Another function of VGAM1398 is therefore inhibition of GATA Binding Protein 2 (GATA2, Accession NM_002050).

Accordingly, utilities of VGAM1398 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GATA2. Interleukin 1, Alpha (IL1A, Accession XM_031221) is another VGAM1398 host target gene. IL1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL1A BINDING SITE, designated SEQ ID:31307, to the nucleotide sequence of VGAM1398 RNA, herein designated VGAM RNA, also designated SEQ ID:4109.

[48989] Another function of VGAM1398 is therefore inhibition of Interleukin 1, Alpha (IL1A, Accession XM_031221), a gene which stimulates thymocyte proliferation by inducing il-2 release, b-cell maturation & proliferation, & fibroblast growth factor activity. Accordingly, utilities of VGAM1398 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL1A. The function of IL1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM475.IMP (inosine monophosphate) Dehydrogenase 1 (IMPDH1, Ac-

cession NM_000883) is another VGAM1398 host target gene. IMPDH1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by IMPDH1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IMPDH1 BINDING SITE, designated SEQ ID:6577, to the nucleotide sequence of VGAM1398 RNA, herein designated VGAM RNA, also designated SEQ ID:4109.

[48990] Another function of VGAM1398 is therefore inhibition of IMP (inosine monophosphate) Dehydrogenase 1 (IMPDH1, Accession NM_000883). Accordingly, utilities of VGAM1398 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IMPDH1. Proprotein Convertase Subtilisin/kexin Type 1 (PCSK1, Accession NM_000439) is another VGAM1398 host target gene. PCSK1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PCSK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCSK1 BINDING SITE, des-

ignated SEQ ID:6023, to the nucleotide sequence of VGAM1398 RNA, herein designated VGAM RNA, also designated SEQ ID:4109.

[48991] Another function of VGAM1398 is therefore inhibition of Proprotein Convertase Subtilisin/kexin Type 1 (PCSK1, Accession NM_000439), a gene which processes hormone precursors by cleaving paired basic amino acids; serine protease of the subtilase family. Accordingly, utilities of VGAM1398 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCSK1. The function of PCSK1 has been established by previous studies. A wide variety of biologically important polypeptides including hormones, enzymes, and receptors are initially synthesized as large inactive precursors. To release the active component(s), these precursors must undergo limited proteolysis at pairs of basic residues by specific convertases. There is, for example, a diarginyl-specific proalbumin convertase (see OMIM Ref. No. comment in 103600). Three mammalian convertases, PC1 (PCSK1; also known as PC3), PC2 (PCSK2; 162151), and furin (OMIM Ref. No. 136950), belonging to the family of serine proteinases of the subtilisin family, are prohormone and proprotein convertases. PC1 and PC2, known also as NEC1

and NEC2 (for neuroendocrine convertase 1 and 2, respectively), differentially cleave proopiomelanocortin (POMC; 176830). Proinsulin is converted to insulin (OMIM Ref. No. 176730) by the concerted action of PC2 and PC3. Furin is a specific proteinase capable of activating the beta subunit of pro-NGF (OMIM Ref. No. 162030) and von Willebrand factor (OMIM Ref. No. 193400). By in situ hybridization, Seidah et al. (1991) mapped NEC1 to human 5q15-q21 and to mouse chromosome 13. Copeland et al. (1992) refined the regional localization on mouse chromosome 13. Ohagi et al. (1996) stated that PC2 is responsible for cleavage of the C-peptide/A-chain junction of the proinsulin molecule, whereas PC3 cleaves the proinsulin molecule on the C-terminal side of the dibasic peptide, arg31-arg32, joining the B-chain and C-peptide. PC3 plays a key role in regulating insulin biosynthesis by initiating the sequential processing. Expression of insulin and PC3, but not PC2, is coordinately regulated by glucose, consistent with the important role of PC3 in regulating proinsulin processing. Noninsulin-dependent diabetes mellitus (NIDDM; 125853) is associated with increased secretion of proinsulin and proinsulin-like molecules, suggesting that mutations in the PC3 gene may be involved in

the development of this disorder. Ohagi et al. (1996) showed that the human PC3 gene consists of 14 exons spanning more than 35 kb. The exon/intron organization of the PC2 and PC3 genes are conserved, consistent with a common evolutionary origin. Screening for mutations in the PC3 gene in Japanese subjects with NIDDM using SSCP analysis and nucleotide sequencing of the entire coding region, Ohagi et al. (1996) could find no mutation associated with NIDDM. A mutation in carboxypeptidase E (CPE; 114855), an enzyme active in the processing and sorting of prohormones, causes obesity in the fat/fat mouse (Naggert et al., 1995; Cool et al., 1997). The gene products of CPE and PC1 cooperate in prohormone processing. Mutations in the CPE gene had not been demonstrated in human obesity. However, Jackson et al. (1997) demonstrated mutations in the prohormone convertase 1 gene, which acts proximally to CPE in the pathway of posttranslational processing of prohormones and neuropeptides. The subject was a 43-year-old woman with extreme childhood obesity, abnormal glucose homeostasis, hypogonadotropic hypogonadism, hypocortisolism, and elevated plasma proinsulin and POMC concentrations, but very low insulin levels, all suggestive of defective prohormone pro-

cessing by the patient's PC1. The patient had been described clinically by O'Rahilly et al. (1995); see 600955. The patient was found to be a compound heterozygote for mutations in PC1. Heteroallelism of the patient was confirmed by the fact that 1 substitution (162150.0001) was found in 3 of the proband's 4 children, all of whom were clinically unaffected; the fourth child had the other mutation, a splice site defect (162150.0002). The proband's fasting serum leptin (OMIM Ref. No. 164160) concentration was appropriate for her body mass index. There was a close similarity of phenotype between the proband and the fat/fat mouse.

[48992] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[48993] Ohagi, S.; Sakaguchi, H.; Sanke, T.; Tatsuta, H.; Hanabusa, T.; Nanjo, K. : Human prohormone convertase 3 gene: exon-intron organization and molecular scanning for mutations in Japanese subjects with NIDDM. Diabetes 45: 897-901, 1996. ; and

[48994] O'Rahilly, S.; Gray, H.; Humphreys, P. J.; Krook, A.; Polonsky, K. S.; White, A.; Gibson, S.; Taylor, K.; Carr, C. : Brief report: impaired processing of prohormones associated

with abno.

[48995] Further studies establishing the function and utilities of PCSK1 are found in John Hopkins OMIM database record ID 162150, and in cited publications numbered 1712, 3577–195 and 3583 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. BICD2 (Accession XM_046863) is another VGAM1398 host target gene. BICD2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BICD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BICD2 BINDING SITE, designated SEQ ID:34851, to the nucleotide sequence of VGAM1398 RNA, herein designated VGAM RNA, also designated SEQ ID:4109.

[48996] Another function of VGAM1398 is therefore inhibition of BICD2 (Accession XM_046863). Accordingly, utilities of VGAM1398 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BICD2. FLJ31709 (Accession NM_144636) is another VGAM1398 host target gene. FLJ31709 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by FLJ31709, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ31709 BINDING SITE, designated SEQ ID:29456, to the nucleotide sequence of VGAM1398 RNA, herein designated VGAM RNA, also designated SEQ ID:4109.

[48997] Another function of VGAM1398 is therefore inhibition of FLJ31709 (Accession NM_144636). Accordingly, utilities of VGAM1398 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31709. KIAA0285 (Accession NM_014807) is another VGAM1398 host target gene. KIAA0285 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0285, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0285 BINDING SITE, designated SEQ ID:16745, to the nucleotide sequence of VGAM1398 RNA, herein designated VGAM RNA, also designated SEQ ID:4109.

[48998] Another function of VGAM1398 is therefore inhibition of KIAA0285 (Accession NM_014807). Accordingly, utilities

of VGAM1398 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0285. KIAA0367 (Accession XM_041018) is another VGAM1398 host target gene. KIAA0367 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0367, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0367 BINDING SITE, designated SEQ ID:33423, to the nucleotide sequence of VGAM1398 RNA, herein designated VGAM RNA, also designated SEQ ID:4109.

[48999] Another function of VGAM1398 is therefore inhibition of KIAA0367 (Accession XM_041018). Accordingly, utilities of VGAM1398 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0367. KIAA1649 (Accession NM_032311) is another VGAM1398 host target gene. KIAA1649 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1649, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA1649 BINDING SITE, designated SEQ ID:26114, to the nucleotide sequence of VGAM1398 RNA, herein designated VGAM RNA, also designated SEQ ID:4109.

[49000] Another function of VGAM1398 is therefore inhibition of KIAA1649 (Accession NM_032311). Accordingly, utilities of VGAM1398 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1649. MGC2306 (Accession NM_032638) is another VGAM1398 host target gene. MGC2306 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC2306, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2306 BINDING SITE, designated SEQ ID:26350, to the nucleotide sequence of VGAM1398 RNA, herein designated VGAM RNA, also designated SEQ ID:4109.

[49001] Another function of VGAM1398 is therefore inhibition of MGC2306 (Accession NM_032638). Accordingly, utilities of VGAM1398 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2306. POMT2 (Accession NM_013382) is another VGAM1398 host target gene. POMT2 BINDING SITE is

HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by POMT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POMT2 BINDING SITE, designated SEQ ID:15034, to the nucleotide sequence of VGAM1398 RNA, herein designated VGAM RNA, also designated SEQ ID:4109.

[49002] Another function of VGAM1398 is therefore inhibition of POMT2 (Accession NM_013382). Accordingly, utilities of VGAM1398 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POMT2. PRO2032 (Accession NM_018615) is another VGAM1398 host target gene. PRO2032 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRO2032, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2032 BINDING SITE, designated SEQ ID:20684, to the nucleotide sequence of VGAM1398 RNA, herein designated VGAM RNA, also designated SEQ ID:4109.

[49003] Another function of VGAM1398 is therefore inhibition of

PRO2032 (Accession NM_018615). Accordingly, utilities of VGAM1398 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2032. RAB20, Member RAS Oncogene Family (RAB20, Accession NM_017817) is another VGAM1398 host target gene. RAB20 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by RAB20, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB20 BINDING SITE, designated SEQ ID:19464, to the nucleotide sequence of VGAM1398 RNA, herein designated VGAM RNA, also designated SEQ ID:4109.

[49004] Another function of VGAM1398 is therefore inhibition of RAB20, Member RAS Oncogene Family (RAB20, Accession NM_017817). Accordingly, utilities of VGAM1398 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB20. Tumor Protein D52 (TPD52, Accession NM_005079) is another VGAM1398 host target gene. TPD52 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TPD52, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TPD52 BINDING SITE, designated SEQ ID:11531, to the nucleotide sequence of VGAM1398 RNA, herein designated VGAM RNA, also designated SEQ ID:4109.

[49005] Another function of VGAM1398 is therefore inhibition of Tumor Protein D52 (TPD52, Accession NM_005079). Accordingly, utilities of VGAM1398 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TPD52. LOC115399 (Accession XM_055874) is another VGAM1398 host target gene. LOC115399 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC115399, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115399 BINDING SITE, designated SEQ ID:36344, to the nucleotide sequence of VGAM1398 RNA, herein designated VGAM RNA, also designated SEQ ID:4109.

[49006] Another function of VGAM1398 is therefore inhibition of LOC115399 (Accession XM_055874). Accordingly, utilities

of VGAM1398 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115399. LOC146243 (Accession XM_096956) is another VGAM1398 host target gene. LOC146243 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146243, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146243 BINDING SITE, designated SEQ ID:40674, to the nucleotide sequence of VGAM1398 RNA, herein designated VGAM RNA, also designated SEQ ID:4109.

[49007] Another function of VGAM1398 is therefore inhibition of LOC146243 (Accession XM_096956). Accordingly, utilities of VGAM1398 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146243. LOC148293 (Accession XM_086138) is another VGAM1398 host target gene. LOC148293 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148293, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC148293 BINDING SITE, designated SEQ ID:38517, to the nucleotide sequence of VGAM1398 RNA, herein designated VGAM RNA, also designated SEQ ID:4109.

[49008] Another function of VGAM1398 is therefore inhibition of LOC148293 (Accession XM_086138). Accordingly, utilities of VGAM1398 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148293. LOC256073 (Accession XM_172972) is another VGAM1398 host target gene. LOC256073 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256073, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256073 BINDING SITE, designated SEQ ID:46227, to the nucleotide sequence of VGAM1398 RNA, herein designated VGAM RNA, also designated SEQ ID:4109.

[49009] Another function of VGAM1398 is therefore inhibition of LOC256073 (Accession XM_172972). Accordingly, utilities of VGAM1398 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256073. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 1399 (VGAM1399) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49010] VGAM1399 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1399 was detected is described hereinabove with reference to Figs. 1–8.

[49011] VGAM1399 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Perina Nuda Picorna-like Virus. VGAM1399 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49012] VGAM1399 gene encodes a VGAM1399 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1399 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1399 precursor RNA is designated SEQ ID:1385, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1385 is located at position 2981 relative to the

genome of Perina Nuda Picorna-like Virus.

[49013] VGAM1399 precursor RNA folds onto itself, forming VGAM1399 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49014] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1399 folded precursor RNA into VGAM1399 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1399 RNA is designated SEQ ID:4110, and is provided hereinbelow with reference to the sequence listing part.

[49015] VGAM1399 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1399 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1399 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[49016] VGAM1399 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1399 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1399 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1399 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1399 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[49017] The complementary binding of VGAM1399 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1399 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1399 host target RNA into VGAM1399 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49018] It is appreciated that VGAM1399 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1399 host target genes. The mRNA of each one of this plurality of VGAM1399 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1399 RNA, herein designated VGAM RNA, and which when bound by VGAM1399 RNA causes inhibition of translation of respective one or more VGAM1399 host target proteins.

[49019] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1399 gene, herein designated VGAM GENE, on one or more VGAM1399 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[49020] It is yet further appreciated that a function of VGAM1399 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1399 include diagnosis, prevention and treatment of viral infection by Perina Nuda Picorna-like Virus. Specific functions, and accordingly utilities, of

VGAM1399 correlate with, and may be deduced from, the identity of the host target genes which VGAM1399 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49021] Nucleotide sequences of the VGAM1399 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1399 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1399 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1399 are further described hereinbelow with reference to Table 1.

[49022] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1399 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1399 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49023] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1399 gene, herein designated VGAM is inhibition of expression of VGAM1399 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1399 correlate with, and may be deduced

from, the identity of the target genes which VGAM1399 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[49024] Membrane Protein, Palmitoylated 6 (MAGUK p55 subfamily member 6) (MPP6, Accession NM_016447) is a VGAM1399 host target gene. MPP6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MPP6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MPP6 BINDING SITE, designated SEQ ID:18566, to the nucleotide sequence of VGAM1399 RNA, herein designated VGAM RNA, also designated SEQ ID:4110.

[49025] A function of VGAM1399 is therefore inhibition of Membrane Protein, Palmitoylated 6 (MAGUK p55 subfamily member 6) (MPP6, Accession NM_016447), a gene which may regulate transmembrane proteins that bind calcium, calmodulin, or nucleotides. Accordingly, utilities of VGAM1399 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MPP6. The function of MPP6 has been established by previous studies. By searching an EST database with DLG2 (OMIM

Ref. No. 603583) as the probe, followed by PCR of a brain cDNA library and 5-prime RACE, Tseng et al. (2001) obtained a cDNA encoding MPP6, which they called VAM1 for VELI (OMIM Ref. No. 603380)-associated MAGUK-1. The deduced 540-amino acid protein has a single PDZ domain, a central SH3 domain, and a C-terminal GUK domain, resembling other members of the p55 MAGUK subfamily. Like MPP1, MPP6 also contains a protein 4.1 (EPB41; 130500)-binding domain with its characteristic KKKK sequence, as well as a leucine zipper and 2 phosphorylation sites. Northern blot analysis revealed expression of an abundant 2.3-kb transcript and a minor 4.2-kb transcript only in testis. RT-PCR analysis detected predominant expression in testis, with lower amounts in ovary, prostate, thymus, small intestine, and several other tissues; VELI has a similar expression pattern. GST pull-down and mutation analyses indicated that a domain N-terminal of the PDZ region of VAM1 contains the minimal VELI-binding sequence. No binding between VAM1 and EPB41 was detected. Kamberov et al. (2000) cloned and characterized the mouse Mpp5 (OMIM Ref. No. 606958) and Mpp6 genes, which they called Pals1 and Pals2, respectively. The Pals proteins bind to mouse Lin7 (VELI)

through a region N-terminal to their PDZ domains.

[49026] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[49027] Kamberov, E.; Makarova, O.; Roh, M.; Liu, A.; Karnak, D.; Straight, S.; Margolis, B. : Molecular cloning and characterization of Pals, proteins associated with mLin-7. J. Biol. Chem. 275: 11425-11431, 2000. ; and

[49028] Tseng, T.-C.; Marfatia, S. M.; Bryant, P. J.; Pack, S.; Zhuang, A.; O'Brien, J. E.; Lin, L.; Hanada, T.; Chishti, A. H. : VAM-1: a new member of the MAGUK family binds to human Veli-1.

[49029] Further studies establishing the function and utilities of MPP6 are found in John Hopkins OMIM database record ID 606959, and in cited publications numbered 5138-5139 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. FLJ10326 (Accession NM_018060) is another VGAM1399 host target gene. FLJ10326 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10326, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of FLJ10326 BINDING SITE, designated SEQ ID:19829, to the nucleotide sequence of VGAM1399 RNA, herein designated VGAM RNA, also designated SEQ ID:4110.

[49030] Another function of VGAM1399 is therefore inhibition of FLJ10326 (Accession NM_018060). Accordingly, utilities of VGAM1399 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10326. KIAA1111 (Accession XM_171233) is another VGAM1399 host target gene. KIAA1111 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1111, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1111 BINDING SITE, designated SEQ ID:46018, to the nucleotide sequence of VGAM1399 RNA, herein designated VGAM RNA, also designated SEQ ID:4110.

[49031] Another function of VGAM1399 is therefore inhibition of KIAA1111 (Accession XM_171233). Accordingly, utilities of VGAM1399 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1111. MGC32104 (Accession NM_144684) is another

VGAM1399 host target gene. MGC32104 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC32104, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC32104 BINDING SITE, designated SEQ ID:29507, to the nucleotide sequence of VGAM1399 RNA, herein designated VGAM RNA, also designated SEQ ID:4110.

[49032] Another function of VGAM1399 is therefore inhibition of MGC32104 (Accession NM_144684). Accordingly, utilities of VGAM1399 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC32104. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1400 (VGAM1400) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49033] VGAM1400 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1400 was detected is de-

scribed hereinabove with reference to Figs. 1–8.

[49034] VGAM1400 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Perina Nuda Picorna–like Virus. VGAM1400 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49035] VGAM1400 gene encodes a VGAM1400 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1400 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1400 precursor RNA is designated SEQ ID:1386, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1386 is located at position 2576 relative to the genome of Perina Nuda Picorna–like Virus.

[49036] VGAM1400 precursor RNA folds onto itself, forming VGAM1400 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA

gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49037] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1400 folded precursor RNA into VGAM1400 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1400 RNA is designated SEQ ID:4111, and is provided hereinbelow with reference to the sequence listing part.

[49038] VGAM1400 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1400 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1400 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[49039] VGAM1400 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1400 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1400 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1400 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1400 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[49040] The complementary binding of VGAM1400 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1400 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1400 host target RNA into VGAM1400 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49041] It is appreciated that VGAM1400 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1400 host target genes. The mRNA of each one of this plurality of VGAM1400 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1400 RNA, herein designated VGAM RNA, and which when bound by VGAM1400 RNA causes inhibition of translation of respective one or more VGAM1400 host target proteins.

[49042] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1400 gene, herein designated VGAM GENE, on one or more VGAM1400 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[49043] It is yet further appreciated that a function of VGAM1400 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1400 include diagnosis, prevention and treatment of viral infection by Perina Nuda Picorna-like Virus. Specific functions, and accordingly utilities, of VGAM1400 correlate with, and may be deduced from, the identity of the host target genes which VGAM1400 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49044] Nucleotide sequences of the VGAM1400 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1400 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM1400 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1400 are further described hereinbelow with reference to Table 1.

[49045] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1400 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1400 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49046] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1400 gene, herein designated VGAM is inhibition of expression of VGAM1400 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1400 correlate with, and may be deduced from, the identity of the target genes which VGAM1400 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[49047] KIAA0379 (Accession XM_042860) is a VGAM1400 host target gene. KIAA0379 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0379, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0379 BINDING SITE, designated SEQ ID:33811, to the nucleotide sequence of VGAM1400 RNA, herein designated VGAM RNA, also designated SEQ ID:4111.

[49048] A function of VGAM1400 is therefore inhibition of KIAA0379 (Accession XM_042860). Accordingly, utilities of VGAM1400 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0379. KIAA1610 (Accession XM_040622) is another VGAM1400 host target gene. KIAA1610 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1610, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1610 BINDING SITE, designated SEQ ID:33340, to the nucleotide sequence of VGAM1400 RNA, herein designated VGAM RNA, also designated SEQ ID:4111.

[49049] Another function of VGAM1400 is therefore inhibition of KIAA1610 (Accession XM_040622). Accordingly, utilities of VGAM1400 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1610. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1401 (VGAM1401) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49050] VGAM1401 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1401 was detected is described hereinabove with reference to Figs. 1–8.

[49051] VGAM1401 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Perina Nuda Picorna-like Virus. VGAM1401 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49052] VGAM1401 gene encodes a VGAM1401 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1401 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1401 precursor RNA is designated SEQ ID:1387, and is provided hereinbelow with ref–

erence to the sequence listing part. Nucleotide sequence SEQ ID:1387 is located at position 7823 relative to the genome of Perina Nuda Picorna-like Virus.

[49053] VGAM1401 precursor RNA folds onto itself, forming VGAM1401 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49054] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1401 folded precursor RNA into VGAM1401 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1401 RNA is designated SEQ ID:4112, and is provided hereinbelow with reference to the sequence listing part.

[49055] VGAM1401 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1401 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1401 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[49056] VGAM1401 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1401 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1401 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1401 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM1401 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[49057] The complementary binding of VGAM1401 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1401 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1401 host target RNA into VGAM1401 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49058] It is appreciated that VGAM1401 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1401 host target genes. The mRNA of each one of this plurality of VGAM1401 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1401 RNA, herein designated VGAM RNA, and which when bound by VGAM1401 RNA causes

inhibition of translation of respective one or more VGAM1401 host target proteins.

[49059] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1401 gene, herein designated VGAM GENE, on one or more VGAM1401 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[49060] It is yet further appreciated that a function of VGAM1401 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1401 include diagnosis, prevention and

treatment of viral infection by Perina Nuda Picorna-like Virus. Specific functions, and accordingly utilities, of VGAM1401 correlate with, and may be deduced from, the identity of the host target genes which VGAM1401 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49061] Nucleotide sequences of the VGAM1401 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1401 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1401 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1401 are further described hereinbelow with reference to Table 1.

[49062] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1401 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1401 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49063] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1401 gene, herein designated VGAM is inhibition of expression of VGAM1401 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM1401 correlate with, and may be deduced from, the identity of the target genes which VGAM1401 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[49064] Hypoxia-inducible Factor 1, Alpha Subunit (basic helix-loop-helix transcription factor) (HIF1A, Accession NM_001530) is a VGAM1401 host target gene. HIF1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HIF1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HIF1A BINDING SITE, designated SEQ ID:7269, to the nucleotide sequence of VGAM1401 RNA, herein designated VGAM RNA, also designated SEQ ID:4112.

[49065] A function of VGAM1401 is therefore inhibition of Hypoxia-inducible Factor 1, Alpha Subunit (basic helix-loop-helix transcription factor) (HIF1A, Accession NM_001530), a gene which is a basic helix-loop-helix transcription factor and mediates transcriptional responses to hypoxia and dioxin-signaling. Accordingly, utilities of VGAM1401 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with HIF1A. The function of HIF1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM229. Potassium Voltage-gated Channel, Delayed-rectifier, Subfamily S, Member 2 (KCNS2, Accession XM_043106) is another VGAM1401 host target gene. KCNS2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KCNS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNS2 BINDING SITE, designated SEQ ID:33897, to the nucleotide sequence of VGAM1401 RNA, herein designated VGAM RNA, also designated SEQ ID:4112.

[49066] Another function of VGAM1401 is therefore inhibition of Potassium Voltage-gated Channel, Delayed-rectifier, Subfamily S, Member 2 (KCNS2, Accession XM_043106), a gene which mediates the voltage-dependent potassium ion permeability of excitable membranes. Accordingly, utilities of VGAM1401 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with KCNS2. The function of KCNS2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM419. RB1-inducible Coiled-coil 1 (RB1CC1, Accession NM_014781) is another VGAM1401 host target gene. RB1CC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RB1CC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RB1CC1 BINDING SITE, designated SEQ ID:16632, to the nucleotide sequence of VGAM1401 RNA, herein designated VGAM RNA, also designated SEQ ID:4112.

[49067] Another function of VGAM1401 is therefore inhibition of RB1-inducible Coiled-coil 1 (RB1CC1, Accession NM_014781), a gene which is likely to participate in nuclear architecture by connecting chromatin with the nuclear matrix or envelope. Accordingly, utilities of VGAM1401 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RB1CC1. The function of RB1CC1 and its association with various diseases and clinical conditions, has been estab-

lished by previous studies, as described hereinabove with reference to VGAM18. Sterol-C5-desaturase (ERG3 delta-5-desaturase homolog, fungal)-like (SC5DL, Accession XM_165583) is another VGAM1401 host target gene.

SC5DL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SC5DL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SC5DL BINDING SITE, designated SEQ ID:43697, to the nucleotide sequence of VGAM1401 RNA, herein designated VGAM RNA, also designated SEQ ID:4112.

[49068] Another function of VGAM1401 is therefore inhibition of Sterol-C5-desaturase (ERG3 delta-5-desaturase homolog, fungal)-like (SC5DL, Accession XM_165583). Accordingly, utilities of VGAM1401 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SC5DL. Secreted Frizzled-related Protein 4 (SFRP4, Accession NM_003014) is another VGAM1401 host target gene. SFRP4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SFRP4, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SFRP4 BINDING SITE, designated SEQ ID:8939, to the nucleotide sequence of VGAM1401 RNA, herein designated VGAM RNA, also designated SEQ ID:4112.

[49069] Another function of VGAM1401 is therefore inhibition of Secreted Frizzled-related Protein 4 (SFRP4, Accession NM_003014). Accordingly, utilities of VGAM1401 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFRP4. Short Stature Homeobox (SHOX, Accession NM_000451) is another VGAM1401 host target gene. SHOX BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SHOX, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SHOX BINDING SITE, designated SEQ ID:6057, to the nucleotide sequence of VGAM1401 RNA, herein designated VGAM RNA, also designated SEQ ID:4112.

[49070] Another function of VGAM1401 is therefore inhibition of Short Stature Homeobox (SHOX, Accession NM_000451).

Accordingly, utilities of VGAM1401 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SHOX. SudD Suppressor of BimD6 Homolog (*A. nidulans*) (SUDD, Accession NM_003831) is another VGAM1401 host target gene. SUDD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SUDD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SUDD BINDING SITE, designated SEQ ID:9923, to the nucleotide sequence of VGAM1401 RNA, herein designated VGAM RNA, also designated SEQ ID:4112.

[49071] Another function of VGAM1401 is therefore inhibition of SudD Suppressor of BimD6 Homolog (*A. nidulans*) (SUDD, Accession NM_003831). Accordingly, utilities of VGAM1401 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SUDD. SUV39H2 (Accession NM_024670) is another VGAM1401 host target gene. SUV39H2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SUV39H2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SUV39H2 BINDING SITE, designated SEQ ID:23976, to the nucleotide sequence of VGAM1401 RNA, herein designated VGAM RNA, also designated SEQ ID:4112.

[49072] Another function of VGAM1401 is therefore inhibition of SUV39H2 (Accession NM_024670), a gene which is involved in gene repression and the modification of position-effect-variegation. Accordingly, utilities of VGAM1401 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SUV39H2. The function of SUV39H2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM424. Ubiquitin-like 3 (UBL3, Accession NM_007106) is another VGAM1401 host target gene. UBL3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UBL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBL3 BINDING SITE, designated SEQ ID:13967, to the nucleotide sequence of VGAM1401 RNA, herein

designated VGAM RNA, also designated SEQ ID:4112.

[49073] Another function of VGAM1401 is therefore inhibition of Ubiquitin-like 3 (UBL3, Accession NM_007106), a gene which appears to have a diverse range of cellular functions. Accordingly, utilities of VGAM1401 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBL3. The function of UBL3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM459.FLJ23074 (Accession NM_025052) is another VGAM1401 host target gene. FLJ23074 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23074, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23074 BINDING SITE, designated SEQ ID:24650, to the nucleotide sequence of VGAM1401 RNA, herein designated VGAM RNA, also designated SEQ ID:4112.

[49074] Another function of VGAM1401 is therefore inhibition of FLJ23074 (Accession NM_025052). Accordingly, utilities of VGAM1401 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ23074. SFRS Protein Kinase 1 (SRPK1, Accession NM_003137) is another VGAM1401 host target gene. SRPK1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SRPK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SRPK1 BINDING SITE, designated SEQ ID:9107, to the nucleotide sequence of VGAM1401 RNA, herein designated VGAM RNA, also designated SEQ ID:4112.

[49075] Another function of VGAM1401 is therefore inhibition of SFRS Protein Kinase 1 (SRPK1, Accession NM_003137). Accordingly, utilities of VGAM1401 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SRPK1. LOC158130 (Accession XM_044880) is another VGAM1401 host target gene. LOC158130 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC158130, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158130 BINDING SITE, desig-

nated SEQ ID:34302, to the nucleotide sequence of VGAM1401 RNA, herein designated VGAM RNA, also designated SEQ ID:4112.

[49076] Another function of VGAM1401 is therefore inhibition of LOC158130 (Accession XM_044880). Accordingly, utilities of VGAM1401 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158130. LOC202781 (Accession XM_117455) is another VGAM1401 host target gene. LOC202781 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC202781, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202781 BINDING SITE, designated SEQ ID:43442, to the nucleotide sequence of VGAM1401 RNA, herein designated VGAM RNA, also designated SEQ ID:4112.

[49077] Another function of VGAM1401 is therefore inhibition of LOC202781 (Accession XM_117455). Accordingly, utilities of VGAM1401 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202781. LOC221962 (Accession XM_166554) is another VGAM1401 host target gene. LOC221962 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221962, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221962 BINDING SITE, designated SEQ ID:44530, to the nucleotide sequence of VGAM1401 RNA, herein designated VGAM RNA, also designated SEQ ID:4112.

[49078] Another function of VGAM1401 is therefore inhibition of LOC221962 (Accession XM_166554). Accordingly, utilities of VGAM1401 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221962. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1402 (VGAM1402) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49079] VGAM1402 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1402 was detected is described hereinabove with reference to Figs. 1-8.

[49080] VGAM1402 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Perina Nuda Picorna-like Virus. VGAM1402 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49081] VGAM1402 gene encodes a VGAM1402 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1402 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1402 precursor RNA is designated SEQ ID:1388, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1388 is located at position 7345 relative to the genome of Perina Nuda Picorna-like Virus.

[49082] VGAM1402 precursor RNA folds onto itself, forming VGAM1402 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[49083] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1402 folded precursor RNA into VGAM1402 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM1402 RNA is designated SEQ ID:4113, and is provided hereinbelow with reference to the sequence listing part.

[49084] VGAM1402 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1402 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1402 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[49085] VGAM1402 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1402 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1402 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1402 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1402 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[49086] The complementary binding of VGAM1402 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1402 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1402 host target RNA into VGAM1402 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49087] It is appreciated that VGAM1402 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1402 host target genes. The mRNA of each one of this plurality of VGAM1402 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1402 RNA, herein designated VGAM RNA, and which when bound by VGAM1402 RNA causes inhibition of translation of respective one or more VGAM1402 host target proteins.

[49088] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1402 gene, herein designated VGAM GENE, on one or more VGAM1402 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[49089] It is yet further appreciated that a function of VGAM1402 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1402 include diagnosis, prevention and treatment of viral infection by Perina Nuda Picorna-like Virus. Specific functions, and accordingly utilities, of VGAM1402 correlate with, and may be deduced from, the identity of the host target genes which VGAM1402 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49090] Nucleotide sequences of the VGAM1402 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1402 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1402 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1402 are further described hereinbelow with reference to Table 1.

[49091] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1402 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1402 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49092] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1402 gene, herein designated VGAM is inhibition of expression of VGAM1402 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1402 correlate with, and may be deduced from, the identity of the target genes which VGAM1402 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[49093] LOC90342 (Accession XM_031009) is a VGAM1402 host target gene. LOC90342 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90342, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of LOC90342 BINDING SITE, designated SEQ ID:31248, to the nucleotide sequence of VGAM1402 RNA, herein designated VGAM RNA, also designated SEQ ID:4113.

[49094] A function of VGAM1402 is therefore inhibition of LOC90342 (Accession XM_031009). Accordingly, utilities of VGAM1402 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90342. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1403 (VGAM1403) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49095] VGAM1403 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1403 was detected is described hereinabove with reference to Figs. 1–8.

[49096] VGAM1403 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Perina Nuda Picorna-like Virus. VGAM1403 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in

the human genome.

[49097] VGAM1403 gene encodes a VGAM1403 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1403 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1403 precursor RNA is designated SEQ ID:1389, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1389 is located at position 7194 relative to the genome of Perina Nuda Picorna-like Virus.

[49098] VGAM1403 precursor RNA folds onto itself, forming VGAM1403 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49099] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1403 folded precursor RNA into VGAM1403 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1403 RNA is designated SEQ ID:4114, and is provided hereinbelow with reference to the sequence listing part.

[49100] VGAM1403 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1403 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1403 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[49101] VGAM1403 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1403 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1403 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1403 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1403 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[49102] The complementary binding of VGAM1403 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1403 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1403 host target RNA into VGAM1403 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49103] It is appreciated that VGAM1403 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1403 host target genes. The mRNA of each one of this plurality of VGAM1403 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1403 RNA, herein designated VGAM RNA, and which when bound by VGAM1403 RNA causes inhibition of translation of respective one or more VGAM1403 host target proteins.

[49104] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1403 gene, herein designated VGAM GENE, on one or more VGAM1403 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[49105] It is yet further appreciated that a function of VGAM1403 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1403 include diagnosis, prevention and treatment of viral infection by Perina Nuda Picorna-like Virus. Specific functions, and accordingly utilities, of VGAM1403 correlate with, and may be deduced from, the identity of the host target genes which VGAM1403 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49106] Nucleotide sequences of the VGAM1403 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1403 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1403 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1403 are further described hereinbelow with reference to Table 1.

[49107] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM1403 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1403 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49108] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1403 gene, herein designated VGAM is inhibition of expression of VGAM1403 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1403 correlate with, and may be deduced from, the identity of the target genes which VGAM1403 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[49109] Amyotrophic Lateral Sclerosis 2 (juvenile) (ALS2, Accession NM_020919) is a VGAM1403 host target gene. ALS2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ALS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ALS2 BINDING SITE, designated SEQ ID:21928, to the nucleotide sequence of VGAM1403 RNA, herein designated VGAM RNA, also designated SEQ ID:4114.

[49110] A function of VGAM1403 is therefore inhibition of Amyotrophic Lateral Sclerosis 2 (juvenile) (ALS2, Accession NM_020919). Accordingly, utilities of VGAM1403 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALS2. Aquaporin 6, Kidney Specific (AQP6, Accession NM_053286) is another VGAM1403 host target gene. AQP6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AQP6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AQP6 BINDING SITE, designated SEQ ID:27611, to the nucleotide sequence of VGAM1403 RNA, herein designated VGAM RNA, also designated SEQ ID:4114.

[49111] Another function of VGAM1403 is therefore inhibition of Aquaporin 6, Kidney Specific (AQP6, Accession NM_053286), a gene which participates in distinct physiologic function such as glomerular filtration, tubular endocytosis, and acid-base metabolism. Accordingly, utilities of VGAM1403 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AQP6. The function of AQP6 and its association with vari-

ous diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM340. Cadherin 1, Type 1, E-cadherin (epithelial) (CDH1, Accession NM_004360) is another VGAM1403 host target gene. CDH1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CDH1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDH1 BINDING SITE, designated SEQ ID:10563, to the nucleotide sequence of VGAM1403 RNA, herein designated VGAM RNA, also designated SEQ ID:4114.

[49112] Another function of VGAM1403 is therefore inhibition of Cadherin 1, Type 1, E-cadherin (epithelial) (CDH1, Accession NM_004360). Accordingly, utilities of VGAM1403 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDH1. Cytochrome P450, Subfamily VIIB (sterol 12- α -hydroxylase), Polypeptide 1 (CYP8B1, Accession NM_004391) is another VGAM1403 host target gene. CYP8B1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CYP8B1, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYP8B1 BINDING SITE, designated SEQ ID:10623, to the nucleotide sequence of VGAM1403 RNA, herein designated VGAM RNA, also designated SEQ ID:4114.

[49113] Another function of VGAM1403 is therefore inhibition of Cytochrome P450, Subfamily VIII B (sterol 12- α -hydroxylase), Polypeptide 1 (CYP8B1, Accession NM_004391), a gene which functions in bile acid biosynthesis. Accordingly, utilities of VGAM1403 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP8B1. The function of CYP8B1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM923. Eukaryotic Translation Initiation Factor 4 Gamma, 1 (EIF4G1, Accession NM_004953) is another VGAM1403 host target gene. EIF4G1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by EIF4G1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of EIF4G1 BINDING SITE, designated SEQ ID:11396, to the nucleotide sequence of VGAM1403 RNA, herein designated VGAM RNA, also designated SEQ ID:4114.

[49114] Another function of VGAM1403 is therefore inhibition of Eukaryotic Translation Initiation Factor 4 Gamma, 1 (EIF4G1, Accession NM_004953), a gene which is a Translation initiation factor. Accordingly, utilities of VGAM1403 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EIF4G1. The function of EIF4G1 has been established by previous studies. Gradi et al. (1998) identified a second human eIF4G gene. They designated the original gene eIF4GI and the novel gene eIF4GII (EIF4G3; 603929). Imataka et al. (1998) found that the human eIF4GI protein contains an additional 156 N-terminal amino acids compared to the sequence published by Yan et al. (1992). They demonstrated that this N-terminal region binds poly(A)-binding protein (PABP; 604679). In an in vitro translation system, an N-terminal fragment of eIF4GI that included the PABP-binding site inhibited poly(A)-dependent translation, but had no effect on translation of a deadenylated mRNA. Imataka et al. (1998) concluded that eIF4G probably func-

tions in poly(A)–dependent translation in mammalian cells. By screening a rabbit brain library with oligonucleotide probes based on the sequence of rabbit eIF4–gamma peptides, Yan et al. (1992) identified partial eIF4–gamma cDNAs. They used the rabbit cDNAs as probes and isolated human brain cDNAs encoding eIF4–gamma. The predicted human protein contains 1,396 amino acids. Western blot analysis of poliovirus–infected HeLa cell extracts revealed that eIF4–gamma has an apparent molecular weight of 200 to 220 kD and is cleaved by this picornavirus. Imataka and Sonenberg (1997) stated that the N–terminal region of eIF4G contains a binding site for eIF4E. They demonstrated that the central third of eIF4G contains an eIF3 (see OMIM Ref. No. 602039)–binding region and an eIF4A–binding domain. A second, separate eIF4A–binding site is present in the C–terminal third. Neither eIF4A–binding domain alone activates translation. In contrast to eIF4G, the eIF4G–related translation regulator p97 (OMIM Ref. No. 602325) binds eIF4A only through its N–terminal domain, which is homologous to the central domain of eIF4G

[49115] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [49116] Imataka, H.; Gradi, A.; Sonenberg, N. : A newly identified N-terminal amino acid sequence of human eIF4G binds poly(A)-binding protein and functions in poly(A)-dependent translation. EMBO J. 17: 7480-7489, 1998. ; and
- [49117] Imataka, H.; Sonenberg, N. : Human eukaryotic translation initiation factor 4G (eIF4G) possesses two separate and independent binding sites for eIF4A. Molec. Cell. Biol. 17: 6940-6947.
- [49118] Further studies establishing the function and utilities of EIF4G1 are found in John Hopkins OMIM database record ID 600495, and in cited publications numbered 10197-10200, 821 and 10201-10202 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Solute Carrier Family 1 (neutral amino acid transporter), Member 5 (SLC1A5, Accession NM_005628) is another VGAM1403 host target gene. SLC1A5 BINDING SITE1 and SLC1A5 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SLC1A5, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the comple-

mentarity of the nucleotide sequences of SLC1A5 BINDING SITE1 and SLC1A5 BINDING SITE2, designated SEQ ID:12141 and SEQ ID:38401 respectively, to the nucleotide sequence of VGAM1403 RNA, herein designated VGAM RNA, also designated SEQ ID:4114.

[49119] Another function of VGAM1403 is therefore inhibition of Solute Carrier Family 1 (neutral amino acid transporter), Member 5 (SLC1A5, Accession NM_005628). Accordingly, utilities of VGAM1403 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC1A5. FLJ20033 (Accession NM_017629) is another VGAM1403 host target gene. FLJ20033 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20033, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20033 BINDING SITE, designated SEQ ID:19126, to the nucleotide sequence of VGAM1403 RNA, herein designated VGAM RNA, also designated SEQ ID:4114.

[49120] Another function of VGAM1403 is therefore inhibition of FLJ20033 (Accession NM_017629). Accordingly, utilities of VGAM1403 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ20033. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1404 (VGAM1404) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49121] VGAM1404 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1404 was detected is described hereinabove with reference to Figs. 1–8.

[49122] VGAM1404 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Perina Nuda Picorna-like Virus. VGAM1404 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49123] VGAM1404 gene encodes a VGAM1404 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1404 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1404 precursor RNA is desig-

nated SEQ ID:1390, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1390 is located at position 8964 relative to the genome of Perina Nuda Picorna-like Virus.

- [49124] VGAM1404 precursor RNA folds onto itself, forming VGAM1404 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [49125] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1404 folded precursor RNA into VGAM1404 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 62%) nucleotide sequence of VGAM1404 RNA is designated SEQ ID:4115, and is provided hereinbelow with reference to the sequence

listing part.

[49126] VGAM1404 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1404 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1404 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[49127] VGAM1404 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1404 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1404 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1404 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM1404 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[49128] The complementary binding of VGAM1404 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1404 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1404 host target RNA into VGAM1404 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49129] It is appreciated that VGAM1404 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1404 host target genes. The mRNA of each one of this plurality of VGAM1404 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1404 RNA, herein designated VGAM

RNA, and which when bound by VGAM1404 RNA causes inhibition of translation of respective one or more VGAM1404 host target proteins.

[49130] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1404 gene, herein designated VGAM GENE, on one or more VGAM1404 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[49131] It is yet further appreciated that a function of VGAM1404 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1404 include diagnosis, prevention and treatment of viral infection by Perina Nuda Picorna-like Virus. Specific functions, and accordingly utilities, of VGAM1404 correlate with, and may be deduced from, the identity of the host target genes which VGAM1404 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49132] Nucleotide sequences of the VGAM1404 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1404 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1404 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1404 are further described hereinbelow with reference to Table 1.

[49133] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1404 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1404 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49134] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1404 gene, herein designated VGAM is

inhibition of expression of VGAM1404 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1404 correlate with, and may be deduced from, the identity of the target genes which VGAM1404 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[49135] Apical Protein-like (*Xenopus laevis*) (APXL, Accession NM_001649) is a VGAM1404 host target gene. APXL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by APXL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APXL BINDING SITE, designated SEQ ID:7355, to the nucleotide sequence of VGAM1404 RNA, herein designated VGAM RNA, also designated SEQ ID:4115.

[49136] A function of VGAM1404 is therefore inhibition of Apical Protein-like (*Xenopus laevis*) (APXL, Accession NM_001649), a gene which is implicated in amiloride-sensitive sodium channel activity. Accordingly, utilities of VGAM1404 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APXL. The function of APXL and its association with various dis-

eases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM152. KIAA0193 (Accession NM_014766) is another VGAM1404 host target gene. KIAA0193 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0193, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0193 BINDING SITE, designated SEQ ID:16546, to the nucleotide sequence of VGAM1404 RNA, herein designated VGAM RNA, also designated SEQ ID:4115.

[49137] Another function of VGAM1404 is therefore inhibition of KIAA0193 (Accession NM_014766). Accordingly, utilities of VGAM1404 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0193. LOC151414 (Accession XM_087197) is another VGAM1404 host target gene. LOC151414 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151414, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC151414 BINDING SITE, designated SEQ ID:39112, to the nucleotide sequence of VGAM1404 RNA, herein designated VGAM RNA, also designated SEQ ID:4115.

[49138] Another function of VGAM1404 is therefore inhibition of LOC151414 (Accession XM_087197). Accordingly, utilities of VGAM1404 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151414. LOC254532 (Accession XM_172961) is another VGAM1404 host target gene. LOC254532 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254532, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254532 BINDING SITE, designated SEQ ID:46213, to the nucleotide sequence of VGAM1404 RNA, herein designated VGAM RNA, also designated SEQ ID:4115.

[49139] Another function of VGAM1404 is therefore inhibition of LOC254532 (Accession XM_172961). Accordingly, utilities of VGAM1404 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254532. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 1405 (VGAM1405) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49140] VGAM1405 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1405 was detected is described hereinabove with reference to Figs. 1–8.

[49141] VGAM1405 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Perina Nuda Picorna-like Virus. VGAM1405 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49142] VGAM1405 gene encodes a VGAM1405 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1405 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1405 precursor RNA is designated SEQ ID:1391, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1391 is located at position 3355 relative to the

genome of Perina Nuda Picorna-like Virus.

[49143] VGAM1405 precursor RNA folds onto itself, forming VGAM1405 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49144] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1405 folded precursor RNA into VGAM1405 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 51%) nucleotide sequence of VGAM1405 RNA is designated SEQ ID:4116, and is provided hereinbelow with reference to the sequence listing part.

[49145] VGAM1405 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1405 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1405 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[49146] VGAM1405 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1405 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1405 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1405 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1405 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[49147] The complementary binding of VGAM1405 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1405 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1405 host target RNA into VGAM1405 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49148] It is appreciated that VGAM1405 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1405 host target genes. The mRNA of each one of this plurality of VGAM1405 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1405 RNA, herein designated VGAM RNA, and which when bound by VGAM1405 RNA causes inhibition of translation of respective one or more VGAM1405 host target proteins.

[49149] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1405 gene, herein designated VGAM GENE, on one or more VGAM1405 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[49150] It is yet further appreciated that a function of VGAM1405 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1405 include diagnosis, prevention and treatment of viral infection by Perina Nuda Picorna-like Virus. Specific functions, and accordingly utilities, of

VGAM1405 correlate with, and may be deduced from, the identity of the host target genes which VGAM1405 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49151] Nucleotide sequences of the VGAM1405 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1405 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1405 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1405 are further described hereinbelow with reference to Table 1.

[49152] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1405 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1405 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49153] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1405 gene, herein designated VGAM is inhibition of expression of VGAM1405 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1405 correlate with, and may be deduced

from, the identity of the target genes which VGAM1405 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[49154] Frizzled Homolog 10 (Drosophila) (FZD10, Accession NM_007197) is a VGAM1405 host target gene. FZD10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FZD10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FZD10 BINDING SITE, designated SEQ ID:14053, to the nucleotide sequence of VGAM1405 RNA, herein designated VGAM RNA, also designated SEQ ID:4116.

[49155] A function of VGAM1405 is therefore inhibition of Frizzled Homolog 10 (Drosophila) (FZD10, Accession NM_007197). Accordingly, utilities of VGAM1405 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FZD10. Mitogen-activated Protein Kinase 4 (MAPK4, Accession NM_002747) is another VGAM1405 host target gene. MAPK4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAPK4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAPK4 BINDING SITE, designated SEQ ID:8619, to the nucleotide sequence of VGAM1405 RNA, herein designated VGAM RNA, also designated SEQ ID:4116.

[49156] Another function of VGAM1405 is therefore inhibition of Mitogen-activated Protein Kinase 4 (MAPK4, Accession NM_002747), a gene which phosphorylates microtubule-associated protein-2 may promote entry into the cell cycle. Accordingly, utilities of VGAM1405 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPK4. The function of MAPK4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM655. TIA1 Cytotoxic Granule-associated RNA Binding Protein (TIA1, Accession NM_022037) is another VGAM1405 host target gene. TIA1 BINDING SITE1 and TIA1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TIA1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIA1 BINDING SITE1 and

TIA1 BINDING SITE2, designated SEQ ID:22558 and SEQ ID:22733 respectively, to the nucleotide sequence of VGAM1405 RNA, herein designated VGAM RNA, also designated SEQ ID:4116.

[49157] Another function of VGAM1405 is therefore inhibition of TIA1 Cytotoxic Granule-associated RNA Binding Protein (TIA1, Accession NM_022037), a gene which possesses nucleolytic activity against cytotoxic lymphocyte target cells. Accordingly, utilities of VGAM1405 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIA1. The function of TIA1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM276. Zinc Finger Protein 216 (ZNF216, Accession NM_006007) is another VGAM1405 host target gene. ZNF216 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF216, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF216 BINDING SITE, designated SEQ ID:12619, to the nucleotide sequence of VGAM1405 RNA, herein designated VGAM

RNA, also designated SEQ ID:4116.

[49158] Another function of VGAM1405 is therefore inhibition of Zinc Finger Protein 216 (ZNF216, Accession NM_006007). Accordingly, utilities of VGAM1405 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF216. DKFZP566M114 (Accession NM_032128) is another VGAM1405 host target gene. DKFZP566M114 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP566M114, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP566M114 BINDING SITE, designated SEQ ID:25815, to the nucleotide sequence of VGAM1405 RNA, herein designated VGAM RNA, also designated SEQ ID:4116.

[49159] Another function of VGAM1405 is therefore inhibition of DKFZP566M114 (Accession NM_032128). Accordingly, utilities of VGAM1405 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP566M114. EFA6R (Accession NM_015310) is another VGAM1405 host target gene. EFA6R BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by EFA6R, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EFA6R BINDING SITE, designated SEQ ID:17622, to the nucleotide sequence of VGAM1405 RNA, herein designated VGAM RNA, also designated SEQ ID:4116.

[49160] Another function of VGAM1405 is therefore inhibition of EFA6R (Accession NM_015310). Accordingly, utilities of VGAM1405 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EFA6R. FLJ23816 (Accession NM_144655) is another VGAM1405 host target gene. FLJ23816 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ23816, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23816 BINDING SITE, designated SEQ ID:29477, to the nucleotide sequence of VGAM1405 RNA, herein designated VGAM RNA, also designated SEQ ID:4116.

[49161] Another function of VGAM1405 is therefore inhibition of FLJ23816 (Accession NM_144655). Accordingly, utilities of

VGAM1405 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23816. KIAA0478 (Accession NM_014870) is another VGAM1405 host target gene. KIAA0478 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0478, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0478 BINDING SITE, designated SEQ ID:16991, to the nucleotide sequence of VGAM1405 RNA, herein designated VGAM RNA, also designated SEQ ID:4116.

[49162] Another function of VGAM1405 is therefore inhibition of KIAA0478 (Accession NM_014870). Accordingly, utilities of VGAM1405 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0478. KIAA1871 (Accession XM_028409) is another VGAM1405 host target gene. KIAA1871 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1871, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA1871 BINDING SITE, designated SEQ ID:30701, to the nucleotide sequence of VGAM1405 RNA, herein designated VGAM RNA, also designated SEQ ID:4116.

[49163] Another function of VGAM1405 is therefore inhibition of KIAA1871 (Accession XM_028409). Accordingly, utilities of VGAM1405 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1871. MGC22014 (Accession XM_035307) is another VGAM1405 host target gene. MGC22014 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC22014, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC22014 BINDING SITE, designated SEQ ID:32214, to the nucleotide sequence of VGAM1405 RNA, herein designated VGAM RNA, also designated SEQ ID:4116.

[49164] Another function of VGAM1405 is therefore inhibition of MGC22014 (Accession XM_035307). Accordingly, utilities of VGAM1405 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC22014. Protein Kinase, Lysine Deficient 2 (PRKWNK2, Accession XM_117531) is another VGAM1405 host target

gene. PRKWNK2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRKWNK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRKWNK2 BINDING SITE, designated SEQ ID:43516, to the nucleotide sequence of VGAM1405 RNA, herein designated VGAM RNA, also designated SEQ ID:4116.

[49165] Another function of VGAM1405 is therefore inhibition of Protein Kinase, Lysine Deficient 2 (PRKWNK2, Accession XM_117531). Accordingly, utilities of VGAM1405 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKWNK2. Sprouty Homolog 2 (Drosophila) (SPRY2, Accession NM_005842) is another VGAM1405 host target gene. SPRY2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SPRY2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPRY2 BINDING SITE, designated SEQ ID:12455, to the nucleotide sequence of VGAM1405 RNA, herein designated VGAM RNA,

also designated SEQ ID:4116.

[49166] Another function of VGAM1405 is therefore inhibition of Sprouty Homolog 2 (Drosophila) (SPRY2, Accession NM_005842). Accordingly, utilities of VGAM1405 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPRY2. LOC122786 (Accession XM_058660) is another VGAM1405 host target gene. LOC122786 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC122786, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC122786 BINDING SITE, designated SEQ ID:36701, to the nucleotide sequence of VGAM1405 RNA, herein designated VGAM RNA, also designated SEQ ID:4116.

[49167] Another function of VGAM1405 is therefore inhibition of LOC122786 (Accession XM_058660). Accordingly, utilities of VGAM1405 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC122786. LOC203275 (Accession XM_114667) is another VGAM1405 host target gene. LOC203275 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC203275, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203275 BINDING SITE, designated SEQ ID:43026, to the nucleotide sequence of VGAM1405 RNA, herein designated VGAM RNA, also designated SEQ ID:4116.

[49168] Another function of VGAM1405 is therefore inhibition of LOC203275 (Accession XM_114667). Accordingly, utilities of VGAM1405 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203275. LOC257319 (Accession XM_171049) is another VGAM1405 host target gene. LOC257319 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257319, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257319 BINDING SITE, designated SEQ ID:45828, to the nucleotide sequence of VGAM1405 RNA, herein designated VGAM RNA, also designated SEQ ID:4116.

[49169] Another function of VGAM1405 is therefore inhibition of LOC257319 (Accession XM_171049). Accordingly, utilities

of VGAM1405 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257319. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1406 (VGAM1406) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49170] VGAM1406 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1406 was detected is described hereinabove with reference to Figs. 1-8.

[49171] VGAM1406 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Perina Nuda Picorna-like Virus. VGAM1406 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49172] VGAM1406 gene encodes a VGAM1406 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1406 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM1406 precursor RNA is designated SEQ ID:1392, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1392 is located at position 6999 relative to the genome of Perina Nuda Picorna-like Virus.

- [49173] VGAM1406 precursor RNA folds onto itself, forming VGAM1406 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [49174] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1406 folded precursor RNA into VGAM1406 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1406 RNA is designated SEQ ID:4117, and

is provided hereinbelow with reference to the sequence listing part.

[49175] VGAM1406 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1406 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1406 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[49176] VGAM1406 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1406 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1406 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM1406 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1406 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[49177] The complementary binding of VGAM1406 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1406 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1406 host target RNA into VGAM1406 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49178] It is appreciated that VGAM1406 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1406 host target genes. The mRNA of each one of this plurality of VGAM1406 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM1406 RNA, herein designated VGAM RNA, and which when bound by VGAM1406 RNA causes inhibition of translation of respective one or more VGAM1406 host target proteins.

[49179] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1406 gene, herein designated VGAM GENE, on one or more VGAM1406 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[49180] It is yet further appreciated that a function of VGAM1406 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1406 include diagnosis, prevention and treatment of viral infection by Perina Nuda Picorna-like Virus. Specific functions, and accordingly utilities, of VGAM1406 correlate with, and may be deduced from, the identity of the host target genes which VGAM1406 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49181] Nucleotide sequences of the VGAM1406 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1406 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1406 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1406 are further described hereinbelow with reference to Table 1.

[49182] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1406 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1406 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49183] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM1406 gene, herein designated VGAM is inhibition of expression of VGAM1406 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1406 correlate with, and may be deduced from, the identity of the target genes which VGAM1406 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[49184] DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 3 (DDX3, Accession NM_001356) is a VGAM1406 host target gene. DDX3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DDX3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDX3 BINDING SITE, designated SEQ ID:7032, to the nucleotide sequence of VGAM1406 RNA, herein designated VGAM RNA, also designated SEQ ID:4117.

[49185] A function of VGAM1406 is therefore inhibition of DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 3 (DDX3, Accession NM_001356), a gene which interacts with hepatitis c virus core protein resulting a change in intracellular location. Accordingly, utilities of VGAM1406 include diagnosis, prevention and treatment of diseases and clinical

conditions associated with DDX3. The function of DDX3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM232. ARG99 (Accession NM_031920) is another VGAM1406 host target gene. ARG99 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARG99, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARG99 BINDING SITE, designated SEQ ID:25669, to the nucleotide sequence of VGAM1406 RNA, herein designated VGAM RNA, also designated SEQ ID:4117.

[49186] Another function of VGAM1406 is therefore inhibition of ARG99 (Accession NM_031920). Accordingly, utilities of VGAM1406 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARG99. FLJ23462 (Accession NM_024843) is another VGAM1406 host target gene. FLJ23462 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23462, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23462 BINDING SITE, designated SEQ ID:24260, to the nucleotide sequence of VGAM1406 RNA, herein designated VGAM RNA, also designated SEQ ID:4117.

[49187] Another function of VGAM1406 is therefore inhibition of FLJ23462 (Accession NM_024843). Accordingly, utilities of VGAM1406 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23462. Golgi Autoantigen, Golgin Subfamily A, 1 (GOLGA1, Accession NM_002077) is another VGAM1406 host target gene. GOLGA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GOLGA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GOLGA1 BINDING SITE, designated SEQ ID:7857, to the nucleotide sequence of VGAM1406 RNA, herein designated VGAM RNA, also designated SEQ ID:4117.

[49188] Another function of VGAM1406 is therefore inhibition of Golgi Autoantigen, Golgin Subfamily A, 1 (GOLGA1, Accession NM_002077). Accordingly, utilities of VGAM1406

include diagnosis, prevention and treatment of diseases and clinical conditions associated with GOLGA1. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1407 (VGAM1407) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49189] VGAM1407 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1407 was detected is described hereinabove with reference to Figs. 1–8.

[49190] VGAM1407 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Acute Bee Paralysis Virus. VGAM1407 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49191] VGAM1407 gene encodes a VGAM1407 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1407 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1407 precursor RNA is desig-

nated SEQ ID:1393, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1393 is located at position 7313 relative to the genome of Acute Bee Paralysis Virus.

- [49192] VGAM1407 precursor RNA folds onto itself, forming VGAM1407 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [49193] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1407 folded precursor RNA into VGAM1407 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 68%) nucleotide sequence of VGAM1407 RNA is designated SEQ ID:4118, and is provided hereinbelow with reference to the sequence

listing part.

[49194] VGAM1407 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1407 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1407 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[49195] VGAM1407 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1407 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1407 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1407 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM1407 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[49196] The complementary binding of VGAM1407 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1407 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1407 host target RNA into VGAM1407 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49197] It is appreciated that VGAM1407 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1407 host target genes. The mRNA of each one of this plurality of VGAM1407 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1407 RNA, herein designated VGAM

RNA, and which when bound by VGAM1407 RNA causes inhibition of translation of respective one or more VGAM1407 host target proteins.

[49198] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1407 gene, herein designated VGAM GENE, on one or more VGAM1407 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[49199] It is yet further appreciated that a function of VGAM1407 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1407 include diagnosis, prevention and treatment of viral infection by Acute Bee Paralysis Virus. Specific functions, and accordingly utilities, of VGAM1407 correlate with, and may be deduced from, the identity of the host target genes which VGAM1407 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49200] Nucleotide sequences of the VGAM1407 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1407 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1407 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1407 are further described hereinbelow with reference to Table 1.

[49201] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1407 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1407 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49202] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1407 gene, herein designated VGAM is

inhibition of expression of VGAM1407 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1407 correlate with, and may be deduced from, the identity of the target genes which VGAM1407 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[49203] 24-dehydrocholesterol Reductase (DHCR24, Accession NM_014762) is a VGAM1407 host target gene. DHCR24 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DHCR24, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DHCR24 BINDING SITE, designated SEQ ID:16521, to the nucleotide sequence of VGAM1407 RNA, herein designated VGAM RNA, also designated SEQ ID:4118.

[49204] A function of VGAM1407 is therefore inhibition of 24-dehydrocholesterol Reductase (DHCR24, Accession NM_014762), a gene which catalyzes the reduction of sterol intermediates. Accordingly, utilities of VGAM1407 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DHCR24. The func-

tion of DHCR24 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM235. General Transcription Factor IIH, Polypeptide 1, 62kDa (GTF2H1, Accession NM_005316) is another VGAM1407 host target gene. GTF2H1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GTF2H1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GTF2H1 BINDING SITE, designated SEQ ID:11792, to the nucleotide sequence of VGAM1407 RNA, herein designated VGAM RNA, also designated SEQ ID:4118.

[49205] Another function of VGAM1407 is therefore inhibition of General Transcription Factor IIH, Polypeptide 1, 62kDa (GTF2H1, Accession NM_005316), a gene which is subunit of RNA polymerase II transcription initiation factor IIH; involved in transcription and DNA repair mechanisms. Accordingly, utilities of VGAM1407 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GTF2H1. The function of GTF2H1 has been established by previous studies. Initiation of tran-

scription by RNA polymerase II is a complex process requiring, in addition to the polymerase itself, 7 auxiliary factors. Entry of the polymerase into the transcription cycle is mediated by transcription factor TFIIF (see OMIM Ref. No. 189968) and requires a DNA-protein complex composed of the TATA-binding protein subunit of TFIID (OMIM Ref. No. 313650) in association with the TATA motif and TFIIB (OMIM Ref. No. 189963), the so-called DB complex. The largest subunit of mammalian RNA polymerase II (OMIM Ref. No. 180660) contains a heptapeptide repeat, YSPTSPS in the single-letter amino acid code, occurring 52 times at its C terminus. Because the heptapeptide contains serine, threonine, and tyrosine, it is prone to phosphorylation. As a result, RNA polymerase II occurs in 2 forms in vivo: a highly phosphorylated II(O) form and a nonphosphorylated II(A) form. The nonphosphorylated form of RNA polymerase II is recruited by TFIIF to the DB complex. This complex is then recognized by TFII E (OMIM Ref. No. 189962), TFII H, and TFII J, which enter the transcription cycle in that order, to generate a transcription-competent complex. Phosphorylation of the C-terminal domain of the largest subunit of RNA polymerase II is believed to control the transition from transcription initiation

to elongation. The general transcription factor TFIID contains a kinase activity capable of phosphorylating this domain (Lu et al., 1992). Factors that promote the association of RNA polymerase II with the preinitiation complex stimulate this activity. TFIIE, which is required for the stable association of TFIID with the preinitiation complex, affects the processivity of TFIID kinase. TFIID is a multisubunit factor consisting of at least 5 polypeptides of 92 (OMIM Ref. No. 133510), 62, 43 (OMIM Ref. No. 601748), 40, and 35 (OMIM Ref. No. 601750) kD (Flores et al., 1992). A 52-kD subunit (OMIM Ref. No. 601760) has also been identified as a component of the TFIID 'core,' along with p89, p62, p44, and p34 (Marinoni et al., 1997). Lu et al. (1992) expressed the belief that TFIID is the human counterpart of the yeast general transcription factor b. See also 133530 and Habraken et al. (1996). High levels of gene transcription by RNA polymerase II depend on high rates of transcription initiation and reinitiation. Initiation requires recruitment of the complete transcription machinery to a promoter, a process facilitated by activators and chromatin remodeling factors. Reinitiation is thought to occur through a different pathway. After initiation, a subset of the transcription machinery remains at the pro-

moter, forming a platform for assembly of a second transcription complex. Yudkovsky et al. (2000) described the isolation of a reinitiation intermediate in yeast that includes transcription factors TFIID, TFIIA (see OMIM Ref. No. 600520), TFIIH, TFIIIE, and Mediator. This intermediate can act as a scaffold for formation of a functional reinitiation complex. Formation of this scaffold is dependent on ATP and TFIIH. In yeast, the scaffold is stabilized in the presence of the activator Gal4-VP16, but not Gal4-AH, suggesting a new role for some activators and Mediator in promoting high levels of transcription.

[49206] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[49209] Further studies establishing the function and utilities of GTF2H1 are found in John Hopkins OMIM database record

ID 189972, and in cited publications numbered 4706–769, 11357–77 and 1907 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Chromosome 1 Open Reading Frame 24 (C1orf24, Accession NM_052966) is another VGAM1407 host target gene. C1orf24 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C1orf24, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1orf24 BINDING SITE, designated SEQ ID:27527, to the nucleotide sequence of VGAM1407 RNA, herein designated VGAM RNA, also designated SEQ ID:4118.

[49210] Another function of VGAM1407 is therefore inhibition of Chromosome 1 Open Reading Frame 24 (C1orf24, Accession NM_052966). Accordingly, utilities of VGAM1407 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf24. FLJ10891 (Accession NM_018260) is another VGAM1407 host target gene. FLJ10891 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10891, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10891 BINDING SITE, designated SEQ ID:20226, to the nucleotide sequence of VGAM1407 RNA, herein designated VGAM RNA, also designated SEQ ID:4118.

[49211] Another function of VGAM1407 is therefore inhibition of FLJ10891 (Accession NM_018260). Accordingly, utilities of VGAM1407 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10891. FLJ12666 (Accession NM_024595) is another VGAM1407 host target gene. FLJ12666 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12666, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12666 BINDING SITE, designated SEQ ID:23831, to the nucleotide sequence of VGAM1407 RNA, herein designated VGAM RNA, also designated SEQ ID:4118.

[49212] Another function of VGAM1407 is therefore inhibition of FLJ12666 (Accession NM_024595). Accordingly, utilities of VGAM1407 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ12666. FLJ14011 (Accession NM_022103) is another VGAM1407 host target gene. FLJ14011 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ14011, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14011 BINDING SITE, designated SEQ ID:22649, to the nucleotide sequence of VGAM1407 RNA, herein designated VGAM RNA, also designated SEQ ID:4118.

[49213] Another function of VGAM1407 is therefore inhibition of FLJ14011 (Accession NM_022103). Accordingly, utilities of VGAM1407 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14011. Histidyl-tRNA Synthetase 2 (HARS2, Accession NM_080820) is another VGAM1407 host target gene. HARS2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HARS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HARS2 BINDING SITE, designated SEQ

ID:28077, to the nucleotide sequence of VGAM1407 RNA, herein designated VGAM RNA, also designated SEQ ID:4118.

[49214] Another function of VGAM1407 is therefore inhibition of Histidyl-tRNA Synthetase 2 (HARS2, Accession NM_080820). Accordingly, utilities of VGAM1407 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HARS2. KIAA0426 (Accession NM_014724) is another VGAM1407 host target gene. KIAA0426 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0426, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0426 BINDING SITE, designated SEQ ID:16304, to the nucleotide sequence of VGAM1407 RNA, herein designated VGAM RNA, also designated SEQ ID:4118.

[49215] Another function of VGAM1407 is therefore inhibition of KIAA0426 (Accession NM_014724). Accordingly, utilities of VGAM1407 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0426. KIAA1871 (Accession XM_028409) is another

VGAM1407 host target gene. KIAA1871 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1871, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1871 BINDING SITE, designated SEQ ID:30700, to the nucleotide sequence of VGAM1407 RNA, herein designated VGAM RNA, also designated SEQ ID:4118.

[49216] Another function of VGAM1407 is therefore inhibition of KIAA1871 (Accession XM_028409). Accordingly, utilities of VGAM1407 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1871. LOC147660 (Accession XM_085825) is another VGAM1407 host target gene. LOC147660 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147660, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147660 BINDING SITE, designated SEQ ID:38349, to the nucleotide sequence of VGAM1407 RNA, herein designated VGAM RNA, also designated SEQ ID:4118.

[49217] Another function of VGAM1407 is therefore inhibition of LOC147660 (Accession XM_085825). Accordingly, utilities of VGAM1407 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147660. LOC157657 (Accession XM_088352) is another VGAM1407 host target gene. LOC157657 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC157657, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157657 BINDING SITE, designated SEQ ID:39627, to the nucleotide sequence of VGAM1407 RNA, herein designated VGAM RNA, also designated SEQ ID:4118.

[49218] Another function of VGAM1407 is therefore inhibition of LOC157657 (Accession XM_088352). Accordingly, utilities of VGAM1407 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157657. LOC90333 (Accession XM_030958) is another VGAM1407 host target gene. LOC90333 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90333, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90333 BINDING SITE, designated SEQ ID:31217, to the nucleotide sequence of VGAM1407 RNA, herein designated VGAM RNA, also designated SEQ ID:4118.

[49219] Another function of VGAM1407 is therefore inhibition of LOC90333 (Accession XM_030958). Accordingly, utilities of VGAM1407 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90333. LOC91664 (Accession XM_039908) is another VGAM1407 host target gene. LOC91664 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91664, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91664 BINDING SITE, designated SEQ ID:33212, to the nucleotide sequence of VGAM1407 RNA, herein designated VGAM RNA, also designated SEQ ID:4118.

[49220] Another function of VGAM1407 is therefore inhibition of LOC91664 (Accession XM_039908). Accordingly, utilities of VGAM1407 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC91664. LOC92283 (Accession XM_044049) is another VGAM1407 host target gene. LOC92283 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92283, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92283 BINDING SITE, designated SEQ ID:34090, to the nucleotide sequence of VGAM1407 RNA, herein designated VGAM RNA, also designated SEQ ID:4118.

[49221] Another function of VGAM1407 is therefore inhibition of LOC92283 (Accession XM_044049). Accordingly, utilities of VGAM1407 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92283. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1408 (VGAM1408) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49222] VGAM1408 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1408 was detected is described hereinabove with reference to Figs. 1–8.

[49223] VGAM1408 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Acute Bee Paralysis Virus. VGAM1408 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49224] VGAM1408 gene encodes a VGAM1408 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1408 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1408 precursor RNA is designated SEQ ID:1394, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1394 is located at position 6189 relative to the genome of Acute Bee Paralysis Virus.

[49225] VGAM1408 precursor RNA folds onto itself, forming VGAM1408 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide

sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49226] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1408 folded precursor RNA into VGAM1408 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 54%) nucleotide sequence of VGAM1408 RNA is designated SEQ ID:4119, and is provided hereinbelow with reference to the sequence listing part.

[49227] VGAM1408 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1408 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1408 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[49228] VGAM1408 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1408 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1408 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1408 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1408 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[49229] The complementary binding of VGAM1408 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1408 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1408 host target RNA into VGAM1408 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49230] It is appreciated that VGAM1408 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1408 host target genes. The mRNA of each one of this plurality of VGAM1408 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1408 RNA, herein designated VGAM RNA, and which when bound by VGAM1408 RNA causes inhibition of translation of respective one or more VGAM1408 host target proteins.

[49231] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1408 gene, herein designated VGAM GENE, on one or more VGAM1408 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[49232] It is yet further appreciated that a function of VGAM1408 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1408 include diagnosis, prevention and treatment of viral infection by Acute Bee Paralysis Virus. Specific functions, and accordingly utilities, of VGAM1408 correlate with, and may be deduced from, the identity of the host target genes which VGAM1408 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49233] Nucleotide sequences of the VGAM1408 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1408 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM1408 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1408 are further described hereinbelow with reference to Table 1.

[49234] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1408 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1408 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49235] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1408 gene, herein designated VGAM is inhibition of expression of VGAM1408 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1408 correlate with, and may be deduced from, the identity of the target genes which VGAM1408 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[49236] Ectonucleotide Pyrophosphatase/phosphodiesterase 3 (ENPP3, Accession NM_005021) is a VGAM1408 host target gene. ENPP3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded

by ENPP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ENPP3 BINDING SITE, designated SEQ ID:11461, to the nucleotide sequence of VGAM1408 RNA, herein designated VGAM RNA, also designated SEQ ID:4119.

[49237] A function of VGAM1408 is therefore inhibition of Ectonucleotide Pyrophosphatase/phosphodiesterase 3 (ENPP3, Accession NM_005021). Accordingly, utilities of VGAM1408 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ENPP3. Solute Carrier Family 1 (glutamate/neutral amino acid transporter), Member 4 (SLC1A4, Accession NM_003038) is another VGAM1408 host target gene. SLC1A4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC1A4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC1A4 BINDING SITE, designated SEQ ID:8994, to the nucleotide sequence of VGAM1408 RNA, herein designated VGAM RNA, also designated SEQ ID:4119.

[49238] Another function of VGAM1408 is therefore inhibition of Solute Carrier Family 1 (glutamate/neutral amino acid transporter), Member 4 (SLC1A4, Accession NM_003038), a gene which transports alanine, serine, cysteine, and threonine. exhibits sodium dependence. Accordingly, utilities of VGAM1408 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC1A4. The function of SLC1A4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM859. LOC120856 (Accession XM_058509) is another VGAM1408 host target gene. LOC120856 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC120856, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC120856 BINDING SITE, designated SEQ ID:36636, to the nucleotide sequence of VGAM1408 RNA, herein designated VGAM RNA, also designated SEQ ID:4119.

[49239] Another function of VGAM1408 is therefore inhibition of LOC120856 (Accession XM_058509). Accordingly, utilities

of VGAM1408 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC120856. LOC158263 (Accession XM_088530) is another VGAM1408 host target gene. LOC158263 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158263, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158263 BINDING SITE, designated SEQ ID:39798, to the nucleotide sequence of VGAM1408 RNA, herein designated VGAM RNA, also designated SEQ ID:4119.

[49240] Another function of VGAM1408 is therefore inhibition of LOC158263 (Accession XM_088530). Accordingly, utilities of VGAM1408 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158263. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1409 (VGAM1409) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49241] VGAM1409 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1409 was detected is described hereinabove with reference to Figs. 1–8.

[49242] VGAM1409 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Acute Bee Paralysis Virus. VGAM1409 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49243] VGAM1409 gene encodes a VGAM1409 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1409 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1409 precursor RNA is designated SEQ ID:1395, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1395 is located at position 9338 relative to the genome of Acute Bee Paralysis Virus.

[49244] VGAM1409 precursor RNA folds onto itself, forming VGAM1409 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49245] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1409 folded precursor RNA into VGAM1409 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM1409 RNA is designated SEQ ID:4120, and is provided hereinbelow with reference to the sequence listing part.

[49246] VGAM1409 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1409 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1409 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[49247] VGAM1409 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1409 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1409 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1409 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1409 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[49248] The complementary binding of VGAM1409 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1409 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1409 host target RNA into VGAM1409 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49249] It is appreciated that VGAM1409 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1409 host target genes. The mRNA of each one of this plurality of VGAM1409 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1409 RNA, herein designated VGAM RNA, and which when bound by VGAM1409 RNA causes inhibition of translation of respective one or more VGAM1409 host target proteins.

[49250] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1409 gene, herein designated VGAM GENE, on one or more VGAM1409 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[49251] It is yet further appreciated that a function of VGAM1409 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1409 include diagnosis, prevention and treatment of viral infection by Acute Bee Paralysis Virus. Specific functions, and accordingly utilities, of VGAM1409 correlate with, and may be deduced from, the identity of the host target genes which VGAM1409 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49252] Nucleotide sequences of the VGAM1409 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the
`diced` VGAM1409 RNA, herein designated VGAM RNA,
and a schematic representation of the secondary folding
of VGAM1409 folded precursor RNA, herein designated
VGAM FOLDED PRECURSOR RNA, of VGAM1409 are further
described hereinbelow with reference to Table 1.

[49253] Nucleotide sequences of host target binding sites, such as
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of
Fig. 1, found on VGAM1409 host target RNA, and
schematic representation of the complementarity of each
of these host target binding sites to VGAM1409 RNA,
herein designated VGAM RNA, are described hereinbelow
with reference to Table 2.

[49254] As mentioned hereinabove with reference to Fig. 1, a
function of VGAM1409 gene, herein designated VGAM is
inhibition of expression of VGAM1409 target genes. It is
appreciated that specific functions, and accordingly utili-
ties, of VGAM1409 correlate with, and may be deduced
from, the identity of the target genes which VGAM1409
binds and inhibits, and the function of these target genes,
as elaborated hereinbelow.

[49255] FLJ10718 (Accession NM_018192) is a VGAM1409 host
target gene. FLJ10718 BINDING SITE is HOST TARGET

binding site found in the 3` untranslated region of mRNA encoded by FLJ10718, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10718 BINDING SITE, designated SEQ ID:20049, to the nucleotide sequence of VGAM1409 RNA, herein designated VGAM RNA, also designated SEQ ID:4120.

[49256] A function of VGAM1409 is therefore inhibition of FLJ10718 (Accession NM_018192). Accordingly, utilities of VGAM1409 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10718. FLJ14281 (Accession NM_024920) is another VGAM1409 host target gene. FLJ14281 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ14281, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14281 BINDING SITE, designated SEQ ID:24452, to the nucleotide sequence of VGAM1409 RNA, herein designated VGAM RNA, also designated SEQ ID:4120.

[49257] Another function of VGAM1409 is therefore inhibition of

FLJ14281 (Accession NM_024920). Accordingly, utilities of VGAM1409 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14281. FLJ20139 (Accession NM_017685) is another VGAM1409 host target gene. FLJ20139 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20139, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20139 BINDING SITE, designated SEQ ID:19236, to the nucleotide sequence of VGAM1409 RNA, herein designated VGAM RNA, also designated SEQ ID:4120.

[49258] Another function of VGAM1409 is therefore inhibition of FLJ20139 (Accession NM_017685). Accordingly, utilities of VGAM1409 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20139. FLJ31101 (Accession NM_017964) is another VGAM1409 host target gene. FLJ31101 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ31101, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

complementarity of the nucleotide sequences of FLJ31101 BINDING SITE, designated SEQ ID:19685, to the nucleotide sequence of VGAM1409 RNA, herein designated VGAM RNA, also designated SEQ ID:4120.

[49259] Another function of VGAM1409 is therefore inhibition of FLJ31101 (Accession NM_017964). Accordingly, utilities of VGAM1409 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31101. KIAA0964 (Accession NM_014902) is another VGAM1409 host target gene. KIAA0964 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0964, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0964 BINDING SITE, designated SEQ ID:17087, to the nucleotide sequence of VGAM1409 RNA, herein designated VGAM RNA, also designated SEQ ID:4120.

[49260] Another function of VGAM1409 is therefore inhibition of KIAA0964 (Accession NM_014902). Accordingly, utilities of VGAM1409 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0964. Syntaxin 12 (STX12, Accession XM_039018) is

another VGAM1409 host target gene. STX12 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STX12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STX12 BINDING SITE, designated SEQ ID:32982, to the nucleotide sequence of VGAM1409 RNA, herein designated VGAM RNA, also designated SEQ ID:4120.

[49261] Another function of VGAM1409 is therefore inhibition of Syntaxin 12 (STX12, Accession XM_039018). Accordingly, utilities of VGAM1409 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STX12. LOC139231 (Accession XM_060020) is another VGAM1409 host target gene. LOC139231 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC139231, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC139231 BINDING SITE, designated SEQ ID:37142, to the nucleotide sequence of VGAM1409 RNA, herein designated VGAM RNA, also designated SEQ ID:4120.

[49262] Another function of VGAM1409 is therefore inhibition of LOC139231 (Accession XM_060020). Accordingly, utilities of VGAM1409 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC139231. LOC146669 (Accession XM_085534) is another VGAM1409 host target gene. LOC146669 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146669, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146669 BINDING SITE, designated SEQ ID:38226, to the nucleotide sequence of VGAM1409 RNA, herein designated VGAM RNA, also designated SEQ ID:4120.

[49263] Another function of VGAM1409 is therefore inhibition of LOC146669 (Accession XM_085534). Accordingly, utilities of VGAM1409 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146669. LOC149650 (Accession XM_086623) is another VGAM1409 host target gene. LOC149650 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149650, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149650 BINDING SITE, designated SEQ ID:38794, to the nucleotide sequence of VGAM1409 RNA, herein designated VGAM RNA, also designated SEQ ID:4120.

[49264] Another function of VGAM1409 is therefore inhibition of LOC149650 (Accession XM_086623). Accordingly, utilities of VGAM1409 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149650. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1410 (VGAM1410) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49265] VGAM1410 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1410 was detected is described hereinabove with reference to Figs. 1-8.

[49266] VGAM1410 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Acute Bee Paralysis Virus. VGAM1410 host target gene, herein designated

VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49267] VGAM1410 gene encodes a VGAM1410 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1410 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1410 precursor RNA is designated SEQ ID:1396, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1396 is located at position 8237 relative to the genome of Acute Bee Paralysis Virus.

[49268] VGAM1410 precursor RNA folds onto itself, forming VGAM1410 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49269] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1410 folded precursor RNA into VGAM1410

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1410 RNA is designated SEQ ID:4121, and is provided hereinbelow with reference to the sequence listing part.

[49270] VGAM1410 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1410 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1410 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[49271] VGAM1410 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1410 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1410 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1410 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1410 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[49272] The complementary binding of VGAM1410 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1410 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1410 host target RNA into VGAM1410 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[49273] It is appreciated that VGAM1410 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1410 host target genes. The mRNA of each one of this plurality of VGAM1410 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1410 RNA, herein designated VGAM RNA, and which when bound by VGAM1410 RNA causes inhibition of translation of respective one or more VGAM1410 host target proteins.

[49274] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1410 gene, herein designated VGAM GENE, on one or more VGAM1410 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[49275] It is yet further appreciated that a function of VGAM1410 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1410 include diagnosis, prevention and treatment of viral infection by Acute Bee Paralysis Virus. Specific functions, and accordingly utilities, of VGAM1410 correlate with, and may be deduced from, the identity of the host target genes which VGAM1410 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49276] Nucleotide sequences of the VGAM1410 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1410 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1410 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1410 are further described hereinbelow with reference to Table 1.

[49277] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1410 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1410 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49278] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1410 gene, herein designated VGAM is inhibition of expression of VGAM1410 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1410 correlate with, and may be deduced from, the identity of the target genes which VGAM1410 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[49279] B29 (Accession NM_031939) is a VGAM1410 host target gene. B29 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by B29, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of B29 BINDING SITE, designated SEQ ID:25685, to the nucleotide sequence of VGAM1410 RNA, herein designated VGAM RNA, also designated SEQ ID:4121.

[49280] A function of VGAM1410 is therefore inhibition of B29 (Accession NM_031939). Accordingly, utilities of VGAM1410 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B29. Fanconi Anemia, Complementation Group C (FANCC, Accession XM_047190) is another VGAM1410 host target gene. FANCC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FANCC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FANCC BINDING SITE, designated SEQ ID:34907, to the nucleotide sequence of VGAM1410 RNA, herein designated VGAM RNA, also designated SEQ ID:4121.

[49281] Another function of VGAM1410 is therefore inhibition of Fanconi Anemia, Complementation Group C (FANCC, Accession XM_047190). Accordingly, utilities of VGAM1410 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FANCC. Guanine Nucleotide Binding Protein (G protein), Alpha 15 (Gq class) (GNA15, Accession XM_009220) is another VGAM1410 host target gene. GNA15 BINDING SITE is HOST TARGET

binding site found in the 3` untranslated region of mRNA encoded by GNA15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GNA15 BINDING SITE, designated SEQ ID:30104, to the nucleotide sequence of VGAM1410 RNA, herein designated VGAM RNA, also designated SEQ ID:4121.

[49282] Another function of VGAM1410 is therefore inhibition of Guanine Nucleotide Binding Protein (G protein), Alpha 15 (Gq class) (GNA15, Accession XM_009220). Accordingly, utilities of VGAM1410 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNA15. Heparan Sulfate (glucosamine) 3-O-sulfotransferase 4 (HS3ST4, Accession XM_056254) is another VGAM1410 host target gene. HS3ST4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HS3ST4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HS3ST4 BINDING SITE, designated SEQ ID:36371, to the nucleotide sequence of VGAM1410 RNA, herein design-

nated VGAM RNA, also designated SEQ ID:4121.

[49283] Another function of VGAM1410 is therefore inhibition of Heparan Sulfate (glucosamine) 3-O-sulfotransferase 4 (HS3ST4, Accession XM_056254). Accordingly, utilities of VGAM1410 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HS3ST4. Mannosidase, Alpha, Class 2A, Member 1 (MAN2A1, Accession NM_002372) is another VGAM1410 host target gene. MAN2A1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MAN2A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAN2A1 BINDING SITE, designated SEQ ID:8180, to the nucleotide sequence of VGAM1410 RNA, herein designated VGAM RNA, also designated SEQ ID:4121.

[49284] Another function of VGAM1410 is therefore inhibition of Mannosidase, Alpha, Class 2A, Member 1 (MAN2A1, Accession NM_002372), a gene which catalyzes the final hydrolytic step in the asparagine-linked oligosaccharide (N-glycan) maturation pathway. Accordingly, utilities of VGAM1410 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with MAN2A1. The function of MAN2A1 has been established by previous studies. Alpha-mannosidase II catalyzes the first committed step in the biosynthesis of complex N-glycans. Genetic deficiency of this enzyme should abolish complex N-glycan production as reportedly does inhibition of the enzyme by swainsonine. Chui et al. (1997) found that mice in whom the alpha-mannosidase II gene had been disrupted developed a dyserythropoietic anemia concurrent with loss of erythrocyte complex N-glycans. Unexpectedly, nonerythroid cell types continued to produce complex N-glycans by an alternate pathway comprising a distinct alpha-mannosidase. These studies revealed cell type-specific variations in N-linked oligosaccharide biosynthesis and an essential role for alpha-mannosidase II in the formation of erythroid complex N-glycans. Alpha-mannosidase II deficiency elicited a phenotype in mice that corresponds to human congenital dyserythropoietic anemia type II. Although a genetic defect of MAN2A1 was thought to cause congenital dyserythropoietic anemia type II, or HEMPAS (OMIM Ref. No. 224100), Gasparini et al. (1997) excluded it as a candidate gene by demonstrating linkage of the disorder to markers

on chromosome 20. Protein glycosylation in the Golgi apparatus produces structural variation at the cell surface and contributes to immune self-recognition. Altered protein glycosylation and antibodies that recognize endogenous glycans have been associated with various autoimmune syndromes, with the possibility that such abnormalities may reflect genetic defects in glycan formation. Studying mice with a null allele for alpha-mannosidase II, Chui et al. (2001) showed that mutation in this gene, which regulates the hybrid to complex branching pattern of extracellular asparagine (N)-linked oligosaccharide chains (N-glycans), results in a systemic autoimmune disease similar to human systemic lupus erythematosus (OMIM Ref. No. 152700). The findings demonstrated a genetic cause of autoimmune disease provoked by a defect in the pathway of protein N-glycosylation.

[49285] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[49286] Chui, D.; Oh-Eda, M.; Liao, Y.-F.; Panneerselvam, K.; Lai, A.; Marek, K. W.; Freeze, H. H.; Moremen, K. W.; Fukuda, M. N.; Marth, J. D. : Alpha-mannosidase-II deficiency results in dyserythropoiesis and unveils an alternate path-

way in oligosaccharide biosynthesis. Cell 90: 157–167, 1997. ; and

[49287] Chui, D.; Sellakumar, G.; Green, R. S.; Sutton–Smith, M.; McQuistan, T.; Marek, K. W.; Morris, H. R.; Dell, A.; Marth, J. D. : Genetic remodeling of protein glycosylation in vivo induces.

[49288] Further studies establishing the function and utilities of MAN2A1 are found in John Hopkins OMIM database record ID 154582, and in cited publications numbered 11526–11530 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. N–acetylgalactosaminidase, Alpha– (NAGA, Accession NM_000262) is another VGAM1410 host target gene. NAGA BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NAGA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NAGA BINDING SITE, designated SEQ ID:5800, to the nucleotide sequence of VGAM1410 RNA, herein designated VGAM RNA, also designated SEQ ID:4121.

[49289] Another function of VGAM1410 is therefore inhibition of N–acetylgalactosaminidase, Alpha– (NAGA, Accession

NM_000262). Accordingly, utilities of VGAM1410 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NAGA. Procollagen-proline, 2-oxoglutarate 4-dioxygenase (proline 4-hydroxylase), Alpha Polypeptide I (P4HA1, Accession NM_000917) is another VGAM1410 host target gene. P4HA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by P4HA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P4HA1 BINDING SITE, designated SEQ ID:6626, to the nucleotide sequence of VGAM1410 RNA, herein designated VGAM RNA, also designated SEQ ID:4121.

[49290] Another function of VGAM1410 is therefore inhibition of Procollagen-proline, 2-oxoglutarate 4-dioxygenase (proline 4-hydroxylase), Alpha Polypeptide I (P4HA1, Accession NM_000917), a gene which catalyzes the formation of 4-hydroxyproline in collagen. Accordingly, utilities of VGAM1410 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P4HA1. The function of P4HA1 and its association with various diseases and clinical conditions, has been estab-

lished by previous studies, as described hereinabove with reference to VGAM260. Platelet-derived Growth Factor Receptor, Beta Polypeptide (PDGFRB, Accession XM_038350) is another VGAM1410 host target gene. PDGFRB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PDGFRB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDGFRB BINDING SITE, designated SEQ ID:32814, to the nucleotide sequence of VGAM1410 RNA, herein designated VGAM RNA, also designated SEQ ID:4121.

[49291] Another function of VGAM1410 is therefore inhibition of Platelet-derived Growth Factor Receptor, Beta Polypeptide (PDGFRB, Accession XM_038350), a gene which Platelet-derived growth factor receptor beta chain; tyrosine kinase receptor. Accordingly, utilities of VGAM1410 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDGFRB. The function of PDGFRB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM125. Prostaglandin-endoperoxide Synthase 1

(prostaglandin G/H synthase and cyclooxygenase) (PTGS1, Accession NM_080591) is another VGAM1410 host target gene. PTGS1 BINDING SITE1 and PTGS1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PTGS1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTGS1 BINDING SITE1 and PTGS1 BINDING SITE2, designated SEQ ID:27900 and SEQ ID:6679 respectively, to the nucleotide sequence of VGAM1410 RNA, herein designated VGAM RNA, also designated SEQ ID:4121.

[49292] Another function of VGAM1410 is therefore inhibition of Prostaglandin-endoperoxide Synthase 1 (prostaglandin G/H synthase and cyclooxygenase) (PTGS1, Accession NM_080591), a gene which may play an important role in regulating or promoting cell proliferation in some normal and neoplastically transformed cells. Accordingly, utilities of VGAM1410 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTGS1. The function of PTGS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with

reference to VGAM1224. Chromosome 20 Open Reading Frame 20 (C20orf20, Accession NM_018270) is another VGAM1410 host target gene. C20orf20 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf20, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf20 BINDING SITE, designated SEQ ID:20248, to the nucleotide sequence of VGAM1410 RNA, herein designated VGAM RNA, also designated SEQ ID:4121.

[49293] Another function of VGAM1410 is therefore inhibition of Chromosome 20 Open Reading Frame 20 (C20orf20, Accession NM_018270). Accordingly, utilities of VGAM1410 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf20. Chloride Intracellular Channel 2 (CLIC2, Accession NM_001289) is another VGAM1410 host target gene. CLIC2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CLIC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLIC2 BIND-

ING SITE, designated SEQ ID:6968, to the nucleotide sequence of VGAM1410 RNA, herein designated VGAM RNA, also designated SEQ ID:4121.

[49294] Another function of VGAM1410 is therefore inhibition of Chloride Intracellular Channel 2 (CLIC2, Accession NM_001289). Accordingly, utilities of VGAM1410 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLIC2. CTD (carboxy-terminal domain, RNA polymerase II, polypeptide A) Phosphatase, Subunit 1 (CTDP1, Accession NM_004715) is another VGAM1410 host target gene. CTDP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CTDP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CTDP1 BINDING SITE, designated SEQ ID:11073, to the nucleotide sequence of VGAM1410 RNA, herein designated VGAM RNA, also designated SEQ ID:4121.

[49295] Another function of VGAM1410 is therefore inhibition of CTD (carboxy-terminal domain, RNA polymerase II, polypeptide A) Phosphatase, Subunit 1 (CTDP1, Accession

NM_004715). Accordingly, utilities of VGAM1410 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CTDP1. Dynactin 4 (p62) (DCTN4, Accession XM_041993) is another VGAM1410 host target gene. DCTN4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DCTN4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DCTN4 BINDING SITE, designated SEQ ID:33665, to the nucleotide sequence of VGAM1410 RNA, herein designated VGAM RNA, also designated SEQ ID:4121.

[49296] Another function of VGAM1410 is therefore inhibition of Dynactin 4 (p62) (DCTN4, Accession XM_041993). Accordingly, utilities of VGAM1410 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DCTN4. DKFZP586C1619 (Accession XM_030350) is another VGAM1410 host target gene. DKFZP586C1619 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP586C1619, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BIND-

ING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP586C1619 BINDING SITE, designated SEQ ID:31017, to the nucleotide sequence of VGAM1410 RNA, herein designated VGAM RNA, also designated SEQ ID:4121.

[49297] Another function of VGAM1410 is therefore inhibition of DKFZP586C1619 (Accession XM_030350). Accordingly, utilities of VGAM1410 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586C1619. FLJ20574 (Accession NM_017886) is another VGAM1410 host target gene. FLJ20574 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20574, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20574 BINDING SITE, designated SEQ ID:19556, to the nucleotide sequence of VGAM1410 RNA, herein designated VGAM RNA, also designated SEQ ID:4121.

[49298] Another function of VGAM1410 is therefore inhibition of FLJ20574 (Accession NM_017886). Accordingly, utilities of VGAM1410 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ20574. KIAA0121 (Accession XM_052386) is another VGAM1410 host target gene. KIAA0121 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0121, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0121 BINDING SITE, designated SEQ ID:35972, to the nucleotide sequence of VGAM1410 RNA, herein designated VGAM RNA, also designated SEQ ID:4121.

[49299] Another function of VGAM1410 is therefore inhibition of KIAA0121 (Accession XM_052386). Accordingly, utilities of VGAM1410 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0121. KIAA0417 (Accession XM_048898) is another VGAM1410 host target gene. KIAA0417 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0417, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0417 BINDING SITE, designated SEQ ID:35291, to the nucleotide sequence of VGAM1410 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4121.

[49300] Another function of VGAM1410 is therefore inhibition of KIAA0417 (Accession XM_048898). Accordingly, utilities of VGAM1410 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0417. KIAA1538 (Accession XM_049474) is another VGAM1410 host target gene. KIAA1538 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1538, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1538 BINDING SITE, designated SEQ ID:35422, to the nucleotide sequence of VGAM1410 RNA, herein designated VGAM RNA, also designated SEQ ID:4121.

[49301] Another function of VGAM1410 is therefore inhibition of KIAA1538 (Accession XM_049474). Accordingly, utilities of VGAM1410 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1538. KIAA1881 (Accession XM_170901) is another VGAM1410 host target gene. KIAA1881 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1881, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1881 BINDING SITE, designated SEQ ID:45655, to the nucleotide sequence of VGAM1410 RNA, herein designated VGAM RNA, also designated SEQ ID:4121.

[49302] Another function of VGAM1410 is therefore inhibition of KIAA1881 (Accession XM_170901). Accordingly, utilities of VGAM1410 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1881. Myozenin 2 (MYOZ2, Accession NM_016599) is another VGAM1410 host target gene. MYOZ2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MYOZ2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYOZ2 BINDING SITE, designated SEQ ID:18693, to the nucleotide sequence of VGAM1410 RNA, herein designated VGAM RNA, also designated SEQ ID:4121.

[49303] Another function of VGAM1410 is therefore inhibition of Myozenin 2 (MYOZ2, Accession NM_016599). Accordingly, utilities of VGAM1410 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with MYOZ2. NDST4 (Accession NM_022569) is another VGAM1410 host target gene. NDST4 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by NDST4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NDST4 BINDING SITE, designated SEQ ID:22892, to the nucleotide sequence of VGAM1410 RNA, herein designated VGAM RNA, also designated SEQ ID:4121.

[49304] Another function of VGAM1410 is therefore inhibition of NDST4 (Accession NM_022569). Accordingly, utilities of VGAM1410 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NDST4. Neuronal PAS Domain Protein 3 (NPAS3, Accession NM_022123) is another VGAM1410 host target gene. NPAS3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NPAS3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NPAS3 BINDING SITE, designated SEQ

ID:22666, to the nucleotide sequence of VGAM1410 RNA, herein designated VGAM RNA, also designated SEQ ID:4121.

[49305] Another function of VGAM1410 is therefore inhibition of Neuronal PAS Domain Protein 3 (NPAS3, Accession NM_022123). Accordingly, utilities of VGAM1410 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NPAS3. SSB-4 (Accession NM_080862) is another VGAM1410 host target gene. SSB-4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SSB-4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SSB-4 BINDING SITE, designated SEQ ID:28104, to the nucleotide sequence of VGAM1410 RNA, herein designated VGAM RNA, also designated SEQ ID:4121.

[49306] Another function of VGAM1410 is therefore inhibition of SSB-4 (Accession NM_080862). Accordingly, utilities of VGAM1410 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SSB-4. SYNE-1 (Accession NM_015293) is another VGAM1410 host target gene. SYNE-1 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by SYNE-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYNE-1 BINDING SITE, designated SEQ ID:17615, to the nucleotide sequence of VGAM1410 RNA, herein designated VGAM RNA, also designated SEQ ID:4121.

[49307] Another function of VGAM1410 is therefore inhibition of SYNE-1 (Accession NM_015293). Accordingly, utilities of VGAM1410 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYNE-1. Wingless-type MMTV Integration Site Family, Member 10A (WNT10A, Accession NM_025216) is another VGAM1410 host target gene. WNT10A BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by WNT10A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WNT10A BINDING SITE, designated SEQ ID:24896, to the nucleotide sequence of VGAM1410 RNA, herein designated VGAM RNA, also designated SEQ ID:4121.

[49308] Another function of VGAM1410 is therefore inhibition of Wingless-type MMTV Integration Site Family, Member 10A (WNT10A, Accession NM_025216). Accordingly, utilities of VGAM1410 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WNT10A. LOC148753 (Accession XM_097515) is another VGAM1410 host target gene. LOC148753 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148753, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148753 BINDING SITE, designated SEQ ID:40900, to the nucleotide sequence of VGAM1410 RNA, herein designated VGAM RNA, also designated SEQ ID:4121.

[49309] Another function of VGAM1410 is therefore inhibition of LOC148753 (Accession XM_097515). Accordingly, utilities of VGAM1410 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148753. LOC152559 (Accession XM_087487) is another VGAM1410 host target gene. LOC152559 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152559, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152559 BINDING SITE, designated SEQ ID:39283, to the nucleotide sequence of VGAM1410 RNA, herein designated VGAM RNA, also designated SEQ ID:4121.

[49310] Another function of VGAM1410 is therefore inhibition of LOC152559 (Accession XM_087487). Accordingly, utilities of VGAM1410 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152559. LOC155032 (Accession XM_098647) is another VGAM1410 host target gene. LOC155032 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC155032, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155032 BINDING SITE, designated SEQ ID:41748, to the nucleotide sequence of VGAM1410 RNA, herein designated VGAM RNA, also designated SEQ ID:4121.

[49311] Another function of VGAM1410 is therefore inhibition of LOC155032 (Accession XM_098647). Accordingly, utilities of VGAM1410 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC155032. LOC90155 (Accession XM_029487) is another VGAM1410 host target gene. LOC90155 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90155, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90155 BINDING SITE, designated SEQ ID:30900, to the nucleotide sequence of VGAM1410 RNA, herein designated VGAM RNA, also designated SEQ ID:4121.

[49312] Another function of VGAM1410 is therefore inhibition of LOC90155 (Accession XM_029487). Accordingly, utilities of VGAM1410 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90155. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1411 (VGAM1411) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49313] VGAM1411 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1411 was detected is described hereinabove with reference to Figs. 1–8.

[49314] VGAM1411 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Acute Bee Paralysis Virus. VGAM1411 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49315] VGAM1411 gene encodes a VGAM1411 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1411 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1411 precursor RNA is designated SEQ ID:1397, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1397 is located at position 3090 relative to the genome of Acute Bee Paralysis Virus.

[49316] VGAM1411 precursor RNA folds onto itself, forming VGAM1411 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49317] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1411 folded precursor RNA into VGAM1411 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1411 RNA is designated SEQ ID:4122, and is provided hereinbelow with reference to the sequence listing part.

[49318] VGAM1411 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1411 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1411 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[49319] VGAM1411 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1411 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1411 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1411 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1411 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[49320] The complementary binding of VGAM1411 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1411 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1411 host target RNA into VGAM1411 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49321] It is appreciated that VGAM1411 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1411 host target genes. The mRNA of each one of this plurality of VGAM1411 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1411 RNA, herein designated VGAM RNA, and which when bound by VGAM1411 RNA causes inhibition of translation of respective one or more VGAM1411 host target proteins.

[49322] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1411 gene, herein designated VGAM GENE, on one or more VGAM1411 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[49323] It is yet further appreciated that a function of VGAM1411 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1411 include diagnosis, prevention and treatment of viral infection by Acute Bee Paralysis Virus. Specific functions, and accordingly utilities, of VGAM1411 correlate with, and may be deduced from, the identity of the host target genes which VGAM1411 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49324] Nucleotide sequences of the VGAM1411 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM1411 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1411 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1411 are further described hereinbelow with reference to Table 1.

[49325] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1411 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1411 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49326] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1411 gene, herein designated VGAM is inhibition of expression of VGAM1411 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1411 correlate with, and may be deduced from, the identity of the target genes which VGAM1411 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[49327] Poliovirus Receptor (PVR, Accession NM_006505) is a VGAM1411 host target gene. PVR BINDING SITE is HOST TARGET binding site found in the 3` untranslated region

of mRNA encoded by PVR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PVR BINDING SITE, designated SEQ ID:13253, to the nucleotide sequence of VGAM1411 RNA, herein designated VGAM RNA, also designated SEQ ID:4122.

[49328] A function of VGAM1411 is therefore inhibition of Poliovirus Receptor (PVR, Accession NM_006505), a gene which is a poliovirus receptor. Accordingly, utilities of VGAM1411 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PVR. The function of PVR has been established by previous studies. Primates are susceptible to poliomyelitis infection, but rodents are not; furthermore, human cells but not rodent cells are killed by poliovirus in vitro. Susceptibility to poliovirus is a function of the presence or absence of a cellular receptor to which the virus binds as the first step in poliovirus replication. Mendelsohn et al. (1986) succeeded in transforming a human poliovirus receptor gene into mouse L cells which are ordinarily resistant to poliovirus infection because they do not bear a poliovirus receptor. Monoclonal antibody directed against

the HeLa cell poliovirus receptor site was used in rosette assays to identify poliovirus-sensitive transformants. In a study of human-mouse hybrids, Miller et al. (1974) showed that chromosome 19 is correlated with susceptibility to poliovirus. Siddique et al. (1985) regionalized the PVS gene to 19q13-qter. By the study of rodent/human hybrid cell lines carrying 4 different regions of human chromosome 19, Siddique et al. (1988) demonstrated that the typical cytopathic effects of poliovirus infection were observed only when the region 19q12-q13.2 was contained as the smallest region of overlap. The same region contains the gene for myotonic dystrophy (OMIM Ref. No. 160900). The PVS gene is also of interest in connection with inherited motor neuron diseases because it encodes a cell-surface receptor expressed on motor neurons. Shepley et al. (1988) prepared a monoclonal antibody that identified a 100-kD membrane protein in HeLa cells and in human spinal cord involved in poliovirus attachment. They showed that the antigen identified by the monoclonal antibody was associated with the presence of human chromosome 19 in human-mouse hybrid cell lines. The monoclonal antibodies stained neurons in the reticular formation and clusters of brain stem neurons, consis-

tent with the known pattern of damage caused by poliovirus infection in the brain stem. Furthermore, it reacted with human peripheral mononuclear cells, consistent with the known replication of poliovirus in Peyer patches and tonsils. Schonk et al. (1990) assigned the PVS gene to 19q13.2 by hybridization studies using a panel of somatic cell hybrids with subchromosomal segments of 19q. By fluorescence in situ hybridization, Trask et al. (1993) assigned the PVS gene to 19q13.2–q13.3. Seldin et al. (1991) mapped the homologous gene in the mouse to chromosome 9.

[49329] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[49330] Mendelsohn, C.; Johnson, B.; Lionetti, K. A.; Nobis, P.; Wimmer, E.; Racaniello, V. R. : Transformation of a human poliovirus receptor gene into mouse cells. Proc. Nat. Acad. Sci. 83: 7845–7849, 1986. ; and

[49331] Seldin, M. F.; Saunders, A. M.; Rochelle, J. M.; Howard, T. A. : A proximal mouse chromosome 9 linkage map that further defines linkage groups homologous with segments of human chromosom.

[49332] Further studies establishing the function and utilities of

PVR are found in John Hopkins OMIM database record ID 173850, and in cited publications numbered 2745–2751, 3792, 4813–177 and 4710 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. KIAA0635 (Accession NM_014645) is another VGAM1411 host target gene. KIAA0635 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0635, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0635 BINDING SITE, designated SEQ ID:16055, to the nucleotide sequence of VGAM1411 RNA, herein designated VGAM RNA, also designated SEQ ID:4122.

[49333] Another function of VGAM1411 is therefore inhibition of KIAA0635 (Accession NM_014645). Accordingly, utilities of VGAM1411 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0635. KIAA0894 (Accession NM_014896) is another VGAM1411 host target gene. KIAA0894 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0894, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0894 BINDING SITE, designated SEQ ID:17055, to the nucleotide sequence of VGAM1411 RNA, herein designated VGAM RNA, also designated SEQ ID:4122.

[49334] Another function of VGAM1411 is therefore inhibition of KIAA0894 (Accession NM_014896). Accordingly, utilities of VGAM1411 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0894. LOC54505 (Accession XM_042110) is another VGAM1411 host target gene. LOC54505 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC54505, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC54505 BINDING SITE, designated SEQ ID:33694, to the nucleotide sequence of VGAM1411 RNA, herein designated VGAM RNA, also designated SEQ ID:4122.

[49335] Another function of VGAM1411 is therefore inhibition of LOC54505 (Accession XM_042110). Accordingly, utilities of VGAM1411 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC54505. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1412 (VGAM1412) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49336] VGAM1412 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1412 was detected is described hereinabove with reference to Figs. 1–8.

[49337] VGAM1412 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bean Yellow Mosaic Virus. VGAM1412 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49338] VGAM1412 gene encodes a VGAM1412 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1412 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1412 precursor RNA is designated SEQ ID:1398, and is provided hereinbelow with ref–

erence to the sequence listing part. Nucleotide sequence SEQ ID:1398 is located at position 555 relative to the genome of Bean Yellow Mosaic Virus.

[49339] VGAM1412 precursor RNA folds onto itself, forming VGAM1412 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49340] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1412 folded precursor RNA into VGAM1412 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1412 RNA is designated SEQ ID:4123, and is provided hereinbelow with reference to the sequence listing part.

[49341] VGAM1412 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1412 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1412 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[49342] VGAM1412 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1412 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1412 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1412 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM1412 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[49343] The complementary binding of VGAM1412 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1412 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1412 host target RNA into VGAM1412 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49344] It is appreciated that VGAM1412 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1412 host target genes. The mRNA of each one of this plurality of VGAM1412 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1412 RNA, herein designated VGAM RNA, and which when bound by VGAM1412 RNA causes

inhibition of translation of respective one or more VGAM1412 host target proteins.

[49345] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1412 gene, herein designated VGAM GENE, on one or more VGAM1412 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[49346] It is yet further appreciated that a function of VGAM1412 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1412 include diagnosis, prevention and

treatment of viral infection by Bean Yellow Mosaic Virus. Specific functions, and accordingly utilities, of VGAM1412 correlate with, and may be deduced from, the identity of the host target genes which VGAM1412 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49347] Nucleotide sequences of the VGAM1412 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1412 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1412 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1412 are further described hereinbelow with reference to Table 1.

[49348] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1412 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1412 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49349] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1412 gene, herein designated VGAM is inhibition of expression of VGAM1412 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM1412 correlate with, and may be deduced from, the identity of the target genes which VGAM1412 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[49350] Platelet-derived Growth Factor Receptor, Alpha Polypeptide (PDGFRA, Accession NM_006206) is a VGAM1412 host target gene. PDGFRA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PDGFRA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDGFRA BINDING SITE, designated SEQ ID:12880, to the nucleotide sequence of VGAM1412 RNA, herein designated VGAM RNA, also designated SEQ ID:4123.

[49351] A function of VGAM1412 is therefore inhibition of Platelet-derived Growth Factor Receptor, Alpha Polypeptide (PDGFRA, Accession NM_006206), a gene which this receptor binds platelet-derived growth factor and has a tyrosine-protein kinase activity. Accordingly, utilities of VGAM1412 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

PDGFRA. The function of PDGFRA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM117. Serine/threonine Kinase 38 (STK38, Accession NM_007271) is another VGAM1412 host target gene. STK38 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STK38, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STK38 BINDING SITE, designated SEQ ID:14134, to the nucleotide sequence of VGAM1412 RNA, herein designated VGAM RNA, also designated SEQ ID:4123.

[49352] Another function of VGAM1412 is therefore inhibition of Serine/threonine Kinase 38 (STK38, Accession NM_007271). Accordingly, utilities of VGAM1412 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STK38. DKFZp434K2435 (Accession NM_032256) is another VGAM1412 host target gene. DKFZp434K2435 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp434K2435, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434K2435 BINDING SITE, designated SEQ ID:26001, to the nucleotide sequence of VGAM1412 RNA, herein designated VGAM RNA, also designated SEQ ID:4123.

[49353] Another function of VGAM1412 is therefore inhibition of DKFZp434K2435 (Accession NM_032256). Accordingly, utilities of VGAM1412 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434K2435. FLJ20051 (Accession NM_019087) is another VGAM1412 host target gene. FLJ20051 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20051, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20051 BINDING SITE, designated SEQ ID:21162, to the nucleotide sequence of VGAM1412 RNA, herein designated VGAM RNA, also designated SEQ ID:4123.

[49354] Another function of VGAM1412 is therefore inhibition of FLJ20051 (Accession NM_019087). Accordingly, utilities of VGAM1412 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ20051. LOC221687 (Accession XM_166423) is another VGAM1412 host target gene. LOC221687 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221687, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221687 BINDING SITE, designated SEQ ID:44302, to the nucleotide sequence of VGAM1412 RNA, herein designated VGAM RNA, also designated SEQ ID:4123.

[49355] Another function of VGAM1412 is therefore inhibition of LOC221687 (Accession XM_166423). Accordingly, utilities of VGAM1412 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221687. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1413 (VGAM1413) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49356] VGAM1413 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1413 was detected is described hereinabove with reference to Figs. 1–8.

[49357] VGAM1413 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bean Yellow Mosaic Virus. VGAM1413 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49358] VGAM1413 gene encodes a VGAM1413 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1413 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1413 precursor RNA is designated SEQ ID:1399, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1399 is located at position 4084 relative to the genome of Bean Yellow Mosaic Virus.

[49359] VGAM1413 precursor RNA folds onto itself, forming VGAM1413 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49360] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1413 folded precursor RNA into VGAM1413 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM1413 RNA is designated SEQ ID:4124, and is provided hereinbelow with reference to the sequence listing part.

[49361] VGAM1413 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1413 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1413 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[49362] VGAM1413 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1413 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1413 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1413 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1413 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[49363] The complementary binding of VGAM1413 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1413 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1413 host target RNA into VGAM1413 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49364] It is appreciated that VGAM1413 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1413 host target genes. The mRNA of each one of this plurality of VGAM1413 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1413 RNA, herein designated VGAM RNA, and which when bound by VGAM1413 RNA causes inhibition of translation of respective one or more VGAM1413 host target proteins.

[49365] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1413 gene, herein designated VGAM GENE, on one or more VGAM1413 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[49366] It is yet further appreciated that a function of VGAM1413 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1413 include diagnosis, prevention and treatment of viral infection by Bean Yellow Mosaic Virus. Specific functions, and accordingly utilities, of VGAM1413 correlate with, and may be deduced from, the identity of the host target genes which VGAM1413 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49367] Nucleotide sequences of the VGAM1413 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM1413 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1413 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1413 are further described hereinbelow with reference to Table 1.

[49368] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1413 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1413 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49369] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1413 gene, herein designated VGAM is inhibition of expression of VGAM1413 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1413 correlate with, and may be deduced from, the identity of the target genes which VGAM1413 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[49370] Dyskeratosis Congenita 1, Dyskerin (DKC1, Accession NM_001363) is a VGAM1413 host target gene. DKC1 BINDING SITE is HOST TARGET binding site found in the

3` untranslated region of mRNA encoded by DKC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKC1 BINDING SITE, designated SEQ ID:7043, to the nucleotide sequence of VGAM1413 RNA, herein designated VGAM RNA, also designated SEQ ID:4124.

[49371] A function of VGAM1413 is therefore inhibition of Dyskeratosis Congenita 1, Dyskerin (DKC1, Accession NM_001363), a gene which may have cell cycle and nucleolar functions. Accordingly, utilities of VGAM1413 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKC1. The function of DKC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM559. Interleukin 16 (lymphocyte chemoattractant factor) (IL16, Accession NM_004513) is another VGAM1413 host target gene. IL16 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by IL16, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of IL16 BINDING SITE, designated SEQ ID:10839, to the nucleotide sequence of VGAM1413 RNA, herein designated VGAM RNA, also designated SEQ ID:4124.

[49372] Another function of VGAM1413 is therefore inhibition of Interleukin 16 (lymphocyte chemoattractant factor) (IL16, Accession NM_004513), a gene which modulates T-cell activation. Accordingly, utilities of VGAM1413 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL16. The function of IL16 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM819. Cyclin B3 (CCNB3, Accession NM_033671) is another VGAM1413 host target gene. CCNB3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CCNB3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCNB3 BINDING SITE, designated SEQ ID:27396, to the nucleotide sequence of VGAM1413 RNA, herein designated VGAM RNA, also designated SEQ ID:4124.

[49373] Another function of VGAM1413 is therefore inhibition of Cyclin B3 (CCNB3, Accession NM_033671). Accordingly, utilities of VGAM1413 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCNB3. DKFZP586M1120 (Accession NM_031294) is another VGAM1413 host target gene. DKFZP586M1120 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP586M1120, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP586M1120 BINDING SITE, designated SEQ ID:25317, to the nucleotide sequence of VGAM1413 RNA, herein designated VGAM RNA, also designated SEQ ID:4124.

[49374] Another function of VGAM1413 is therefore inhibition of DKFZP586M1120 (Accession NM_031294). Accordingly, utilities of VGAM1413 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586M1120. PB1 (Accession NM_018165) is another VGAM1413 host target gene. PB1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PB1, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PB1 BINDING SITE, designated SEQ ID:19978, to the nucleotide sequence of VGAM1413 RNA, herein designated VGAM RNA, also designated SEQ ID:4124.

[49375] Another function of VGAM1413 is therefore inhibition of PB1 (Accession NM_018165). Accordingly, utilities of VGAM1413 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PB1. Signal Recognition Particle 9kDa (SRP9, Accession XM_086431) is another VGAM1413 host target gene. SRP9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SRP9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SRP9 BINDING SITE, designated SEQ ID:38649, to the nucleotide sequence of VGAM1413 RNA, herein designated VGAM RNA, also designated SEQ ID:4124.

[49376] Another function of VGAM1413 is therefore inhibition of Signal Recognition Particle 9kDa (SRP9, Accession XM_086431). Accordingly, utilities of VGAM1413 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with SRP9. LOC145268 (Accession XM_085072) is another VGAM1413 host target gene. LOC145268 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC145268, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145268 BINDING SITE, designated SEQ ID:37812, to the nucleotide sequence of VGAM1413 RNA, herein designated VGAM RNA, also designated SEQ ID:4124.

[49377] Another function of VGAM1413 is therefore inhibition of LOC145268 (Accession XM_085072). Accordingly, utilities of VGAM1413 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145268. LOC153205 (Accession XM_098322) is another VGAM1413 host target gene. LOC153205 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC153205, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC153205 BINDING SITE, designated SEQ ID:41580, to the nucleotide sequence of VGAM1413 RNA, herein designated VGAM RNA, also designated SEQ ID:4124.

[49378] Another function of VGAM1413 is therefore inhibition of LOC153205 (Accession XM_098322). Accordingly, utilities of VGAM1413 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153205. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1414 (VGAM1414) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49379] VGAM1414 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1414 was detected is described hereinabove with reference to Figs. 1–8.

[49380] VGAM1414 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bean Yellow Mosaic Virus. VGAM1414 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49381] VGAM1414 gene encodes a VGAM1414 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1414 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1414 precursor RNA is designated SEQ ID:1400, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1400 is located at position 1603 relative to the genome of Bean Yellow Mosaic Virus.

[49382] VGAM1414 precursor RNA folds onto itself, forming VGAM1414 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49383] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1414 folded precursor RNA into VGAM1414 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1414 RNA is designated SEQ ID:4125, and is provided hereinbelow with reference to the sequence listing part.

[49384] VGAM1414 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1414 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1414 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[49385] VGAM1414 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1414 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1414 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1414 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1414 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[49386] The complementary binding of VGAM1414 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1414 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1414 host target RNA into VGAM1414 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49387] It is appreciated that VGAM1414 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1414 host target genes. The mRNA of each one of this plurality of VGAM1414 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1414 RNA, herein designated VGAM RNA, and which when bound by VGAM1414 RNA causes inhibition of translation of respective one or more VGAM1414 host target proteins.

[49388] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1414 gene, herein designated VGAM GENE, on one or more VGAM1414 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,
`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[49389] It is yet further appreciated that a function of VGAM1414 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1414 include diagnosis, prevention and treatment of viral infection by Bean Yellow Mosaic Virus. Specific functions, and accordingly utilities, of VGAM1414 correlate with, and may be deduced from, the identity of the host target genes which VGAM1414 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49390] Nucleotide sequences of the VGAM1414 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1414 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1414 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1414 are further described hereinbelow with reference to Table 1.

[49391] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1414 host target RNA, and

schematic representation of the complementarity of each of these host target binding sites to VGAM1414 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49392] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1414 gene, herein designated VGAM is inhibition of expression of VGAM1414 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1414 correlate with, and may be deduced from, the identity of the target genes which VGAM1414 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[49393] ATPase, Na⁺/K⁺ Transporting, Alpha 2 (+) Polypeptide (ATP1A2, Accession NM_000702) is a VGAM1414 host target gene. ATP1A2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP1A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP1A2 BINDING SITE, designated SEQ ID:6366, to the nucleotide sequence of VGAM1414 RNA, herein designated VGAM RNA, also designated SEQ ID:4125.

[49394] A function of VGAM1414 is therefore inhibition of ATPase, Na⁺/K⁺ Transporting, Alpha 2 (+) Polypeptide (ATP1A2, Accession NM_000702). Accordingly, utilities of VGAM1414 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP1A2. Proteoglycan 4, (megakaryocyte stimulating factor, articular superficial zone protein, camptodactyly, arthropathy, coxa vara, pericarditis syndrome) (PRG4, Accession NM_005807) is another VGAM1414 host target gene. PRG4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRG4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRG4 BINDING SITE, designated SEQ ID:12383, to the nucleotide sequence of VGAM1414 RNA, herein designated VGAM RNA, also designated SEQ ID:4125.

[49395] Another function of VGAM1414 is therefore inhibition of Proteoglycan 4, (megakaryocyte stimulating factor, articular superficial zone protein, camptodactyly, arthropathy, coxa vara, pericarditis syndrome) (PRG4, Accession NM_005807). Accordingly, utilities of VGAM1414 include diagnosis, prevention and treatment of diseases and clinical

cal conditions associated with PRG4. TAP Binding Protein (tapasin) (TAPBP, Accession NM_003190) is another VGAM1414 host target gene. TAPBP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TAPBP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TAPBP BINDING SITE, designated SEQ ID:9181, to the nucleotide sequence of VGAM1414 RNA, herein designated VGAM RNA, also designated SEQ ID:4125.

[49396] Another function of VGAM1414 is therefore inhibition of TAP Binding Protein (tapasin) (TAPBP, Accession NM_003190), a gene which is involved in MHC class I-restricted antigen processing. Accordingly, utilities of VGAM1414 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAPBP. The function of TAPBP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM122.CEPT1 (Accession NM_006090) is another VGAM1414 host target gene. CEPT1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region

of mRNA encoded by CEPT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CEPT1 BINDING SITE, designated SEQ ID:12737, to the nucleotide sequence of VGAM1414 RNA, herein designated VGAM RNA, also designated SEQ ID:4125.

[49397] Another function of VGAM1414 is therefore inhibition of CEPT1 (Accession NM_006090). Accordingly, utilities of VGAM1414 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CEPT1. FLJ20086 (Accession NM_017661) is another VGAM1414 host target gene. FLJ20086 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20086, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20086 BINDING SITE, designated SEQ ID:19190, to the nucleotide sequence of VGAM1414 RNA, herein designated VGAM RNA, also designated SEQ ID:4125.

[49398] Another function of VGAM1414 is therefore inhibition of FLJ20086 (Accession NM_017661). Accordingly, utilities of

VGAM1414 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20086. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1415 (VGAM1415) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49399] VGAM1415 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1415 was detected is described hereinabove with reference to Figs. 1–8.

[49400] VGAM1415 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bean Yellow Mosaic Virus. VGAM1415 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49401] VGAM1415 gene encodes a VGAM1415 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1415 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu–

cleotide sequence of VGAM1415 precursor RNA is designated SEQ ID:1401, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1401 is located at position 1048 relative to the genome of Bean Yellow Mosaic Virus.

[49402] VGAM1415 precursor RNA folds onto itself, forming VGAM1415 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49403] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1415 folded precursor RNA into VGAM1415 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 67%) nucleotide sequence of VGAM1415 RNA is designated SEQ ID:4126, and

is provided hereinbelow with reference to the sequence listing part.

[49404] VGAM1415 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1415 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1415 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[49405] VGAM1415 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1415 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1415 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM1415 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1415 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[49406] The complementary binding of VGAM1415 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1415 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1415 host target RNA into VGAM1415 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49407] It is appreciated that VGAM1415 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1415 host target genes. The mRNA of each one of this plurality of VGAM1415 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com–

plementary to VGAM1415 RNA, herein designated VGAM RNA, and which when bound by VGAM1415 RNA causes inhibition of translation of respective one or more VGAM1415 host target proteins.

[49408] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1415 gene, herein designated VGAM GENE, on one or more VGAM1415 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[49409] It is yet further appreciated that a function of VGAM1415 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1415 include diagnosis, prevention and treatment of viral infection by Bean Yellow Mosaic Virus. Specific functions, and accordingly utilities, of VGAM1415 correlate with, and may be deduced from, the identity of the host target genes which VGAM1415 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49410] Nucleotide sequences of the VGAM1415 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1415 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1415 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1415 are further described hereinbelow with reference to Table 1.

[49411] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1415 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1415 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49412] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM1415 gene, herein designated VGAM is inhibition of expression of VGAM1415 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1415 correlate with, and may be deduced from, the identity of the target genes which VGAM1415 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[49413] DEK Oncogene (DNA binding) (DEK, Accession NM_003472) is a VGAM1415 host target gene. DEK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DEK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DEK BINDING SITE, designated SEQ ID:9535, to the nucleotide sequence of VGAM1415 RNA, herein designated VGAM RNA, also designated SEQ ID:4126.

[49414] A function of VGAM1415 is therefore inhibition of DEK Oncogene (DNA binding) (DEK, Accession NM_003472), a gene which interacts in transcriptional regulation and signal transduction. Accordingly, utilities of VGAM1415 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DEK. The function of

DEK and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM795.FLJ31300 (Accession NM_144639) is another VGAM1415 host target gene. FLJ31300 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ31300, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ31300 BINDING SITE, designated SEQ ID:29461, to the nucleotide sequence of VGAM1415 RNA, herein designated VGAM RNA, also designated SEQ ID:4126.

[49415] Another function of VGAM1415 is therefore inhibition of FLJ31300 (Accession NM_144639). Accordingly, utilities of VGAM1415 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31300. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1416 (VGAM1416) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[49416] VGAM1416 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1416 was detected is described hereinabove with reference to Figs. 1–8.

[49417] VGAM1416 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ryegrass Mosaic Virus. VGAM1416 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49418] VGAM1416 gene encodes a VGAM1416 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1416 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1416 precursor RNA is designated SEQ ID:1402, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1402 is located at position 4175 relative to the genome of Ryegrass Mosaic Virus.

[49419] VGAM1416 precursor RNA folds onto itself, forming VGAM1416 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two–

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49420] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1416 folded precursor RNA into VGAM1416 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of VGAM1416 RNA is designated SEQ ID:4127, and is provided hereinbelow with reference to the sequence listing part.

[49421] VGAM1416 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1416 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1416 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[49422] VGAM1416 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1416 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1416 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1416 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1416 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[49423] The complementary binding of VGAM1416 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1416 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1416 host target RNA into VGAM1416 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49424] It is appreciated that VGAM1416 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1416 host target genes. The mRNA of each one of this plurality of VGAM1416 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1416 RNA, herein designated VGAM RNA, and which when bound by VGAM1416 RNA causes inhibition of translation of respective one or more VGAM1416 host target proteins.

[49425] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1416 gene, herein designated VGAM GENE, on one

or more VGAM1416 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[49426] It is yet further appreciated that a function of VGAM1416 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1416 include diagnosis, prevention and treatment of viral infection by Ryegrass Mosaic Virus. Specific functions, and accordingly utilities, of VGAM1416 correlate with, and may be deduced from, the identity of the host target genes which VGAM1416 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49427] Nucleotide sequences of the VGAM1416 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1416 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1416 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1416 are further described hereinbelow with reference to Table 1.

[49428] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1416 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1416 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49429] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1416 gene, herein designated VGAM is inhibition of expression of VGAM1416 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1416 correlate with, and may be deduced from, the identity of the target genes which VGAM1416 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[49430] Dentin Matrix Acidic Phosphoprotein (DMP1, Accession

NM_004407) is a VGAM1416 host target gene. DMP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DMP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DMP1 BINDING SITE, designated SEQ ID:10660, to the nucleotide sequence of VGAM1416 RNA, herein designated VGAM RNA, also designated SEQ ID:4127.

[49431] A function of VGAM1416 is therefore inhibition of Dentin Matrix Acidic Phosphoprotein (DMP1, Accession NM_004407), a gene which regulates mineralization of bone and dentin. Accordingly, utilities of VGAM1416 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DMP1. The function of DMP1 has been established by previous studies. George et al. (1993) isolated a dentin matrix acidic phosphoprotein from a rat odontoblast cDNA library. It is a serine-rich acidic protein that has numerous potential phosphorylation sites, especially for messenger-independent kinases of the casein kinase II group. Expression analysis showed that dmp1 message is essentially dentin-specific. The mouse dmp1 gene was mapped to 5q21, a region of the

mouse genome that shows homology of synteny with human 4q21. Dentinogenesis imperfecta type II (OMIM Ref. No. 125490) maps to that region of the genome, namely 4q13–q21. This prompted Aplin et al. (1995) to isolate a cosmid containing the human DMP1 gene. The isolation of a short tandem repeat polymorphism at this locus allowed them to map DMP1 to 4q21 and demonstrate that it is tightly linked to DGI1 in 2 families. The creation of a YAC contig around the gene for osteopontin (OMIM Ref. No. 166490) allowed them to demonstrate that DMP1 is located within 150 kb of the bone sialoprotein locus (OMIM Ref. No. 147563) and within 490 kb of the SPP1 locus. Mutation search in both SPP1 and IBSP in individuals with dentinogenesis imperfecta yielded negative results. DMP1 is a candidate for similar mutation screen. MacDougall et al. (1996) used fluorescence in situ hybridization to map DMP1 to 4q21. By screening a cDNA library constructed from mandibular and maxillary third molars with the mouse *Dmp1* sequence as the probe, Hirst et al. (1997) isolated a cDNA encoding DMP1. The deduced 513–amino acid, highly acidic, serine–rich protein has a hydrophobic signal peptide, an Arg–Gly–Asp cell–attachment sequence, and numerous potential serine phosphorylation sites. Ge–

omic sequence analysis indicated that the DMP1 gene contains 6 exons, and no disease-specific mutations were identified in 2 families with type II dentinogenesis imperfecta.

[49432] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[49433] Hirst, K. L.; Simmons, D.; Feng, J.; Aplin, H.; Dixon, M. J.; MacDougall, M. : Elucidation of the sequence and the genomic organization of the human dentin matrix acidic phosphoprotein 1 (DMP1) gene: exclusion of the locus from a causative role in the pathogenesis of dentinogenesis imperfecta type II. *Genomics* 42: 38–45, 1997. ; and

[49434] MacDougall, M.; DuPont, B. R.; Simmons, D.; Leach, R. J. : Assignment of DMP1 to human chromosome 4 band q21 by in situ hybridization. *Cytogenet. Cell. Genet.* 74: 189 only, 1996.

[49435] Further studies establishing the function and utilities of DMP1 are found in John Hopkins OMIM database record ID 600980, and in cited publications numbered 12524–7809 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. E74-like Factor 2 (ets domain transcription factor) (ELF2, Accession

NM_006874) is another VGAM1416 host target gene. ELF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ELF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ELF2 BINDING SITE, designated SEQ ID:13742, to the nucleotide sequence of VGAM1416 RNA, herein designated VGAM RNA, also designated SEQ ID:4127.

[49436] Another function of VGAM1416 is therefore inhibition of E74-like Factor 2 (ets domain transcription factor) (ELF2, Accession NM_006874). Accordingly, utilities of VGAM1416 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ELF2. KIAA1586 (Accession XM_166451) is another VGAM1416 host target gene. KIAA1586 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1586, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1586 BINDING SITE, designated SEQ ID:44347, to the nucleotide sequence of VGAM1416 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4127.

[49437] Another function of VGAM1416 is therefore inhibition of KIAA1586 (Accession XM_166451). Accordingly, utilities of VGAM1416 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1586. Mab-21-like 2 (C. elegans) (MAB21L2, Accession NM_006439) is another VGAM1416 host target gene. MAB21L2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MAB21L2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAB21L2 BINDING SITE, designated SEQ ID:13148, to the nucleotide sequence of VGAM1416 RNA, herein designated VGAM RNA, also designated SEQ ID:4127.

[49438] Another function of VGAM1416 is therefore inhibition of Mab-21-like 2 (C. elegans) (MAB21L2, Accession NM_006439). Accordingly, utilities of VGAM1416 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAB21L2. Mitogen-activated Protein Kinase Kinase 6 (MAP2K6, Accession NM_031988) is another VGAM1416 host target gene.

MAP2K6 BINDING SITE1 and MAP2K6 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MAP2K6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP2K6 BINDING SITE1 and MAP2K6 BINDING SITE2, designated SEQ ID:25700 and SEQ ID:8640 respectively, to the nucleotide sequence of VGAM1416 RNA, herein designated VGAM RNA, also designated SEQ ID:4127.

[49439] Another function of VGAM1416 is therefore inhibition of Mitogen-activated Protein Kinase Kinase 6 (MAP2K6, Accession NM_031988). Accordingly, utilities of VGAM1416 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP2K6. KIAA0907 (Accession NM_014949) is another VGAM1417 host target gene. KIAA0907 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0907, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0907 BINDING SITE, designated SEQ ID:17278, to the nucleotide sequence of VGAM1417

RNA, herein designated VGAM RNA, also designated SEQ ID:4128.

[49440] Another function of VGAM1417 is therefore inhibition of KIAA0907 (Accession NM_014949). Accordingly, utilities of VGAM1417 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0907. LOC219722 (Accession XM_167593) is another VGAM1417 host target gene. LOC219722 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC219722, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219722 BINDING SITE, designated SEQ ID:44711, to the nucleotide sequence of VGAM1417 RNA, herein designated VGAM RNA, also designated SEQ ID:4128.

[49441] Another function of VGAM1417 is therefore inhibition of LOC219722 (Accession XM_167593). Accordingly, utilities of VGAM1417 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219722. LOC256113 (Accession XM_172989) is another VGAM1417 host target gene. LOC256113 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC256113, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256113 BINDING SITE, designated SEQ ID:46261, to the nucleotide sequence of VGAM1417 RNA, herein designated VGAM RNA, also designated SEQ ID:4128.

[49442] Another function of VGAM1417 is therefore inhibition of LOC256113 (Accession XM_172989). Accordingly, utilities of VGAM1417 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256113. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1418 (VGAM1418) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49443] VGAM1418 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1418 was detected is described hereinabove with reference to Figs. 1-8.

[49444] VGAM1418 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Ryegrass Mosaic Virus. VGAM1418 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49445] VGAM1418 gene encodes a VGAM1418 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1418 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1418 precursor RNA is designated SEQ ID:1404, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1404 is located at position 3047 relative to the genome of Ryegrass Mosaic Virus.

[49446] VGAM1418 precursor RNA folds onto itself, forming VGAM1418 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49447] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1418 folded precursor RNA into VGAM1418 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1418 RNA is designated SEQ ID:4129, and is provided hereinbelow with reference to the sequence listing part.

[49448] VGAM1418 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1418 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1418 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[49449] VGAM1418 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1418 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1418 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1418 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1418 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[49450] The complementary binding of VGAM1418 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1418 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1418

host target RNA into VGAM1418 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49451] It is appreciated that VGAM1418 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1418 host target genes. The mRNA of each one of this plurality of VGAM1418 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1418 RNA, herein designated VGAM RNA, and which when bound by VGAM1418 RNA causes inhibition of translation of respective one or more VGAM1418 host target proteins.

[49452] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1418 gene, herein designated VGAM GENE, on one or more VGAM1418 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[49453] It is yet further appreciated that a function of VGAM1418 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1418 include diagnosis, prevention and treatment of viral infection by Ryegrass Mosaic Virus. Specific functions, and accordingly utilities, of VGAM1418 correlate with, and may be deduced from, the identity of the host target genes which VGAM1418 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49454] Nucleotide sequences of the VGAM1418 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1418 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1418 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1418 are further

described hereinbelow with reference to Table 1.

[49455] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1418 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1418 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49456] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1418 gene, herein designated VGAM is inhibition of expression of VGAM1418 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1418 correlate with, and may be deduced from, the identity of the target genes which VGAM1418 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[49457] FLJ12409 (Accession NM_025105) is a VGAM1418 host target gene. FLJ12409 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12409, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12409 BINDING SITE,

designated SEQ ID:24751, to the nucleotide sequence of VGAM1418 RNA, herein designated VGAM RNA, also designated SEQ ID:4129.

[49458] A function of VGAM1418 is therefore inhibition of FLJ12409 (Accession NM_025105). Accordingly, utilities of VGAM1418 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12409. LOC115442 (Accession XM_052510) is another VGAM1418 host target gene. LOC115442 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC115442, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115442 BINDING SITE, designated SEQ ID:35981, to the nucleotide sequence of VGAM1418 RNA, herein designated VGAM RNA, also designated SEQ ID:4129.

[49459] Another function of VGAM1418 is therefore inhibition of LOC115442 (Accession XM_052510). Accordingly, utilities of VGAM1418 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115442. LOC196074 (Accession XM_113647) is another VGAM1418 host target gene. LOC196074 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196074, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196074 BINDING SITE, designated SEQ ID:42322, to the nucleotide sequence of VGAM1418 RNA, herein designated VGAM RNA, also designated SEQ ID:4129.

[49460] Another function of VGAM1418 is therefore inhibition of LOC196074 (Accession XM_113647). Accordingly, utilities of VGAM1418 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196074. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1419 (VGAM1419) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49461] VGAM1419 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1419 was detected is described hereinabove with reference to Figs. 1-8.

[49462] VGAM1419 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ryegrass Mosaic Virus. VGAM1419 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49463] VGAM1419 gene encodes a VGAM1419 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1419 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1419 precursor RNA is designated SEQ ID:1405, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1405 is located at position 4295 relative to the genome of Ryegrass Mosaic Virus.

[49464] VGAM1419 precursor RNA folds onto itself, forming VGAM1419 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[49465] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1419 folded precursor RNA into VGAM1419 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM1419 RNA is designated SEQ ID:4130, and is provided hereinbelow with reference to the sequence listing part.

[49466] VGAM1419 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1419 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1419 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[49467] VGAM1419 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1419 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1419 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1419 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1419 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[49468] The complementary binding of VGAM1419 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1419 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1419 host target RNA into VGAM1419 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49469] It is appreciated that VGAM1419 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1419 host target genes. The mRNA of each one of this plurality of VGAM1419 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1419 RNA, herein designated VGAM RNA, and which when bound by VGAM1419 RNA causes inhibition of translation of respective one or more VGAM1419 host target proteins.

[49470] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1419 gene, herein designated VGAM GENE, on one or more VGAM1419 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[49471] It is yet further appreciated that a function of VGAM1419 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1419 include diagnosis, prevention and treatment of viral infection by Ryegrass Mosaic Virus. Specific functions, and accordingly utilities, of VGAM1419 correlate with, and may be deduced from, the identity of the host target genes which VGAM1419 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49472] Nucleotide sequences of the VGAM1419 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1419 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1419 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1419 are further described hereinbelow with reference to Table 1.

[49473] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1419 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1419 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49474] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1419 gene, herein designated VGAM is inhibition of expression of VGAM1419 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1419 correlate with, and may be deduced from, the identity of the target genes which VGAM1419 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[49475] Acidic Repeat Containing (ACRC, Accession NM_052957) is a VGAM1419 host target gene. ACRC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ACRC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of ACRC BINDING SITE, designated SEQ ID:27518, to the nucleotide sequence of VGAM1419 RNA, herein designated VGAM RNA, also designated SEQ ID:4130.

[49476] A function of VGAM1419 is therefore inhibition of Acidic Repeat Containing (ACRC, Accession NM_052957). Accordingly, utilities of VGAM1419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACRC. Caspase 8, Apoptosis-related Cysteine Protease (CASP8, Accession NM_033357) is another VGAM1419 host target gene. CASP8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CASP8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CASP8 BINDING SITE, designated SEQ ID:27207, to the nucleotide sequence of VGAM1419 RNA, herein designated VGAM RNA, also designated SEQ ID:4130.

[49477] Another function of VGAM1419 is therefore inhibition of Caspase 8, Apoptosis-related Cysteine Protease (CASP8, Accession NM_033357), a gene which is an apoptosis-related caspase and an upstream component of Fas receptor

and tumor necrosis factor (TNF) receptor-induced apoptosis. Accordingly, utilities of VGAM1419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CASP8. The function of CASP8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM145. Nuclear Receptor Subfamily 2, Group E, Member 1 (NR2E1, Accession NM_003269) is another VGAM1419 host target gene. NR2E1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NR2E1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NR2E1 BINDING SITE, designated SEQ ID:9281, to the nucleotide sequence of VGAM1419 RNA, herein designated VGAM RNA, also designated SEQ ID:4130.

[49478] Another function of VGAM1419 is therefore inhibition of Nuclear Receptor Subfamily 2, Group E, Member 1 (NR2E1, Accession NM_003269), a gene which may be required for brain development and be involved in the regulation of retinal development . Accordingly, utilities of VGAM1419 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with NR2E1. The function of NR2E1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM689. Vanin 1 (VNN1, Accession NM_004666) is another VGAM1419 host target gene. VNN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by VNN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VNN1 BINDING SITE, designated SEQ ID:11041, to the nucleotide sequence of VGAM1419 RNA, herein designated VGAM RNA, also designated SEQ ID:4130.

[49479] Another function of VGAM1419 is therefore inhibition of Vanin 1 (VNN1, Accession NM_004666), a gene which may regulate steps in thymus homing and play a role in mammalian sexual development. Accordingly, utilities of VGAM1419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VNN1. The function of VNN1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to VGAM419. Chromosome 6 Open Reading Frame 37 (C6orf37, Accession XM_041375) is another VGAM1419 host target gene. C6orf37 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C6orf37, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C6orf37 BINDING SITE, designated SEQ ID:33514, to the nucleotide sequence of VGAM1419 RNA, herein designated VGAM RNA, also designated SEQ ID:4130.

[49480] Another function of VGAM1419 is therefore inhibition of Chromosome 6 Open Reading Frame 37 (C6orf37, Accession XM_041375). Accordingly, utilities of VGAM1419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C6orf37. Chemokine (C-C motif) Receptor 6 (CCR6, Accession NM_004367) is another VGAM1419 host target gene. CCR6 BINDING SITE1 and CCR6 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CCR6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of CCR6 BINDING SITE1 and CCR6 BINDING SITE2, designated SEQ ID:10580 and SEQ ID:25374 respectively, to the nucleotide sequence of VGAM1419 RNA, herein designated VGAM RNA, also designated SEQ ID:4130.

[49481] Another function of VGAM1419 is therefore inhibition of Chemokine (C-C motif) Receptor 6 (CCR6, Accession NM_004367). Accordingly, utilities of VGAM1419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCR6. Olfactory Receptor, Family 2, Subfamily C, Member 3 (OR2C3, Accession XM_060575) is another VGAM1419 host target gene. OR2C3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by OR2C3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OR2C3 BINDING SITE, designated SEQ ID:37177, to the nucleotide sequence of VGAM1419 RNA, herein designated VGAM RNA, also designated SEQ ID:4130.

[49482] Another function of VGAM1419 is therefore inhibition of Olfactory Receptor, Family 2, Subfamily C, Member 3 (OR2C3, Accession XM_060575). Accordingly, utilities of

VGAM1419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OR2C3. RI58 (Accession NM_012420) is another VGAM1419 host target gene. RI58 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RI58, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RI58 BINDING SITE, designated SEQ ID:14798, to the nucleotide sequence of VGAM1419 RNA, herein designated VGAM RNA, also designated SEQ ID:4130.

[49483] Another function of VGAM1419 is therefore inhibition of RI58 (Accession NM_012420). Accordingly, utilities of VGAM1419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RI58. Testis Expressed Sequence 27 (TEX27, Accession NM_021943) is another VGAM1419 host target gene. TEX27 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TEX27, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of TEX27 BINDING SITE, designated SEQ ID:22462, to the nucleotide sequence of VGAM1419 RNA, herein designated VGAM RNA, also designated SEQ ID:4130.

[49484] Another function of VGAM1419 is therefore inhibition of Testis Expressed Sequence 27 (TEX27, Accession NM_021943). Accordingly, utilities of VGAM1419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TEX27. LOC123036 (Accession XM_058676) is another VGAM1419 host target gene. LOC123036 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC123036, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC123036 BINDING SITE, designated SEQ ID:36718, to the nucleotide sequence of VGAM1419 RNA, herein designated VGAM RNA, also designated SEQ ID:4130.

[49485] Another function of VGAM1419 is therefore inhibition of LOC123036 (Accession XM_058676). Accordingly, utilities of VGAM1419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC123036. LOC221773 (Accession XM_165802) is another VGAM1419 host target gene. LOC221773 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221773, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221773 BINDING SITE, designated SEQ ID:43768, to the nucleotide sequence of VGAM1419 RNA, herein designated VGAM RNA, also designated SEQ ID:4130.

[49486] Another function of VGAM1419 is therefore inhibition of LOC221773 (Accession XM_165802). Accordingly, utilities of VGAM1419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221773. LOC253584 (Accession XM_173068) is another VGAM1419 host target gene. LOC253584 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253584, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253584 BINDING SITE, designated SEQ ID:46322, to the nucleotide sequence of VGAM1419 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4130.

[49487] Another function of VGAM1419 is therefore inhibition of LOC253584 (Accession XM_173068). Accordingly, utilities of VGAM1419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253584. LOC253912 (Accession XM_173222) is another VGAM1419 host target gene. LOC253912 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253912, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253912 BINDING SITE, designated SEQ ID:46484, to the nucleotide sequence of VGAM1419 RNA, herein designated VGAM RNA, also designated SEQ ID:4130.

[49488] Another function of VGAM1419 is therefore inhibition of LOC253912 (Accession XM_173222). Accordingly, utilities of VGAM1419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253912. LOC51185 (Accession NM_016302) is another VGAM1419 host target gene. LOC51185 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51185, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51185 BINDING SITE, designated SEQ ID:18425, to the nucleotide sequence of VGAM1419 RNA, herein designated VGAM RNA, also designated SEQ ID:4130.

[49489] Another function of VGAM1419 is therefore inhibition of LOC51185 (Accession NM_016302). Accordingly, utilities of VGAM1419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51185. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1420 (VGAM1420) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49490] VGAM1420 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1420 was detected is described hereinabove with reference to Figs. 1-8.

[49491] VGAM1420 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis GB Virus A.

VGAM1420 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49492] VGAM1420 gene encodes a VGAM1420 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1420 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1420 precursor RNA is designated SEQ ID:1406, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1406 is located at position 4594 relative to the genome of Hepatitis GB Virus A.

[49493] VGAM1420 precursor RNA folds onto itself, forming VGAM1420 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49494] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM1420 folded precursor RNA into VGAM1420 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 90%) nucleotide sequence of VGAM1420 RNA is designated SEQ ID:4131, and is provided hereinbelow with reference to the sequence listing part.

[49495] VGAM1420 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1420 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1420 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[49496] VGAM1420 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1420 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1420 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1420 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1420 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[49497] The complementary binding of VGAM1420 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1420 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1420 host target RNA into VGAM1420 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49498] It is appreciated that VGAM1420 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1420 host target genes. The mRNA of each one of this plurality of VGAM1420 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1420 RNA, herein designated VGAM RNA, and which when bound by VGAM1420 RNA causes inhibition of translation of respective one or more VGAM1420 host target proteins.

[49499] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1420 gene, herein designated VGAM GENE, on one or more VGAM1420 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[49500] It is yet further appreciated that a function of VGAM1420 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1420 include diagnosis, prevention and treatment of viral infection by Hepatitis GB Virus A. Specific functions, and accordingly utilities, of VGAM1420 correlate with, and may be deduced from, the identity of the host target genes which VGAM1420 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49501] Nucleotide sequences of the VGAM1420 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1420 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1420 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1420 are further described hereinbelow with reference to Table 1.

[49502] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1420 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1420 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49503] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1420 gene, herein designated VGAM is inhibition of expression of VGAM1420 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1420 correlate with, and may be deduced from, the identity of the target genes which VGAM1420 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[49504] Caspase 7, Apoptosis-related Cysteine Protease (CASP7, Accession NM_001227) is a VGAM1420 host target gene. CASP7 BINDING SITE1 through CASP7 BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CASP7, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CASP7 BINDING SITE1

through CASP7 BINDING SITE4, designated SEQ ID:6895, SEQ ID:27191, SEQ ID:27192 and SEQ ID:27193 respectively, to the nucleotide sequence of VGAM1420 RNA, herein designated VGAM RNA, also designated SEQ ID:4131.

[49505] A function of VGAM1420 is therefore inhibition of Caspase 7, Apoptosis-related Cysteine Protease (CASP7, Accession NM_001227), a gene which is an apoptosis-related caspase and involves in the activation of executing caspases. Accordingly, utilities of VGAM1420 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CASP7. The function of CASP7 has been established by previous studies. Fernandes-Alnemri et al. (1995) found that active MCH3-alpha protein is made by the cleavage of pro-MCH3-alpha into 2 subunits, p20 and p12. Active CPP32 is similarly made by cleavage of its precursor, pro-CPP32, into 2 subunits. They found that CPP32 could cleave pro-MCH3-alpha into its subunits, but that MCH3-alpha could not cleave pro-CPP32. The authors further demonstrated that MCH4 (OMIM Ref. No. 601762) can cleave pro-MCH3 into its 2 subunits (Fernandes-Alnemri et al., 1996). Expression of MCH3-alpha/CPP32 heterodimers in Sf9 cells induced

apoptosis. They also found that MCH3 cleaves poly(ADP-ribose) polymerase (PARP) with similar kinetics to that of CPP32. Thus Fernandes-Alnemri et al. (1995) concluded that the cleavage of PARP during apoptosis cannot solely be attributed to CPP32 but could also be an activity of its closely related homolog, MCH3-alpha. Riedl et al. (2001) crystallized the C285A variant of human pro-caspase-7 and solved its crystal structure at 2.9 angstrom. Analysis of this executioner zymogen structure and its comparison with the structures of active caspase-7 unveiled the structural basis of the procaspase inactivity and suggested the conformational changes leading to procaspase activation.

[49506] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[49507] Fernandes-Alnemri, T.; Armstrong, R. C.; Krebs, J.; Srinivasula, S. M.; Wang, L.; Bullrich, F.; Fritz, L. C.; Trapani, J. A.; Tomaselli, K. J.; Litwack, G.; Alnemri, E. S. : In vitro activation of CPP32 and Mch3 by Mch4, a novel human apoptotic cysteine protease containing two FADD-like domains. Proc. Nat. Acad. Sci. 93: 7464-7469, 1996. ; and

[49508] Riedl, S. J.; Fuentes-Prior, P.; Renatus, M.; Kairies, N.;

Krapp, S.; Huber, R.; Salvesen, G. S.; Bode, W. : Structural basis for the activation of human procaspase-7. Proc. Nat. Acad. S.

[49509] Further studies establishing the function and utilities of CASP7 are found in John Hopkins OMIM database record ID 601761, and in cited publications numbered 6710, 7119-671 and 7126 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. G Protein-coupled Receptor 81 (GPR81, Accession NM_032554) is another VGAM1420 host target gene. GPR81 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GPR81, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPR81 BINDING SITE, designated SEQ ID:26277, to the nucleotide sequence of VGAM1420 RNA, herein designated VGAM RNA, also designated SEQ ID:4131.

[49510] Another function of VGAM1420 is therefore inhibition of G Protein-coupled Receptor 81 (GPR81, Accession NM_032554). Accordingly, utilities of VGAM1420 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with GPR81. Heat Shock 60kDa Protein 1 (chaperonin) (HSPD1, Accession XM_012182) is another VGAM1420 host target gene. HSPD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSPD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPD1 BINDING SITE, designated SEQ ID:30207, to the nucleotide sequence of VGAM1420 RNA, herein designated VGAM RNA, also designated SEQ ID:4131.

[49511] Another function of VGAM1420 is therefore inhibition of Heat Shock 60kDa Protein 1 (chaperonin) (HSPD1, Accession XM_012182), a gene which is implicated in mitochondrial protein import and macromolecular assembly. may facilitate the correct folding of imported proteins. may also prevent misfolding and promote the refolding and proper assembly of unfolded polypeptides generated under stress conditions in the mitochondrial matrix. Accordingly, utilities of VGAM1420 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPD1. The function of HSPD1 and its association with various diseases and clinical conditions, has

been established by previous studies, as described herein above with reference to VGAM1173. Oxysterol Binding Protein (OSBP, Accession NM_002556) is another VGAM1420 host target gene. OSBP BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by OSBP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OSBP BINDING SITE, designated SEQ ID:8407, to the nucleotide sequence of VGAM1420 RNA, herein designated VGAM RNA, also designated SEQ ID:4131.

[49512] Another function of VGAM1420 is therefore inhibition of Oxysterol Binding Protein (OSBP, Accession NM_002556). Accordingly, utilities of VGAM1420 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBP. Placental Growth Factor, Vascular Endothelial Growth Factor-related Protein (PGF, Accession NM_002632) is another VGAM1420 host target gene. PGF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PGF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Ta-

ble 2 illustrates the complementarity of the nucleotide sequences of PGF BINDING SITE, designated SEQ ID:8491, to the nucleotide sequence of VGAM1420 RNA, herein designated VGAM RNA, also designated SEQ ID:4131.

[49513] Another function of VGAM1420 is therefore inhibition of Placental Growth Factor, Vascular Endothelial Growth Factor-related Protein (PGF, Accession NM_002632), a gene which is a growth factor active in angiogenesis, and endothelial cell growth, stimulating cell proliferation and migration. it binds to receptor vegfr-1/fl. Accordingly, utilities of VGAM1420 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PGF. The function of PGF has been established by previous studies. Angiogenesis is a crucial process during development, certain periods of adult life, and tumorigenesis, and is tightly regulated by a network of growth factors and growth factor receptors. Maglione et al. (1991) isolated a human cDNA encoding a protein related to the vascular permeability factor (VPF; also VEGF; 192240). The protein, symbolized PLGF by them, is 149 amino acids long and shares 53% identity with the platelet-derived growth factor-like region of human VPF. They showed that the N-glycosylated PLGF protein is secreted into the

medium and that it functions as a dimer Animal model experiments lend further support to the function of PGF. Carmeliet et al. (2001) developed Pgf-deficient mice by targeted disruption. Pgf $-/-$ mice were born at expected mendelian ratios and were viable and fertile. Pgf $-/-$ mice had subtle changes of VEGF-dependent retinal and luteal angiogenesis. Pgf $-/-$ mice manifested impaired angiogenesis, plasma extravasation, and collateral growth during ischemia, inflammation, wound healing, and cancer. Transplantation of wildtype bone marrow rescued the impaired angiogenesis and collateral growth in Pgf $-/-$ mice, indicating that PGF might have contributed to vessel growth in the adult by mobilizing bone marrow-derived cells. The synergism between PGF and VEGF was specific, as PGF deficiency impaired the response to VEGF, but not to FGF (OMIM Ref. No. 131220) or histamine. VEGFR1 was activated by PGF, given that anti-VEGFR1 antibodies and a Src-kinase inhibitor blocked the endothelial response to PGF or VEGF/PLGF. By upregulating PGF and the signaling subtype of VEGFR1, endothelial cells amplify their responsiveness to VEGF during the 'angiogenic switch' in many pathologic disorders

[49514] It is appreciated that the abovementioned animal model

for PGF is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[49515] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[49516] Maglione, D.; Guerriero, V.; Viglietto, G.; Delli-Bovi, P.; Persico, M. G. : Isolation of a human placenta cDNA coding for a protein related to the vascular permeability factor. Proc. Nat. Acad. Sci. 88: 9267-9271, 1991. ; and

[49517] Carmeliet, P.; Moons, L.; Luttun, A.; Vincenti, V.; Compernelle, V.; De Mol, M.; Wu, Y.; Bono, F.; Devy, L.; Beck, H.; Scholz, D.; Acker, T.; and 17 others : Synergism between vascular endo.

[49518] Further studies establishing the function and utilities of PGF are found in John Hopkins OMIM database record ID 601121, and in cited publications numbered 6366-6369 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Very Low Density Lipoprotein Receptor (VLDLR, Accession XM_045386) is another VGAM1420 host target gene. VLDLR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by VLDLR, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VLDLR BINDING SITE, designated SEQ ID:34448, to the nucleotide sequence of VGAM1420 RNA, herein designated VGAM RNA, also designated SEQ ID:4131.

[49519] Another function of VGAM1420 is therefore inhibition of Very Low Density Lipoprotein Receptor (VLDLR, Accession XM_045386), a gene which may play a crucial role in triglyceride metabolism. Accordingly, utilities of VGAM1420 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VLDLR. The function of VLDLR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM103. Aminocarboxymuconate Semialdehyde Decarboxylase (acmsd, Accession NM_138326) is another VGAM1420 host target gene. acmsd BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by acmsd, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of acmsd BINDING SITE,

designated SEQ ID:28727, to the nucleotide sequence of VGAM1420 RNA, herein designated VGAM RNA, also designated SEQ ID:4131.

[49520] Another function of VGAM1420 is therefore inhibition of Aminocarboxymuconate Semialdehyde Decarboxylase (acmsd, Accession NM_138326). Accordingly, utilities of VGAM1420 include diagnosis, prevention and treatment of diseases and clinical conditions associated with acmsd. A Disintegrin and Metalloproteinase Domain 9 (meltrin gamma) (ADAM9, Accession NM_003816) is another VGAM1420 host target gene. ADAM9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADAM9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAM9 BINDING SITE, designated SEQ ID:9904, to the nucleotide sequence of VGAM1420 RNA, herein designated VGAM RNA, also designated SEQ ID:4131.

[49521] Another function of VGAM1420 is therefore inhibition of A Disintegrin and Metalloproteinase Domain 9 (meltrin gamma) (ADAM9, Accession NM_003816). Accordingly, utilities of VGAM1420 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with ADAM9. UDP-Gal:betaGal Beta 1,3-galactosyltransferase Polypeptide 6 (B3GALT6, Accession NM_080605) is another VGAM1420 host target gene. B3GALT6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by B3GALT6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of B3GALT6 BINDING SITE, designated SEQ ID:27922, to the nucleotide sequence of VGAM1420 RNA, herein designated VGAM RNA, also designated SEQ ID:4131.

[49522] Another function of VGAM1420 is therefore inhibition of UDP-Gal:betaGal Beta 1,3-galactosyltransferase Polypeptide 6 (B3GALT6, Accession NM_080605). Accordingly, utilities of VGAM1420 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B3GALT6. BC008967 (Accession XM_027309) is another VGAM1420 host target gene. BC008967 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by BC008967, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BC008967 BINDING SITE, designated SEQ ID:30477, to the nucleotide sequence of VGAM1420 RNA, herein designated VGAM RNA, also designated SEQ ID:4131.

[49523] Another function of VGAM1420 is therefore inhibition of BC008967 (Accession XM_027309). Accordingly, utilities of VGAM1420 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BC008967. CL683 (Accession NM_015696) is another VGAM1420 host target gene. CL683 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CL683, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CL683 BINDING SITE, designated SEQ ID:17923, to the nucleotide sequence of VGAM1420 RNA, herein designated VGAM RNA, also designated SEQ ID:4131.

[49524] Another function of VGAM1420 is therefore inhibition of CL683 (Accession NM_015696). Accordingly, utilities of VGAM1420 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CL683.

FLJ14596 (Accession NM_032809) is another VGAM1420 host target gene. FLJ14596 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ14596, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14596 BINDING SITE, designated SEQ ID:26571, to the nucleotide sequence of VGAM1420 RNA, herein designated VGAM RNA, also designated SEQ ID:4131.

[49525] Another function of VGAM1420 is therefore inhibition of FLJ14596 (Accession NM_032809). Accordingly, utilities of VGAM1420 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14596. Glutamic Pyruvate Transaminase (alanine aminotransferase) 2 (GPT2, Accession NM_133443) is another VGAM1420 host target gene. GPT2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GPT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPT2 BINDING SITE, designated SEQ ID:28525, to the nucleotide se-

quence of VGAM1420 RNA, herein designated VGAM RNA, also designated SEQ ID:4131.

[49526] Another function of VGAM1420 is therefore inhibition of Glutamic Pyruvate Transaminase (alanine aminotransferase) 2 (GPT2, Accession NM_133443). Accordingly, utilities of VGAM1420 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPT2. KIAA0020 (Accession NM_014878) is another VGAM1420 host target gene. KIAA0020 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0020, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0020 BINDING SITE, designated SEQ ID:17020, to the nucleotide sequence of VGAM1420 RNA, herein designated VGAM RNA, also designated SEQ ID:4131.

[49527] Another function of VGAM1420 is therefore inhibition of KIAA0020 (Accession NM_014878). Accordingly, utilities of VGAM1420 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0020. KIAA0766 (Accession NM_014805) is another VGAM1420 host target gene. KIAA0766 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0766, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0766 BINDING SITE, designated SEQ ID:16739, to the nucleotide sequence of VGAM1420 RNA, herein designated VGAM RNA, also designated SEQ ID:4131.

[49528] Another function of VGAM1420 is therefore inhibition of KIAA0766 (Accession NM_014805). Accordingly, utilities of VGAM1420 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0766. KIAA0864 (Accession XM_032630) is another VGAM1420 host target gene. KIAA0864 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0864, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0864 BINDING SITE, designated SEQ ID:31685, to the nucleotide sequence of VGAM1420 RNA, herein designated VGAM RNA, also designated SEQ ID:4131.

[49529] Another function of VGAM1420 is therefore inhibition of

KIAA0864 (Accession XM_032630). Accordingly, utilities of VGAM1420 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0864. KIAA1344 (Accession XM_051699) is another VGAM1420 host target gene. KIAA1344 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1344, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1344 BINDING SITE, designated SEQ ID:35871, to the nucleotide sequence of VGAM1420 RNA, herein designated VGAM RNA, also designated SEQ ID:4131.

[49530] Another function of VGAM1420 is therefore inhibition of KIAA1344 (Accession XM_051699). Accordingly, utilities of VGAM1420 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1344. LIM and SH3 Protein 1 (LASP1, Accession NM_006148) is another VGAM1420 host target gene. LASP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LASP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of LASP1 BINDING SITE, designated SEQ ID:12798, to the nucleotide sequence of VGAM1420 RNA, herein designated VGAM RNA, also designated SEQ ID:4131.

[49531] Another function of VGAM1420 is therefore inhibition of LIM and SH3 Protein 1 (LASP1, Accession NM_006148). Accordingly, utilities of VGAM1420 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LASP1. Mitochondrial Ribosomal Protein L35 (MRPL35, Accession NM_016622) is another VGAM1420 host target gene. MRPL35 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MRPL35, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MRPL35 BINDING SITE, designated SEQ ID:18737, to the nucleotide sequence of VGAM1420 RNA, herein designated VGAM RNA, also designated SEQ ID:4131.

[49532] Another function of VGAM1420 is therefore inhibition of Mitochondrial Ribosomal Protein L35 (MRPL35, Accession NM_016622). Accordingly, utilities of VGAM1420 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPL35. PURG (Accession NM_013357) is another VGAM1420 host target gene.

PURG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PURG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PURG BINDING SITE, designated SEQ ID:15006, to the nucleotide sequence of VGAM1420 RNA, herein designated VGAM RNA, also designated SEQ ID:4131.

[49533] Another function of VGAM1420 is therefore inhibition of PURG (Accession NM_013357). Accordingly, utilities of VGAM1420 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PURG. Rho-related BTB Domain Containing 1 (RHOBTB1, Accession XM_166144) is another VGAM1420 host target gene. RHOBTB1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RHOBTB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RHOBTB1 BINDING SITE, designated SEQ

ID:43949, to the nucleotide sequence of VGAM1420 RNA, herein designated VGAM RNA, also designated SEQ ID:4131.

[49534] Another function of VGAM1420 is therefore inhibition of Rho-related BTB Domain Containing 1 (RHOBTB1, Accession XM_166144). Accordingly, utilities of VGAM1420 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RHOBTB1. Vacuolar Protein Sorting 4B (yeast) (VPS4B, Accession NM_004869) is another VGAM1420 host target gene. VPS4B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by VPS4B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VPS4B BINDING SITE, designated SEQ ID:11292, to the nucleotide sequence of VGAM1420 RNA, herein designated VGAM RNA, also designated SEQ ID:4131.

[49535] Another function of VGAM1420 is therefore inhibition of Vacuolar Protein Sorting 4B (yeast) (VPS4B, Accession NM_004869). Accordingly, utilities of VGAM1420 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VPS4B. LOC150397

(Accession XM_086907) is another VGAM1420 host target gene. LOC150397 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150397, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150397 BINDING SITE, designated SEQ ID:38956, to the nucleotide sequence of VGAM1420 RNA, herein designated VGAM RNA, also designated SEQ ID:4131.

[49536] Another function of VGAM1420 is therefore inhibition of LOC150397 (Accession XM_086907). Accordingly, utilities of VGAM1420 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150397. LOC199221 (Accession XM_087310) is another VGAM1420 host target gene. LOC199221 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC199221, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199221 BINDING SITE, designated SEQ ID:39164, to the nucleotide sequence of VGAM1420 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4131.

[49537] Another function of VGAM1420 is therefore inhibition of LOC199221 (Accession XM_087310). Accordingly, utilities of VGAM1420 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199221. LOC221688 (Accession XM_168085) is another VGAM1420 host target gene. LOC221688 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221688, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221688 BINDING SITE, designated SEQ ID:44989, to the nucleotide sequence of VGAM1420 RNA, herein designated VGAM RNA, also designated SEQ ID:4131.

[49538] Another function of VGAM1420 is therefore inhibition of LOC221688 (Accession XM_168085). Accordingly, utilities of VGAM1420 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221688. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1421 (VGAM1421) viral gene, which

modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49539] VGAM1421 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1421 was detected is described hereinabove with reference to Figs. 1–8.

[49540] VGAM1421 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis GB Virus A. VGAM1421 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49541] VGAM1421 gene encodes a VGAM1421 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1421 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1421 precursor RNA is designated SEQ ID:1407, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1407 is located at position 2844 relative to the genome of Hepatitis GB Virus A.

[49542] VGAM1421 precursor RNA folds onto itself, forming

VGAM1421 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49543] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1421 folded precursor RNA into VGAM1421 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1421 RNA is designated SEQ ID:4132, and is provided hereinbelow with reference to the sequence listing part.

[49544] VGAM1421 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1421 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1421 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[49545] VGAM1421 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1421 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1421 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1421 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1421 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[49546] The complementary binding of VGAM1421 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1421 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1421 host target RNA into VGAM1421 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49547] It is appreciated that VGAM1421 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1421 host target genes. The mRNA of each one of this plurality of VGAM1421 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1421 RNA, herein designated VGAM RNA, and which when bound by VGAM1421 RNA causes inhibition of translation of respective one or more VGAM1421 host target proteins.

[49548] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1421 gene, herein designated VGAM GENE, on one or more VGAM1421 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[49549] It is yet further appreciated that a function of VGAM1421 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1421 include diagnosis, prevention and treatment of viral infection by Hepatitis GB Virus A. Specific functions, and accordingly utilities, of VGAM1421 correlate with, and may be deduced from, the identity of the host target genes which VGAM1421 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[49550] Nucleotide sequences of the VGAM1421 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1421 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1421 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1421 are further described hereinbelow with reference to Table 1.

[49551] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1421 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1421 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49552] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1421 gene, herein designated VGAM is inhibition of expression of VGAM1421 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1421 correlate with, and may be deduced from, the identity of the target genes which VGAM1421 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[49553] CD28 Antigen (Tp44) (CD28, Accession NM_006139) is a VGAM1421 host target gene. CD28 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CD28, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CD28 BINDING SITE, designated SEQ ID:12781, to the nucleotide sequence of VGAM1421 RNA, herein designated VGAM RNA, also designated SEQ ID:4132.

[49554] A function of VGAM1421 is therefore inhibition of CD28 Antigen (Tp44) (CD28, Accession NM_006139), a gene which possibly involved in t-cell activation. Accordingly, utilities of VGAM1421 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD28. The function of CD28 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM281. Desmoglein 1 (DSG1, Accession NM_001942) is another VGAM1421 host target gene. DSG1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DSG1,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DSG1 BINDING SITE, designated SEQ ID:7656, to the nucleotide sequence of VGAM1421 RNA, herein designated VGAM RNA, also designated SEQ ID:4132.

[49555] Another function of VGAM1421 is therefore inhibition of Desmoglein 1 (DSG1, Accession NM_001942). Accordingly, utilities of VGAM1421 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DSG1. Heterogeneous Nuclear Ribonucleoprotein A1 (HNRPA1, Accession NM_031157) is another VGAM1421 host target gene. HNRPA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HNRPA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HNRPA1 BINDING SITE, designated SEQ ID:25247, to the nucleotide sequence of VGAM1421 RNA, herein designated VGAM RNA, also designated SEQ ID:4132.

[49556] Another function of VGAM1421 is therefore inhibition of Heterogeneous Nuclear Ribonucleoprotein A1 (HNRPA1,

Accession NM_031157), a gene which involves in the packaging of pre-mrna into hnnp particles, transportes mRNA from the nucleus to the cytoplasm. Accordingly, utilities of VGAM1421 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HNRPA1. The function of HNRPA1 has been established by previous studies. See 164020. In eukaryotic cells, nascent RNA polymerase II transcripts are associated in the nucleus with specific proteins to form ribonucleo-protein complexes called HNRP or 40S. Protein moiety of the 40S particle has 6 major components called core proteins, A1/A2, B1/B2, and C1/C2, plus a number of other proteins. Buoli et al. (1988) isolated and sequenced the cDNA for human HNRPA1. Southern analysis showed that HNRPA1-specific sequences are present in the human genome as a multigene family of about 30 members, most of them corresponding to pseudogenes of the processed type. Biamonti et al. (1989) succeeded in isolating an active HNRPA1 gene which was split into 10 exons and was 4.6 kb long. Michael et al. (1995) reported that HNRPA1 shuttles continuously between the nucleus and cytoplasm and contains a 38-amino acid domain, termed M9, that acts as both a nuclear localization and nuclear export sig-

nal. They suggested that HNRPA1 and other shuttling hn-RNPs function as carriers for RNA during export to the cytoplasm.

[49557] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[49558] Biamonti, G.; Buvoli, M.; Bassi, M. T.; Morandi, C.; Cobianchi, F.; Riva, S. : Isolation of an active gene encoding human hnRNP protein A1: evidence for alternative splicing. *J. Molec. Biol.* 207: 491–503, 1989. ; and

[49559] Michael, W. M.; Choi, M.; Dreyfuss, G. : A nuclear export signal in hnRNP A1: a signal-mediated, temperature-dependent nuclear protein export pathway. *Cell* 83: 415–422, 1995.

[49560] Further studies establishing the function and utilities of HNRPA1 are found in John Hopkins OMIM database record ID 164017, and in cited publications numbered 1719–172 and 1723 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. V-myc Myelocytomatosis Viral Oncogene Homolog 2 (avian) (MYCL2, Accession NM_005377) is another VGAM1421 host target gene. MYCL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by MYCL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYCL2 BINDING SITE, designated SEQ ID:11856, to the nucleotide sequence of VGAM1421 RNA, herein designated VGAM RNA, also designated SEQ ID:4132.

[49561] Another function of VGAM1421 is therefore inhibition of V-myc Myelocytomatosis Viral Oncogene Homolog 2 (avian) (MYCL2, Accession NM_005377). Accordingly, utilities of VGAM1421 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYCL2. PCTAIRE Protein Kinase 3 (PCTK3, Accession XM_053746) is another VGAM1421 host target gene. PCTK3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCTK3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCTK3 BINDING SITE, designated SEQ ID:36125, to the nucleotide sequence of VGAM1421 RNA, herein designated VGAM RNA, also designated SEQ ID:4132.

[49562] Another function of VGAM1421 is therefore inhibition of PCTAIRE Protein Kinase 3 (PCTK3, Accession XM_053746), a gene which may play a role in signal transduction cascades in terminally differentiated cells. Accordingly, utilities of VGAM1421 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCTK3. The function of PCTK3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM132. SRGAP2 (Accession XM_059095) is another VGAM1421 host target gene. SRGAP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SRGAP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SRGAP2 BINDING SITE, designated SEQ ID:36880, to the nucleotide sequence of VGAM1421 RNA, herein designated VGAM RNA, also designated SEQ ID:4132.

[49563] Another function of VGAM1421 is therefore inhibition of SRGAP2 (Accession XM_059095). Accordingly, utilities of VGAM1421 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with SR-GAP2. Chromosome 11 Open Reading Frame 9 (C11orf9, Accession NM_013279) is another VGAM1421 host target gene. C11orf9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C11orf9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C11orf9 BINDING SITE, designated SEQ ID:14943, to the nucleotide sequence of VGAM1421 RNA, herein designated VGAM RNA, also designated SEQ ID:4132.

[49564] Another function of VGAM1421 is therefore inhibition of Chromosome 11 Open Reading Frame 9 (C11orf9, Accession NM_013279). Accordingly, utilities of VGAM1421 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C11orf9. Golgi Associated, Gamma Adaptin Ear Containing, ARF Binding Protein 2 (GGA2, Accession NM_138640) is another VGAM1421 host target gene. GGA2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GGA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GGA2 BINDING SITE, designated SEQ ID:28924, to the nucleotide sequence of VGAM1421 RNA, herein designated VGAM RNA, also designated SEQ ID:4132.

[49565] Another function of VGAM1421 is therefore inhibition of Golgi Associated, Gamma Adaptin Ear Containing, ARF Binding Protein 2 (GGA2, Accession NM_138640). Accordingly, utilities of VGAM1421 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GGA2. KIAA1856 (Accession XM_166549) is another VGAM1421 host target gene. KIAA1856 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1856, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1856 BINDING SITE, designated SEQ ID:44524, to the nucleotide sequence of VGAM1421 RNA, herein designated VGAM RNA, also designated SEQ ID:4132.

[49566] Another function of VGAM1421 is therefore inhibition of KIAA1856 (Accession XM_166549). Accordingly, utilities of VGAM1421 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1856. MGC10870 (Accession NM_032301) is another VGAM1421 host target gene. MGC10870 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC10870, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC10870 BINDING SITE, designated SEQ ID:26083, to the nucleotide sequence of VGAM1421 RNA, herein designated VGAM RNA, also designated SEQ ID:4132.

[49567] Another function of VGAM1421 is therefore inhibition of MGC10870 (Accession NM_032301). Accordingly, utilities of VGAM1421 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10870. MGC20460 (Accession NM_053043) is another VGAM1421 host target gene. MGC20460 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC20460, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC20460 BINDING SITE, designated SEQ ID:27589, to

the nucleotide sequence of VGAM1421 RNA, herein designated VGAM RNA, also designated SEQ ID:4132.

[49568] Another function of VGAM1421 is therefore inhibition of MGC20460 (Accession NM_053043). Accordingly, utilities of VGAM1421 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC20460. Torsin Family 1, Member B (torsin B) (TOR1B, Accession NM_014506) is another VGAM1421 host target gene. TOR1B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TOR1B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TOR1B BINDING SITE, designated SEQ ID:15842, to the nucleotide sequence of VGAM1421 RNA, herein designated VGAM RNA, also designated SEQ ID:4132.

[49569] Another function of VGAM1421 is therefore inhibition of Torsin Family 1, Member B (torsin B) (TOR1B, Accession NM_014506). Accordingly, utilities of VGAM1421 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TOR1B. Zinc Finger Protein 17 (HPF3, KOX 10) (ZNF17, Accession XM_091895) is an-

other VGAM1421 host target gene. ZNF17 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF17, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF17 BINDING SITE, designated SEQ ID:40068, to the nucleotide sequence of VGAM1421 RNA, herein designated VGAM RNA, also designated SEQ ID:4132.

[49570] Another function of VGAM1421 is therefore inhibition of Zinc Finger Protein 17 (HPF3, KOX 10) (ZNF17, Accession XM_091895). Accordingly, utilities of VGAM1421 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF17. LOC146237 (Accession XM_096954) is another VGAM1421 host target gene. LOC146237 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146237, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146237 BINDING SITE, designated SEQ ID:40671, to the nucleotide sequence of VGAM1421 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4132.

[49571] Another function of VGAM1421 is therefore inhibition of LOC146237 (Accession XM_096954). Accordingly, utilities of VGAM1421 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146237. LOC146733 (Accession XM_097076) is another VGAM1421 host target gene. LOC146733 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146733, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146733 BINDING SITE, designated SEQ ID:40731, to the nucleotide sequence of VGAM1421 RNA, herein designated VGAM RNA, also designated SEQ ID:4132.

[49572] Another function of VGAM1421 is therefore inhibition of LOC146733 (Accession XM_097076). Accordingly, utilities of VGAM1421 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146733. LOC222183 (Accession XM_168436) is another VGAM1421 host target gene. LOC222183 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC222183, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222183 BINDING SITE, designated SEQ ID:45185, to the nucleotide sequence of VGAM1421 RNA, herein designated VGAM RNA, also designated SEQ ID:4132.

[49573] Another function of VGAM1421 is therefore inhibition of LOC222183 (Accession XM_168436). Accordingly, utilities of VGAM1421 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222183. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1422 (VGAM1422) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49574] VGAM1422 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1422 was detected is described hereinabove with reference to Figs. 1-8.

[49575] VGAM1422 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis GB Virus A.

VGAM1422 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49576] VGAM1422 gene encodes a VGAM1422 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1422 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1422 precursor RNA is designated SEQ ID:1408, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1408 is located at position 1070 relative to the genome of Hepatitis GB Virus A.

[49577] VGAM1422 precursor RNA folds onto itself, forming VGAM1422 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49578] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM1422 folded precursor RNA into VGAM1422 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1422 RNA is designated SEQ ID:4133, and is provided hereinbelow with reference to the sequence listing part.

[49579] VGAM1422 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1422 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1422 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[49580] VGAM1422 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1422 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1422 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1422 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1422 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[49581] The complementary binding of VGAM1422 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1422 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1422 host target RNA into VGAM1422 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49582] It is appreciated that VGAM1422 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1422 host target genes. The mRNA of each one of this plurality of VGAM1422 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1422 RNA, herein designated VGAM RNA, and which when bound by VGAM1422 RNA causes inhibition of translation of respective one or more VGAM1422 host target proteins.

[49583] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1422 gene, herein designated VGAM GENE, on one or more VGAM1422 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[49584] It is yet further appreciated that a function of VGAM1422 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1422 include diagnosis, prevention and treatment of viral infection by Hepatitis GB Virus A. Specific functions, and accordingly utilities, of VGAM1422 correlate with, and may be deduced from, the identity of the host target genes which VGAM1422 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49585] Nucleotide sequences of the VGAM1422 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1422 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1422 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1422 are further described hereinbelow with reference to Table 1.

[49586] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1422 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1422 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49587] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1422 gene, herein designated VGAM is inhibition of expression of VGAM1422 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1422 correlate with, and may be deduced from, the identity of the target genes which VGAM1422 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[49588] CDC-like Kinase 2 (CLK2, Accession NM_001291) is a VGAM1422 host target gene. CLK2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLK2 BINDING SITE, designated SEQ ID:6972, to the nucleotide sequence of

VGAM1422 RNA, herein designated VGAM RNA, also designated SEQ ID:4133.

[49589] A function of VGAM1422 is therefore inhibition of CDC-like Kinase 2 (CLK2, Accession NM_001291), a gene which catalyzes the phosphorylation of proteins. Accordingly, utilities of VGAM1422 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLK2. The function of CLK2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM356. Dynamin 2 (DNM2, Accession NM_004945) is another VGAM1422 host target gene. DNM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DNM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DNM2 BINDING SITE, designated SEQ ID:11388, to the nucleotide sequence of VGAM1422 RNA, herein designated VGAM RNA, also designated SEQ ID:4133.

[49590] Another function of VGAM1422 is therefore inhibition of Dynamin 2 (DNM2, Accession NM_004945), a gene which

regulates budding of endocytic vesicles . Accordingly, utilities of VGAM1422 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNM2. The function of DNM2 has been established by previous studies. Dynamins (DNMs) are members of a group of GTPases that share high homology in their N-terminal regions. Mammals have at least 3 DNMs: DNM1 (OMIM Ref. No. 602377), DNM2, and DNM3. Diatloff-Zito et al. (1995) had previously isolated a human genomic DNA fragment by its capacity to correct the mitomycin C hypersensitivity of cells from a Fanconi anemia patient belonging to genetic complementation group D (FACD; 227646). Using this fragment, they screened a human fibroblast cDNA library and isolated a cDNA encoding DNM2. The predicted 866-amino acid protein is 73% and 98% identical to DNM1 and rat Dnm2, respectively. It contains the 3 consensus sequence elements characteristic of GTP-binding proteins at its N terminus, a Pleckstrin homology domain, and a basic, proline-rich C-terminal region that contains multiple SRC homology 3 domains. DNM2 contains 9 consensus motifs for CDC2 (OMIM Ref. No. 116940) phosphorylation, indicating a potential role at the G2/mitosis transition. Northern blot analysis de-

tected a 3.6-kb transcript in all tissues examined, with highest expression in heart and skeletal muscle. Sequencing and RT-PCR identified alternative splicing variants of DNM2. The authors suggested that multiple rounds of duplication and divergence occurred within DNM gene evolution. No alterations in DNM2 sequence or mRNA expression were detected in the FACD patient studied. By interspecific backcross analysis, Klocke et al. (1997) found that the mouse Dnm2 gene is closely linked to the Icam1 gene (OMIM Ref. No. 147840) on the proximal portion of chromosome 9, in a region with homologies to human 19p, 8q, and 11q.

[49591] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[49592] Diatloff-Zito, C.; Gordon, A. J. E.; Duchaud, E.; Merlin, G. : Isolation of an ubiquitously expressed cDNA encoding human dynamin II, a member of the large GTP-binding protein family. Gene 163: 301-306, 1995. ; and

[49593] Klocke, R.; Augustin, A.; Ronsiek, M.; Stief, A.; van der Putten, H.; Jockusch, H. : Dynamin genes Dnm1 and Dnm2 are located on proximal mouse chromosomes 2 and 9, respectively. Genomic.

[49594] Further studies establishing the function and utilities of DNM2 are found in John Hopkins OMIM database record ID 602378, and in cited publications numbered 5604 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Filamin B, Beta (actin binding protein 278) (FLNB, Accession XM_030806) is another VGAM1422 host target gene. FLNB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLNB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLNB BINDING SITE, designated SEQ ID:31147, to the nucleotide sequence of VGAM1422 RNA, herein designated VGAM RNA, also designated SEQ ID:4133.

[49595] Another function of VGAM1422 is therefore inhibition of Filamin B, Beta (actin binding protein 278) (FLNB, Accession XM_030806), a gene which Filamin B, beta; binds actin, interacts with cytoplasmic domain of Iba1. Accordingly, utilities of VGAM1422 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLNB. The function of FLNB and its association with various diseases and clinical conditions, has

been established by previous studies, as described herein above with reference to VGAM416. Hairless Homolog (mouse) (HR, Accession NM_005144) is another VGAM1422 host target gene. HR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HR BINDING SITE, designated SEQ ID:11619, to the nucleotide sequence of VGAM1422 RNA, herein designated VGAM RNA, also designated SEQ ID:4133.

[49596] Another function of VGAM1422 is therefore inhibition of Hairless Homolog (mouse) (HR, Accession NM_005144). Accordingly, utilities of VGAM1422 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HR. Meningioma (disrupted in balanced translocation) 1 (MN1, Accession NM_002430) is another VGAM1422 host target gene. MN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of MN1 BINDING SITE, designated SEQ ID:8274, to the nucleotide sequence of VGAM1422 RNA, herein designated VGAM RNA, also designated SEQ ID:4133.

[49597] Another function of VGAM1422 is therefore inhibition of Meningioma (disrupted in balanced translocation) 1 (MN1, Accession NM_002430). Accordingly, utilities of VGAM1422 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MN1. Nerve Growth Factor Receptor (TNFR superfamily, member 16) (NGFR, Accession NM_002507) is another VGAM1422 host target gene. NGFR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NGFR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NGFR BINDING SITE, designated SEQ ID:8335, to the nucleotide sequence of VGAM1422 RNA, herein designated VGAM RNA, also designated SEQ ID:4133.

[49598] Another function of VGAM1422 is therefore inhibition of Nerve Growth Factor Receptor (TNFR superfamily, member 16) (NGFR, Accession NM_002507), a gene which can me-

mediate cell survival as well as cell death of neural cells. Accordingly, utilities of VGAM1422 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NGFR. The function of NGFR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM212. Retinoic Acid Induced 2 (RAI2, Accession NM_021785) is another VGAM1422 host target gene. RAI2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by RAI2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAI2 BINDING SITE, designated SEQ ID:22349, to the nucleotide sequence of VGAM1422 RNA, herein designated VGAM RNA, also designated SEQ ID:4133.

[49599] Another function of VGAM1422 is therefore inhibition of Retinoic Acid Induced 2 (RAI2, Accession NM_021785). Accordingly, utilities of VGAM1422 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAI2. Apg4B (Accession NM_013325) is another VGAM1422 host target gene. Apg4B BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by Apg4B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Apg4B BINDING SITE, designated SEQ ID:14975, to the nucleotide sequence of VGAM1422 RNA, herein designated VGAM RNA, also designated SEQ ID:4133.

[49600] Another function of VGAM1422 is therefore inhibition of Apg4B (Accession NM_013325). Accordingly, utilities of VGAM1422 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Apg4B. D15Wsu75e (Accession XM_039495) is another VGAM1422 host target gene. D15Wsu75e BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by D15Wsu75e, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of D15Wsu75e BINDING SITE, designated SEQ ID:33102, to the nucleotide sequence of VGAM1422 RNA, herein designated VGAM RNA, also designated SEQ ID:4133.

[49601] Another function of VGAM1422 is therefore inhibition of

D15Wsu75e (Accession XM_039495). Accordingly, utilities of VGAM1422 include diagnosis, prevention and treatment of diseases and clinical conditions associated with D15Wsu75e. DLAD (Accession NM_058248) is another VGAM1422 host target gene. DLAD BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DLAD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DLAD BINDING SITE, designated SEQ ID:27779, to the nucleotide sequence of VGAM1422 RNA, herein designated VGAM RNA, also designated SEQ ID:4133.

[49602] Another function of VGAM1422 is therefore inhibition of DLAD (Accession NM_058248). Accordingly, utilities of VGAM1422 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DLAD. DnaJ (Hsp40) Homolog, Subfamily C, Member 8 (DNAJC8, Accession NM_014280) is another VGAM1422 host target gene. DNAJC8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DNAJC8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of DNAJC8 BINDING SITE, designated SEQ ID:15559, to the nucleotide sequence of VGAM1422 RNA, herein designated VGAM RNA, also designated SEQ ID:4133.

[49603] Another function of VGAM1422 is therefore inhibition of DnaJ (Hsp40) Homolog, Subfamily C, Member 8 (DNAJC8, Accession NM_014280). Accordingly, utilities of VGAM1422 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNAJC8. FLJ14751 (Accession NM_032834) is another VGAM1422 host target gene. FLJ14751 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14751, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14751 BINDING SITE, designated SEQ ID:26612, to the nucleotide sequence of VGAM1422 RNA, herein designated VGAM RNA, also designated SEQ ID:4133.

[49604] Another function of VGAM1422 is therefore inhibition of FLJ14751 (Accession NM_032834). Accordingly, utilities of VGAM1422 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ14751. FLJ23548 (Accession NM_024590) is another VGAM1422 host target gene. FLJ23548 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23548, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23548 BINDING SITE, designated SEQ ID:23827, to the nucleotide sequence of VGAM1422 RNA, herein designated VGAM RNA, also designated SEQ ID:4133.

[49605] Another function of VGAM1422 is therefore inhibition of FLJ23548 (Accession NM_024590). Accordingly, utilities of VGAM1422 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23548. KIAA1193 (Accession XM_041843) is another VGAM1422 host target gene. KIAA1193 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1193, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1193 BINDING SITE, designated SEQ ID:33585, to the

nucleotide sequence of VGAM1422 RNA, herein designated VGAM RNA, also designated SEQ ID:4133.

[49606] Another function of VGAM1422 is therefore inhibition of KIAA1193 (Accession XM_041843). Accordingly, utilities of VGAM1422 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1193. KIAA1323 (Accession XM_032146) is another VGAM1422 host target gene. KIAA1323 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1323, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1323 BINDING SITE, designated SEQ ID:31565, to the nucleotide sequence of VGAM1422 RNA, herein designated VGAM RNA, also designated SEQ ID:4133.

[49607] Another function of VGAM1422 is therefore inhibition of KIAA1323 (Accession XM_032146). Accordingly, utilities of VGAM1422 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1323. KIAA1337 (Accession XM_052561) is another VGAM1422 host target gene. KIAA1337 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA1337, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1337 BINDING SITE, designated SEQ ID:35986, to the nucleotide sequence of VGAM1422 RNA, herein designated VGAM RNA, also designated SEQ ID:4133.

[49608] Another function of VGAM1422 is therefore inhibition of KIAA1337 (Accession XM_052561). Accordingly, utilities of VGAM1422 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1337. KIAA1705 (Accession XM_051692) is another VGAM1422 host target gene. KIAA1705 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1705, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1705 BINDING SITE, designated SEQ ID:35861, to the nucleotide sequence of VGAM1422 RNA, herein designated VGAM RNA, also designated SEQ ID:4133.

[49609] Another function of VGAM1422 is therefore inhibition of KIAA1705 (Accession XM_051692). Accordingly, utilities

of VGAM1422 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1705. MGC10715 (Accession NM_024325) is another VGAM1422 host target gene. MGC10715 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC10715, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC10715 BINDING SITE, designated SEQ ID:23616, to the nucleotide sequence of VGAM1422 RNA, herein designated VGAM RNA, also designated SEQ ID:4133.

[49610] Another function of VGAM1422 is therefore inhibition of MGC10715 (Accession NM_024325). Accordingly, utilities of VGAM1422 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10715. MGC20253 (Accession NM_144583) is another VGAM1422 host target gene. MGC20253 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC20253, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

MGC20253 BINDING SITE, designated SEQ ID:29397, to the nucleotide sequence of VGAM1422 RNA, herein designated VGAM RNA, also designated SEQ ID:4133.

[49611] Another function of VGAM1422 is therefore inhibition of MGC20253 (Accession NM_144583). Accordingly, utilities of VGAM1422 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC20253. Phosphodiesterase 2A, CGMP-stimulated (PDE2A, Accession NM_002599) is another VGAM1422 host target gene. PDE2A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PDE2A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDE2A BINDING SITE, designated SEQ ID:8463, to the nucleotide sequence of VGAM1422 RNA, herein designated VGAM RNA, also designated SEQ ID:4133.

[49612] Another function of VGAM1422 is therefore inhibition of Phosphodiesterase 2A, CGMP-stimulated (PDE2A, Accession NM_002599). Accordingly, utilities of VGAM1422 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE2A. LOC123242

(Accession XM_063548) is another VGAM1422 host target gene. LOC123242 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC123242, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC123242 BINDING SITE, designated SEQ ID:37242, to the nucleotide sequence of VGAM1422 RNA, herein designated VGAM RNA, also designated SEQ ID:4133.

[49613] Another function of VGAM1422 is therefore inhibition of LOC123242 (Accession XM_063548). Accordingly, utilities of VGAM1422 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC123242. LOC148114 (Accession XM_086050) is another VGAM1422 host target gene. LOC148114 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC148114, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148114 BINDING SITE, designated SEQ ID:38468, to the nucleotide sequence of VGAM1422 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4133.

[49614] Another function of VGAM1422 is therefore inhibition of LOC148114 (Accession XM_086050). Accordingly, utilities of VGAM1422 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148114. LOC149086 (Accession XM_097580) is another VGAM1422 host target gene. LOC149086 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149086, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149086 BINDING SITE, designated SEQ ID:40946, to the nucleotide sequence of VGAM1422 RNA, herein designated VGAM RNA, also designated SEQ ID:4133.

[49615] Another function of VGAM1422 is therefore inhibition of LOC149086 (Accession XM_097580). Accordingly, utilities of VGAM1422 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149086. LOC151996 (Accession XM_098151) is another VGAM1422 host target gene. LOC151996 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151996, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151996 BINDING SITE, designated SEQ ID:41414, to the nucleotide sequence of VGAM1422 RNA, herein designated VGAM RNA, also designated SEQ ID:4133.

[49616] Another function of VGAM1422 is therefore inhibition of LOC151996 (Accession XM_098151). Accordingly, utilities of VGAM1422 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151996. LOC253001 (Accession XM_171711) is another VGAM1422 host target gene. LOC253001 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253001, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253001 BINDING SITE, designated SEQ ID:46058, to the nucleotide sequence of VGAM1422 RNA, herein designated VGAM RNA, also designated SEQ ID:4133.

[49617] Another function of VGAM1422 is therefore inhibition of LOC253001 (Accession XM_171711). Accordingly, utilities of VGAM1422 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC253001. LOC253256 (Accession XM_171506) is another VGAM1422 host target gene. LOC253256 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC253256, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253256 BINDING SITE, designated SEQ ID:46048, to the nucleotide sequence of VGAM1422 RNA, herein designated VGAM RNA, also designated SEQ ID:4133.

[49618] Another function of VGAM1422 is therefore inhibition of LOC253256 (Accession XM_171506). Accordingly, utilities of VGAM1422 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253256. LOC253847 (Accession XM_171145) is another VGAM1422 host target gene. LOC253847 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC253847, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253847 BINDING SITE, designated SEQ ID:45941, to

the nucleotide sequence of VGAM1422 RNA, herein designated VGAM RNA, also designated SEQ ID:4133.

[49619] Another function of VGAM1422 is therefore inhibition of LOC253847 (Accession XM_171145). Accordingly, utilities of VGAM1422 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253847. LOC92840 (Accession NM_138393) is another VGAM1422 host target gene. LOC92840 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92840, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92840 BINDING SITE, designated SEQ ID:28761, to the nucleotide sequence of VGAM1422 RNA, herein designated VGAM RNA, also designated SEQ ID:4133.

[49620] Another function of VGAM1422 is therefore inhibition of LOC92840 (Accession NM_138393). Accordingly, utilities of VGAM1422 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92840. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 1423 (VGAM1423) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49621] VGAM1423 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1423 was detected is described hereinabove with reference to Figs. 1–8.

[49622] VGAM1423 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis GB Virus A. VGAM1423 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49623] VGAM1423 gene encodes a VGAM1423 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1423 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1423 precursor RNA is designated SEQ ID:1409, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1409 is located at position 8372 relative to the genome of Hepatitis GB Virus A.

[49624] VGAM1423 precursor RNA folds onto itself, forming VGAM1423 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49625] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1423 folded precursor RNA into VGAM1423 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1423 RNA is designated SEQ ID:4134, and is provided hereinbelow with reference to the sequence listing part.

[49626] VGAM1423 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1423 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1423 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[49627] VGAM1423 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1423 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1423 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1423 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1423 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[49628] The complementary binding of VGAM1423 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1423 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1423 host target RNA into VGAM1423 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49629] It is appreciated that VGAM1423 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1423 host target genes. The mRNA of each one of this plurality of VGAM1423 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1423 RNA, herein designated VGAM RNA, and which when bound by VGAM1423 RNA causes inhibition of translation of respective one or more VGAM1423 host target proteins.

[49630] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1423 gene, herein designated VGAM GENE, on one or more VGAM1423 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[49631] It is yet further appreciated that a function of VGAM1423 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1423 include diagnosis, prevention and treatment of viral infection by Hepatitis GB Virus A. Specific functions, and accordingly utilities, of VGAM1423 correlate with, and may be deduced from, the identity of

the host target genes which VGAM1423 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49632] Nucleotide sequences of the VGAM1423 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1423 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1423 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1423 are further described hereinbelow with reference to Table 1.

[49633] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1423 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1423 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49634] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1423 gene, herein designated VGAM is inhibition of expression of VGAM1423 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1423 correlate with, and may be deduced from, the identity of the target genes which VGAM1423

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[49635] Fibroblast Growth Factor 9 (glia-activating factor) (FGF9, Accession NM_002010) is a VGAM1423 host target gene. FGF9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FGF9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGF9 BINDING SITE, designated SEQ ID:7752, to the nucleotide sequence of VGAM1423 RNA, herein designated VGAM RNA, also designated SEQ ID:4134.

[49636] A function of VGAM1423 is therefore inhibition of Fibroblast Growth Factor 9 (glia-activating factor) (FGF9, Accession NM_002010), a gene which Fibroblast growth factor 9 (glia-activating factor); secreted mitogen. Accordingly, utilities of VGAM1423 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGF9. The function of FGF9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM864. Glypican 4 (GPC4, Accession NM_001448) is another VGAM1423 host target gene.

GPC4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GPC4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPC4 BINDING SITE, designated SEQ ID:7176, to the nucleotide sequence of VGAM1423 RNA, herein designated VGAM RNA, also designated SEQ ID:4134.

[49637] Another function of VGAM1423 is therefore inhibition of Glypican 4 (GPC4, Accession NM_001448), a gene which may play a role in growth control and cell division. Accordingly, utilities of VGAM1423 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPC4. The function of GPC4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM538. Multiple Endocrine Neoplasia I (MEN1, Accession XM_167804) is another VGAM1423 host target gene. MEN1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MEN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of MEN1 BINDING SITE, designated SEQ ID:44842, to the nucleotide sequence of VGAM1423 RNA, herein designated VGAM RNA, also designated SEQ ID:4134.

[49638] Another function of VGAM1423 is therefore inhibition of Multiple Endocrine Neoplasia I (MEN1, Accession XM_167804). Accordingly, utilities of VGAM1423 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEN1. Molybdenum Cofactor Synthesis 2 (MOCS2, Accession NM_004531) is another VGAM1423 host target gene. MOCS2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MOCS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MOCS2 BINDING SITE, designated SEQ ID:10874, to the nucleotide sequence of VGAM1423 RNA, herein designated VGAM RNA, also designated SEQ ID:4134.

[49639] Another function of VGAM1423 is therefore inhibition of Molybdenum Cofactor Synthesis 2 (MOCS2, Accession NM_004531). Accordingly, utilities of VGAM1423 include diagnosis, prevention and treatment of diseases and clinical

cal conditions associated with MOCS2. Protein Kinase (cAMP-dependent, catalytic) Inhibitor Beta (PKIB, Accession NM_032471) is another VGAM1423 host target gene. PKIB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PKIB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PKIB BINDING SITE, designated SEQ ID:26230, to the nucleotide sequence of VGAM1423 RNA, herein designated VGAM RNA, also designated SEQ ID:4134.

[49640] Another function of VGAM1423 is therefore inhibition of Protein Kinase (cAMP-dependent, catalytic) Inhibitor Beta (PKIB, Accession NM_032471). Accordingly, utilities of VGAM1423 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PKIB. Presenilin 1 (Alzheimer disease 3) (PSEN1, Accession NM_007318) is another VGAM1423 host target gene. PSEN1 BINDING SITE1 and PSEN1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PSEN1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of PSEN1 BINDING SITE1 and PSEN1 BINDING SITE2, designated SEQ ID:14235 and SEQ ID:5457 respectively, to the nucleotide sequence of VGAM1423 RNA, herein designated VGAM RNA, also designated SEQ ID:4134.

[49641] Another function of VGAM1423 is therefore inhibition of Presenilin 1 (Alzheimer disease 3) (PSEN1, Accession NM_007318). Accordingly, utilities of VGAM1423 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSEN1. Ubiquitin-conjugating Enzyme E2 Variant 1 (UBE2V1, Accession NM_003349) is another VGAM1423 host target gene. UBE2V1 BINDING SITE1 through UBE2V1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by UBE2V1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBE2V1 BINDING SITE1 through UBE2V1 BINDING SITE3, designated SEQ ID:9368, SEQ ID:22520 and SEQ ID:22767 respectively, to the nucleotide sequence of VGAM1423 RNA, herein designated VGAM RNA, also designated SEQ ID:4134.

[49642] Another function of VGAM1423 is therefore inhibition of

Ubiquitin-conjugating Enzyme E2 Variant 1 (UBE2V1, Accession NM_003349), a gene which may play a role in signaling for DNA repair. Accordingly, utilities of VGAM1423 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE2V1. The function of UBE2V1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM155.FLJ12668 (Accession NM_024997) is another VGAM1423 host target gene. FLJ12668 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12668, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12668 BINDING SITE, designated SEQ ID:24559, to the nucleotide sequence of VGAM1423 RNA, herein designated VGAM RNA, also designated SEQ ID:4134.

[49643] Another function of VGAM1423 is therefore inhibition of FLJ12668 (Accession NM_024997). Accordingly, utilities of VGAM1423 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12668. FLJ21916 (Accession NM_023112) is another

VGAM1423 host target gene. FLJ21916 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21916, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21916 BINDING SITE, designated SEQ ID:23386, to the nucleotide sequence of VGAM1423 RNA, herein designated VGAM RNA, also designated SEQ ID:4134.

[49644] Another function of VGAM1423 is therefore inhibition of FLJ21916 (Accession NM_023112). Accordingly, utilities of VGAM1423 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21916. FLJ22127 (Accession NM_022775) is another VGAM1423 host target gene. FLJ22127 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22127, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22127 BINDING SITE, designated SEQ ID:23043, to the nucleotide sequence of VGAM1423 RNA, herein designated VGAM RNA, also designated SEQ ID:4134.

[49645] Another function of VGAM1423 is therefore inhibition of FLJ22127 (Accession NM_022775). Accordingly, utilities of VGAM1423 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22127. FLJ22794 (Accession XM_166220) is another VGAM1423 host target gene. FLJ22794 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ22794, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22794 BINDING SITE, designated SEQ ID:44033, to the nucleotide sequence of VGAM1423 RNA, herein designated VGAM RNA, also designated SEQ ID:4134.

[49646] Another function of VGAM1423 is therefore inhibition of FLJ22794 (Accession XM_166220). Accordingly, utilities of VGAM1423 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22794. KIAA0493 (Accession XM_034717) is another VGAM1423 host target gene. KIAA0493 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0493, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0493 BINDING SITE, designated SEQ ID:32140, to the nucleotide sequence of VGAM1423 RNA, herein designated VGAM RNA, also designated SEQ ID:4134.

[49647] Another function of VGAM1423 is therefore inhibition of KIAA0493 (Accession XM_034717). Accordingly, utilities of VGAM1423 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0493. KIAA0515 (Accession XM_033380) is another VGAM1423 host target gene. KIAA0515 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0515, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0515 BINDING SITE, designated SEQ ID:31929, to the nucleotide sequence of VGAM1423 RNA, herein designated VGAM RNA, also designated SEQ ID:4134.

[49648] Another function of VGAM1423 is therefore inhibition of KIAA0515 (Accession XM_033380). Accordingly, utilities of VGAM1423 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0515. KIAA0795 (Accession NM_025010) is another VGAM1423 host target gene. KIAA0795 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0795, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0795 BINDING SITE, designated SEQ ID:24587, to the nucleotide sequence of VGAM1423 RNA, herein designated VGAM RNA, also designated SEQ ID:4134.

[49649] Another function of VGAM1423 is therefore inhibition of KIAA0795 (Accession NM_025010). Accordingly, utilities of VGAM1423 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0795. KIAA0863 (Accession XM_170863) is another VGAM1423 host target gene. KIAA0863 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0863, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0863 BINDING SITE, designated SEQ ID:45635, to the nucleotide sequence of VGAM1423 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4134.

[49650] Another function of VGAM1423 is therefore inhibition of KIAA0863 (Accession XM_170863). Accordingly, utilities of VGAM1423 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0863. KIAA1068 (Accession NM_015332) is another VGAM1423 host target gene. KIAA1068 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1068, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1068 BINDING SITE, designated SEQ ID:17644, to the nucleotide sequence of VGAM1423 RNA, herein designated VGAM RNA, also designated SEQ ID:4134.

[49651] Another function of VGAM1423 is therefore inhibition of KIAA1068 (Accession NM_015332). Accordingly, utilities of VGAM1423 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1068. KIAA1332 (Accession XM_048774) is another VGAM1423 host target gene. KIAA1332 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1332, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1332 BINDING SITE, designated SEQ ID:35259, to the nucleotide sequence of VGAM1423 RNA, herein designated VGAM RNA, also designated SEQ ID:4134.

[49652] Another function of VGAM1423 is therefore inhibition of KIAA1332 (Accession XM_048774). Accordingly, utilities of VGAM1423 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1332. KIAA1545 (Accession XM_027220) is another VGAM1423 host target gene. KIAA1545 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1545, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1545 BINDING SITE, designated SEQ ID:30442, to the nucleotide sequence of VGAM1423 RNA, herein designated VGAM RNA, also designated SEQ ID:4134.

[49653] Another function of VGAM1423 is therefore inhibition of KIAA1545 (Accession XM_027220). Accordingly, utilities of VGAM1423 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1545. MGC16386 (Accession NM_080668) is another VGAM1423 host target gene. MGC16386 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC16386, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC16386 BINDING SITE, designated SEQ ID:27959, to the nucleotide sequence of VGAM1423 RNA, herein designated VGAM RNA, also designated SEQ ID:4134.

[49654] Another function of VGAM1423 is therefore inhibition of MGC16386 (Accession NM_080668). Accordingly, utilities of VGAM1423 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC16386. MGC2560 (Accession NM_031452) is another VGAM1423 host target gene. MGC2560 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC2560, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2560 BINDING SITE, designated SEQ ID:25467, to the nucleotide

sequence of VGAM1423 RNA, herein designated VGAM RNA, also designated SEQ ID:4134.

[49655] Another function of VGAM1423 is therefore inhibition of MGC2560 (Accession NM_031452). Accordingly, utilities of VGAM1423 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2560. LOC127602 (Accession XM_059166) is another VGAM1423 host target gene. LOC127602 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC127602, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC127602 BINDING SITE, designated SEQ ID:36904, to the nucleotide sequence of VGAM1423 RNA, herein designated VGAM RNA, also designated SEQ ID:4134.

[49656] Another function of VGAM1423 is therefore inhibition of LOC127602 (Accession XM_059166). Accordingly, utilities of VGAM1423 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC127602. LOC149606 (Accession XM_086600) is another VGAM1423 host target gene. LOC149606 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by LOC149606, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149606 BINDING SITE, designated SEQ ID:38786, to the nucleotide sequence of VGAM1423 RNA, herein designated VGAM RNA, also designated SEQ ID:4134.

[49657] Another function of VGAM1423 is therefore inhibition of LOC149606 (Accession XM_086600). Accordingly, utilities of VGAM1423 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149606. LOC149837 (Accession XM_097747) is another VGAM1423 host target gene. LOC149837 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149837, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149837 BINDING SITE, designated SEQ ID:41099, to the nucleotide sequence of VGAM1423 RNA, herein designated VGAM RNA, also designated SEQ ID:4134.

[49658] Another function of VGAM1423 is therefore inhibition of LOC149837 (Accession XM_097747). Accordingly, utilities

of VGAM1423 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149837. LOC199692 (Accession NM_145295) is another VGAM1423 host target gene. LOC199692 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC199692, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199692 BINDING SITE, designated SEQ ID:29811, to the nucleotide sequence of VGAM1423 RNA, herein designated VGAM RNA, also designated SEQ ID:4134.

[49659] Another function of VGAM1423 is therefore inhibition of LOC199692 (Accession NM_145295). Accordingly, utilities of VGAM1423 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199692. LOC202934 (Accession XM_117486) is another VGAM1423 host target gene. LOC202934 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC202934, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC202934 BINDING SITE, designated SEQ ID:43458, to the nucleotide sequence of VGAM1423 RNA, herein designated VGAM RNA, also designated SEQ ID:4134.

[49660] Another function of VGAM1423 is therefore inhibition of LOC202934 (Accession XM_117486). Accordingly, utilities of VGAM1423 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202934. LOC255465 (Accession XM_173206) is another VGAM1423 host target gene. LOC255465 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255465, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255465 BINDING SITE, designated SEQ ID:46451, to the nucleotide sequence of VGAM1423 RNA, herein designated VGAM RNA, also designated SEQ ID:4134.

[49661] Another function of VGAM1423 is therefore inhibition of LOC255465 (Accession XM_173206). Accordingly, utilities of VGAM1423 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255465. LOC257286 (Accession XM_170549) is another VGAM1423 host target gene. LOC257286 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257286, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257286 BINDING SITE, designated SEQ ID:45373, to the nucleotide sequence of VGAM1423 RNA, herein designated VGAM RNA, also designated SEQ ID:4134.

[49662] Another function of VGAM1423 is therefore inhibition of LOC257286 (Accession XM_170549). Accordingly, utilities of VGAM1423 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257286. LOC90979 (Accession XM_035323) is another VGAM1423 host target gene. LOC90979 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90979, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90979 BINDING SITE, designated SEQ ID:32233, to the nucleotide sequence of VGAM1423 RNA, herein designated VGAM RNA, also designated SEQ ID:4134.

[49663] Another function of VGAM1423 is therefore inhibition of

LOC90979 (Accession XM_035323). Accordingly, utilities of VGAM1423 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90979. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1424 (VGAM1424) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49664] VGAM1424 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1424 was detected is described hereinabove with reference to Figs. 1-8.

[49665] VGAM1424 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Clover Yellow Vein Virus. VGAM1424 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49666] VGAM1424 gene encodes a VGAM1424 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1424 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1424 precursor RNA is designated SEQ ID:1410, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1410 is located at position 1464 relative to the genome of Clover Yellow Vein Virus.

- [49667] VGAM1424 precursor RNA folds onto itself, forming VGAM1424 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [49668] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1424 folded precursor RNA into VGAM1424 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide se-

quence of VGAM1424 RNA is designated SEQ ID:4135, and is provided hereinbelow with reference to the sequence listing part.

[49669] VGAM1424 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1424 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1424 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[49670] VGAM1424 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1424 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1424 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM1424 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1424 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[49671] The complementary binding of VGAM1424 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1424 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1424 host target RNA into VGAM1424 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49672] It is appreciated that VGAM1424 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1424 host target genes. The mRNA of each one of this plurality of VGAM1424 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1424 RNA, herein designated VGAM RNA, and which when bound by VGAM1424 RNA causes inhibition of translation of respective one or more VGAM1424 host target proteins.

[49673] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1424 gene, herein designated VGAM GENE, on one or more VGAM1424 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[49674] It is yet further appreciated that a function of VGAM1424

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1424 include diagnosis, prevention and treatment of viral infection by Clover Yellow Vein Virus. Specific functions, and accordingly utilities, of VGAM1424 correlate with, and may be deduced from, the identity of the host target genes which VGAM1424 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49675] Nucleotide sequences of the VGAM1424 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1424 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1424 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1424 are further described hereinbelow with reference to Table 1.

[49676] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1424 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1424 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49677] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1424 gene, herein designated VGAM is inhibition of expression of VGAM1424 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1424 correlate with, and may be deduced from, the identity of the target genes which VGAM1424 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[49678] Syndecan 2 (heparan sulfate proteoglycan 1, cell surface-associated, fibroglycan) (SDC2, Accession XM_040582) is a VGAM1424 host target gene. SDC2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SDC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SDC2 BINDING SITE, designated SEQ ID:33326, to the nucleotide sequence of VGAM1424 RNA, herein designated VGAM RNA, also designated SEQ ID:4135.

[49679] A function of VGAM1424 is therefore inhibition of Syndecan 2 (heparan sulfate proteoglycan 1, cell surface-associated, fibroglycan) (SDC2, Accession XM_040582). Accordingly, utilities of VGAM1424 include diagnosis, pre-

vention and treatment of diseases and clinical conditions associated with SDC2. KIAA0171 (Accession NM_014666) is another VGAM1424 host target gene. KIAA0171 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0171, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0171 BINDING SITE, designated SEQ ID:16121, to the nucleotide sequence of VGAM1424 RNA, herein designated VGAM RNA, also designated SEQ ID:4135.

[49680] Another function of VGAM1424 is therefore inhibition of KIAA0171 (Accession NM_014666). Accordingly, utilities of VGAM1424 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0171. MOST2 (Accession NM_020250) is another VGAM1424 host target gene. MOST2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MOST2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MOST2 BINDING SITE, designated SEQ ID:21548, to the nucleotide se-

quence of VGAM1424 RNA, herein designated VGAM RNA, also designated SEQ ID:4135.

[49681] Another function of VGAM1424 is therefore inhibition of MOST2 (Accession NM_020250). Accordingly, utilities of VGAM1424 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MOST2. Ubiquitin Specific Protease 8 (USP8, Accession NM_005154) is another VGAM1424 host target gene. USP8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by USP8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of USP8 BINDING SITE, designated SEQ ID:11629, to the nucleotide sequence of VGAM1424 RNA, herein designated VGAM RNA, also designated SEQ ID:4135.

[49682] Another function of VGAM1424 is therefore inhibition of Ubiquitin Specific Protease 8 (USP8, Accession NM_005154). Accordingly, utilities of VGAM1424 include diagnosis, prevention and treatment of diseases and clinical conditions associated with USP8. Zinc Finger, DHHC Domain Containing 2 (ZDHHC2, Accession NM_016353) is another VGAM1424 host target gene. ZDHHC2 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZDHHC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZDHHC2 BINDING SITE, designated SEQ ID:18486, to the nucleotide sequence of VGAM1424 RNA, herein designated VGAM RNA, also designated SEQ ID:4135.

[49683] Another function of VGAM1424 is therefore inhibition of Zinc Finger, DHHC Domain Containing 2 (ZDHHC2, Accession NM_016353). Accordingly, utilities of VGAM1424 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZDHHC2. LOC220071 (Accession XM_167848) is another VGAM1424 host target gene. LOC220071 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC220071, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220071 BINDING SITE, designated SEQ ID:44877, to the nucleotide sequence of VGAM1424 RNA, herein designated VGAM RNA, also designated SEQ ID:4135.

[49684] Another function of VGAM1424 is therefore inhibition of LOC220071 (Accession XM_167848). Accordingly, utilities of VGAM1424 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220071. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1425 (VGAM1425) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49685] VGAM1425 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1425 was detected is described hereinabove with reference to Figs. 1–8.

[49686] VGAM1425 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Clover Yellow Vein Virus. VGAM1425 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49687] VGAM1425 gene encodes a VGAM1425 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM1425 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1425 precursor RNA is designated SEQ ID:1411, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1411 is located at position 767 relative to the genome of Clover Yellow Vein Virus.

[49688] VGAM1425 precursor RNA folds onto itself, forming VGAM1425 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49689] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1425 folded precursor RNA into VGAM1425 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1425 RNA is designated SEQ ID:4136, and is provided hereinbelow with reference to the sequence listing part.

[49690] VGAM1425 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1425 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1425 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[49691] VGAM1425 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1425 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1425 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1425 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1425 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[49692] The complementary binding of VGAM1425 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1425 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1425 host target RNA into VGAM1425 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49693] It is appreciated that VGAM1425 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1425 host target genes. The mRNA of each one of this plurality of VGAM1425 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1425 RNA, herein designated VGAM RNA, and which when bound by VGAM1425 RNA causes inhibition of translation of respective one or more VGAM1425 host target proteins.

[49694] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1425 gene, herein designated VGAM GENE, on one or more VGAM1425 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[49695] It is yet further appreciated that a function of VGAM1425 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1425 include diagnosis, prevention and treatment of viral infection by Clover Yellow Vein Virus. Specific functions, and accordingly utilities, of VGAM1425 correlate with, and may be deduced from, the identity of the host target genes which VGAM1425 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49696] Nucleotide sequences of the VGAM1425 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1425 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1425 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1425 are further described hereinbelow with reference to Table 1.

[49697] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1425 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1425 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[49698] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1425 gene, herein designated VGAM is inhibition of expression of VGAM1425 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1425 correlate with, and may be deduced from, the identity of the target genes which VGAM1425 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[49699] Disrupted In Schizophrenia 1 (DISC1, Accession NM_018662) is a VGAM1425 host target gene. DISC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DISC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DISC1 BINDING SITE, designated SEQ ID:20734, to the nucleotide sequence of VGAM1425 RNA, herein designated VGAM RNA, also designated SEQ ID:4136.

[49700] A function of VGAM1425 is therefore inhibition of Disrupted In Schizophrenia 1 (DISC1, Accession NM_018662), a gene which has globular N-terminal domain(s) and a helical C-terminal domain. Accordingly, utilities of

VGAM1425 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DISC1. The function of DISC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74. Vascular Cell Adhesion Molecule 1 (VCAM1, Accession NM_001078) is another VGAM1425 host target gene. VCAM1 BINDING SITE1 and VCAM1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by VCAM1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VCAM1 BINDING SITE1 and VCAM1 BINDING SITE2, designated SEQ ID:6737 and SEQ ID:27983 respectively, to the nucleotide sequence of VGAM1425 RNA, herein designated VGAM RNA, also designated SEQ ID:4136.

[49701] Another function of VGAM1425 is therefore inhibition of Vascular Cell Adhesion Molecule 1 (VCAM1, Accession NM_001078). Accordingly, utilities of VGAM1425 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VCAM1. FLJ10852 (Accession NM_019028) is another VGAM1425 host target

gene. FLJ10852 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10852, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10852 BINDING SITE, designated SEQ ID:21117, to the nucleotide sequence of VGAM1425 RNA, herein designated VGAM RNA, also designated SEQ ID:4136.

[49702] Another function of VGAM1425 is therefore inhibition of FLJ10852 (Accession NM_019028). Accordingly, utilities of VGAM1425 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10852. MGC4643 (Accession NM_032715) is another VGAM1425 host target gene. MGC4643 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC4643, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4643 BINDING SITE, designated SEQ ID:26438, to the nucleotide sequence of VGAM1425 RNA, herein designated VGAM RNA, also designated SEQ ID:4136.

[49703] Another function of VGAM1425 is therefore inhibition of MGC4643 (Accession NM_032715). Accordingly, utilities of VGAM1425 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4643. p25 (Accession NM_007030) is another VGAM1425 host target gene. p25 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by p25, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of p25 BINDING SITE, designated SEQ ID:13890, to the nucleotide sequence of VGAM1425 RNA, herein designated VGAM RNA, also designated SEQ ID:4136.

[49704] Another function of VGAM1425 is therefore inhibition of p25 (Accession NM_007030). Accordingly, utilities of VGAM1425 include diagnosis, prevention and treatment of diseases and clinical conditions associated with p25. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1426 (VGAM1426) viral gene, which modulates expression of respective host target genes thereof, the function and

utility of which host target genes is known in the art.

[49705] VGAM1426 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1426 was detected is described hereinabove with reference to Figs. 1–8.

[49706] VGAM1426 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Clover Yellow Vein Virus. VGAM1426 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49707] VGAM1426 gene encodes a VGAM1426 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1426 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1426 precursor RNA is designated SEQ ID:1412, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1412 is located at position 8366 relative to the genome of Clover Yellow Vein Virus.

[49708] VGAM1426 precursor RNA folds onto itself, forming VGAM1426 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two–

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49709] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1426 folded precursor RNA into VGAM1426 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1426 RNA is designated SEQ ID:4137, and is provided hereinbelow with reference to the sequence listing part.

[49710] VGAM1426 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1426 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1426 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[49711] VGAM1426 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1426 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1426 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1426 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1426 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[49712] The complementary binding of VGAM1426 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1426 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1426 host target RNA into VGAM1426 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49713] It is appreciated that VGAM1426 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1426 host target genes. The mRNA of each one of this plurality of VGAM1426 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1426 RNA, herein designated VGAM RNA, and which when bound by VGAM1426 RNA causes inhibition of translation of respective one or more VGAM1426 host target proteins.

[49714] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1426 gene, herein designated VGAM GENE, on one

or more VGAM1426 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[49715] It is yet further appreciated that a function of VGAM1426 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1426 include diagnosis, prevention and treatment of viral infection by Clover Yellow Vein Virus. Specific functions, and accordingly utilities, of VGAM1426 correlate with, and may be deduced from, the identity of the host target genes which VGAM1426 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49716] Nucleotide sequences of the VGAM1426 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1426 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1426 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1426 are further described hereinbelow with reference to Table 1.

[49717] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1426 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1426 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49718] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1426 gene, herein designated VGAM is inhibition of expression of VGAM1426 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1426 correlate with, and may be deduced from, the identity of the target genes which VGAM1426 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[49719] Fibroblast Growth Factor Receptor 3 (achondroplasia,

thanatophoric dwarfism) (FGFR3, Accession NM_000142) is a VGAM1426 host target gene. FGFR3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FGFR3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGFR3 BINDING SITE, designated SEQ ID:5643, to the nucleotide sequence of VGAM1426 RNA, herein designated VGAM RNA, also designated SEQ ID:4137.

[49720] A function of VGAM1426 is therefore inhibition of Fibroblast Growth Factor Receptor 3 (achondroplasia, thanatophoric dwarfism) (FGFR3, Accession NM_000142). Accordingly, utilities of VGAM1426 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGFR3. Cyclin M4 (CNNM4, Accession NM_020184) is another VGAM1426 host target gene. CNNM4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CNNM4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNNM4 BINDING SITE, designated SEQ

ID:21422, to the nucleotide sequence of VGAM1426 RNA, herein designated VGAM RNA, also designated SEQ ID:4137.

[49721] Another function of VGAM1426 is therefore inhibition of Cyclin M4 (CNNM4, Accession NM_020184). Accordingly, utilities of VGAM1426 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNNM4. DKFZp434N035 (Accession NM_032262) is another VGAM1426 host target gene. DKFZp434N035 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp434N035, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434N035 BINDING SITE, designated SEQ ID:26006, to the nucleotide sequence of VGAM1426 RNA, herein designated VGAM RNA, also designated SEQ ID:4137.

[49722] Another function of VGAM1426 is therefore inhibition of DKFZp434N035 (Accession NM_032262). Accordingly, utilities of VGAM1426 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434N035. MGC13138 (Accession NM_033410)

is another VGAM1426 host target gene. MGC13138 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC13138, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC13138 BINDING SITE, designated SEQ ID:27232, to the nucleotide sequence of VGAM1426 RNA, herein designated VGAM RNA, also designated SEQ ID:4137.

[49723] Another function of VGAM1426 is therefore inhibition of MGC13138 (Accession NM_033410). Accordingly, utilities of VGAM1426 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13138. MIDORI (Accession XM_057651) is another VGAM1426 host target gene. MIDORI BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MIDORI, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MIDORI BINDING SITE, designated SEQ ID:36530, to the nucleotide sequence of VGAM1426 RNA, herein designated VGAM RNA, also designated SEQ ID:4137.

[49724] Another function of VGAM1426 is therefore inhibition of MIDORI (Accession XM_057651). Accordingly, utilities of VGAM1426 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MIDORI. Serine/threonine Kinase 29 (STK29, Accession XM_113646) is another VGAM1426 host target gene. STK29 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STK29, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STK29 BINDING SITE, designated SEQ ID:42319, to the nucleotide sequence of VGAM1426 RNA, herein designated VGAM RNA, also designated SEQ ID:4137.

[49725] Another function of VGAM1426 is therefore inhibition of Serine/threonine Kinase 29 (STK29, Accession XM_113646). Accordingly, utilities of VGAM1426 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STK29. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1427

(VGAM1427) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49726] VGAM1427 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1427 was detected is described hereinabove with reference to Figs. 1-8.

[49727] VGAM1427 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Clover Yellow Vein Virus. VGAM1427 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49728] VGAM1427 gene encodes a VGAM1427 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1427 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1427 precursor RNA is designated SEQ ID:1413, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1413 is located at position 8119 relative to the genome of Clover Yellow Vein Virus.

[49729] VGAM1427 precursor RNA folds onto itself, forming

VGAM1427 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49730] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1427 folded precursor RNA into VGAM1427 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1427 RNA is designated SEQ ID:4138, and is provided hereinbelow with reference to the sequence listing part.

[49731] VGAM1427 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1427 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1427 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[49732] VGAM1427 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1427 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1427 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1427 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1427 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[49733] The complementary binding of VGAM1427 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1427 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1427 host target RNA into VGAM1427 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49734] It is appreciated that VGAM1427 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1427 host target genes. The mRNA of each one of this plurality of VGAM1427 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1427 RNA, herein designated VGAM RNA, and which when bound by VGAM1427 RNA causes inhibition of translation of respective one or more VGAM1427 host target proteins.

[49735] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1427 gene, herein designated VGAM GENE, on one or more VGAM1427 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[49736] It is yet further appreciated that a function of VGAM1427 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1427 include diagnosis, prevention and treatment of viral infection by Clover Yellow Vein Virus. Specific functions, and accordingly utilities, of VGAM1427 correlate with, and may be deduced from, the identity of the host target genes which VGAM1427 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[49737] Nucleotide sequences of the VGAM1427 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1427 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1427 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1427 are further described hereinbelow with reference to Table 1.

[49738] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1427 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1427 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49739] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1427 gene, herein designated VGAM is inhibition of expression of VGAM1427 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1427 correlate with, and may be deduced from, the identity of the target genes which VGAM1427 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[49740] Discs, Large (Drosophila) Homolog 5 (DLG5, Accession XM_096398) is a VGAM1427 host target gene. DLG5 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DLG5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DLG5 BINDING SITE, designated SEQ ID:40341, to the nucleotide sequence of VGAM1427 RNA, herein designated VGAM RNA, also designated SEQ ID:4138.

[49741] A function of VGAM1427 is therefore inhibition of Discs, Large (Drosophila) Homolog 5 (DLG5, Accession XM_096398), a gene which may transmit extracellular signals to inhibit cell proliferation. Accordingly, utilities of VGAM1427 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DLG5. The function of DLG5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM444. Fibronectin Leucine Rich Transmembrane Protein 2 (FLRT2, Accession NM_013231) is another VGAM1427 host target gene. FLRT2 BINDING SITE is HOST

TARGET binding site found in the 3' untranslated region of mRNA encoded by FLRT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLRT2 BINDING SITE, designated SEQ ID:14880, to the nucleotide sequence of VGAM1427 RNA, herein designated VGAM RNA, also designated SEQ ID:4138.

[49742] Another function of VGAM1427 is therefore inhibition of Fibronectin Leucine Rich Transmembrane Protein 2 (FLRT2, Accession NM_013231), a gene which may have a function in cell adhesion and/or receptor signaling. Accordingly, utilities of VGAM1427 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLRT2. The function of FLRT2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM247. Nebulin-related Anchoring Protein (Nrap, Accession NM_139235) is another VGAM1427 host target gene. Nrap BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by Nrap, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Nrap BINDING SITE, designated SEQ ID:29237, to the nucleotide sequence of VGAM1427 RNA, herein designated VGAM RNA, also designated SEQ ID:4138.

[49743] Another function of VGAM1427 is therefore inhibition of Nebulin-related Anchoring Protein (Nrap, Accession NM_139235), a gene which performs an anchoring function to link the terminal actin filaments of myofibrils to protein complexes located beneath the sarcolemma. Accordingly, utilities of VGAM1427 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Nrap. The function of Nrap and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM649.CDC14 Cell Division Cycle 14 Homolog B (*S. cerevisiae*) (CDC14B, Accession NM_033332) is another VGAM1427 host target gene. CDC14B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CDC14B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of CDC14B BINDING SITE, designated SEQ ID:27173, to the nucleotide sequence of VGAM1427 RNA, herein designated VGAM RNA, also designated SEQ ID:4138.

[49744] Another function of VGAM1427 is therefore inhibition of CDC14 Cell Division Cycle 14 Homolog B (*S. cerevisiae*) (CDC14B, Accession NM_033332). Accordingly, utilities of VGAM1427 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDC14B. DKFZP434C1715 (Accession XM_098421) is another VGAM1427 host target gene. DKFZP434C1715 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434C1715, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434C1715 BINDING SITE, designated SEQ ID:41677, to the nucleotide sequence of VGAM1427 RNA, herein designated VGAM RNA, also designated SEQ ID:4138.

[49745] Another function of VGAM1427 is therefore inhibition of DKFZP434C1715 (Accession XM_098421). Accordingly, utilities of VGAM1427 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with DKFZP434C1715. KIAA0171 (Accession NM_014666) is another VGAM1427 host target gene. KIAA0171 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0171, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0171 BINDING SITE, designated SEQ ID:16123, to the nucleotide sequence of VGAM1427 RNA, herein designated VGAM RNA, also designated SEQ ID:4138.

[49746] Another function of VGAM1427 is therefore inhibition of KIAA0171 (Accession NM_014666). Accordingly, utilities of VGAM1427 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0171. KIAA0420 (Accession XM_032693) is another VGAM1427 host target gene. KIAA0420 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0420, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0420 BINDING SITE, designated SEQ ID:31729, to the

nucleotide sequence of VGAM1427 RNA, herein designated VGAM RNA, also designated SEQ ID:4138.

[49747] Another function of VGAM1427 is therefore inhibition of KIAA0420 (Accession XM_032693). Accordingly, utilities of VGAM1427 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0420. MGC4655 (Accession NM_033309) is another VGAM1427 host target gene. MGC4655 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC4655, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4655 BINDING SITE, designated SEQ ID:27148, to the nucleotide sequence of VGAM1427 RNA, herein designated VGAM RNA, also designated SEQ ID:4138.

[49748] Another function of VGAM1427 is therefore inhibition of MGC4655 (Accession NM_033309). Accordingly, utilities of VGAM1427 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4655. Phosphodiesterase 10A (PDE10A, Accession NM_006661) is another VGAM1427 host target gene. PDE10A BINDING SITE is HOST TARGET binding site found

in the 3` untranslated region of mRNA encoded by PDE10A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDE10A BINDING SITE, designated SEQ ID:13465, to the nucleotide sequence of VGAM1427 RNA, herein designated VGAM RNA, also designated SEQ ID:4138.

[49749] Another function of VGAM1427 is therefore inhibition of Phosphodiesterase 10A (PDE10A, Accession NM_006661). Accordingly, utilities of VGAM1427 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE10A. PPI5PIV (Accession NM_019892) is another VGAM1427 host target gene. PPI5PIV BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PPI5PIV, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPI5PIV BINDING SITE, designated SEQ ID:21278, to the nucleotide sequence of VGAM1427 RNA, herein designated VGAM RNA, also designated SEQ ID:4138.

[49750] Another function of VGAM1427 is therefore inhibition of PPI5PIV (Accession NM_019892). Accordingly, utilities of VGAM1427 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPI5PIV. RDH-E2 (Accession NM_138969) is another VGAM1427 host target gene. RDH-E2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RDH-E2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RDH-E2 BINDING SITE, designated SEQ ID:29080, to the nucleotide sequence of VGAM1427 RNA, herein designated VGAM RNA, also designated SEQ ID:4138.

[49751] Another function of VGAM1427 is therefore inhibition of RDH-E2 (Accession NM_138969). Accordingly, utilities of VGAM1427 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RDH-E2. LOC147632 (Accession NM_138478) is another VGAM1427 host target gene. LOC147632 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147632, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147632 BINDING SITE, designated SEQ ID:28828, to the nucleotide sequence of VGAM1427 RNA, herein designated VGAM RNA, also designated SEQ ID:4138.

[49752] Another function of VGAM1427 is therefore inhibition of LOC147632 (Accession NM_138478). Accordingly, utilities of VGAM1427 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147632. LOC155061 (Accession XM_088139) is another VGAM1427 host target gene. LOC155061 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC155061, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155061 BINDING SITE, designated SEQ ID:39535, to the nucleotide sequence of VGAM1427 RNA, herein designated VGAM RNA, also designated SEQ ID:4138.

[49753] Another function of VGAM1427 is therefore inhibition of LOC155061 (Accession XM_088139). Accordingly, utilities of VGAM1427 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC155061. LOC255252 (Accession XM_170779) is another VGAM1427 host target gene. LOC255252 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255252, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255252 BINDING SITE, designated SEQ ID:45547, to the nucleotide sequence of VGAM1427 RNA, herein designated VGAM RNA, also designated SEQ ID:4138.

[49754] Another function of VGAM1427 is therefore inhibition of LOC255252 (Accession XM_170779). Accordingly, utilities of VGAM1427 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255252. LOC257354 (Accession XM_170810) is another VGAM1427 host target gene. LOC257354 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257354, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257354 BINDING SITE, designated SEQ ID:45582, to the nucleotide sequence of VGAM1427 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4138.

[49755] Another function of VGAM1427 is therefore inhibition of LOC257354 (Accession XM_170810). Accordingly, utilities of VGAM1427 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257354. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1428 (VGAM1428) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49756] VGAM1428 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1428 was detected is described hereinabove with reference to Figs. 1–8.

[49757] VGAM1428 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Clover Yellow Vein Virus. VGAM1428 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49758] VGAM1428 gene encodes a VGAM1428 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM1428 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1428 precursor RNA is designated SEQ ID:1414, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1414 is located at position 1573 relative to the genome of Clover Yellow Vein Virus.

- [49759] VGAM1428 precursor RNA folds onto itself, forming VGAM1428 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [49760] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1428 folded precursor RNA into VGAM1428 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM1428 RNA is designated SEQ ID:4139, and is provided hereinbelow with reference to the sequence listing part.

[49761] VGAM1428 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1428 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1428 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[49762] VGAM1428 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1428 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1428 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1428 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1428 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[49763] The complementary binding of VGAM1428 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1428 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1428 host target RNA into VGAM1428 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49764] It is appreciated that VGAM1428 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1428 host target genes. The mRNA of

each one of this plurality of VGAM1428 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1428 RNA, herein designated VGAM RNA, and which when bound by VGAM1428 RNA causes inhibition of translation of respective one or more VGAM1428 host target proteins.

[49765] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1428 gene, herein designated VGAM GENE, on one or more VGAM1428 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[49766] It is yet further appreciated that a function of VGAM1428 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1428 include diagnosis, prevention and treatment of viral infection by Clover Yellow Vein Virus. Specific functions, and accordingly utilities, of VGAM1428 correlate with, and may be deduced from, the identity of the host target genes which VGAM1428 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49767] Nucleotide sequences of the VGAM1428 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1428 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1428 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1428 are further described hereinbelow with reference to Table 1.

[49768] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1428 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1428 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49769] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1428 gene, herein designated VGAM is inhibition of expression of VGAM1428 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1428 correlate with, and may be deduced from, the identity of the target genes which VGAM1428 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[49770] Ankylosis, Progressive Homolog (mouse) (ANKH, Accession NM_054027) is a VGAM1428 host target gene. ANKH BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ANKH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ANKH BINDING SITE, designated SEQ ID:27637, to the nucleotide sequence of VGAM1428 RNA, herein designated VGAM RNA, also designated SEQ ID:4139.

[49771] A function of VGAM1428 is therefore inhibition of Ankylosis, Progressive Homolog (mouse) (ANKH, Accession NM_054027), a gene which regulates intra- and extracel-

lular levels of inorganic pyrophosphate (ppi), probably functioning as ppi transporter. Accordingly, utilities of VGAM1428 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANKH. The function of ANKH and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1247. Calcitonin Receptor (CALCR, Accession NM_001742) is another VGAM1428 host target gene. CALCR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CALCR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CALCR BINDING SITE, designated SEQ ID:7476, to the nucleotide sequence of VGAM1428 RNA, herein designated VGAM RNA, also designated SEQ ID:4139.

[49772] Another function of VGAM1428 is therefore inhibition of Calcitonin Receptor (CALCR, Accession NM_001742), a gene which is a receptor for calcitonin, is mediated by g proteins which activate adenylyl cyclase, and thought to couple to the heterotrimeric guanosine triphosphate-bind-

ing protein that is sensitive to cholera toxin. Accordingly, utilities of VGAM1428 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CALCR. The function of CALCR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM94. Transferrin Receptor (p90, CD71) (TFRC, Accession NM_003234) is another VGAM1428 host target gene. TFRC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TFRC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TFRC BINDING SITE, designated SEQ ID:9227, to the nucleotide sequence of VGAM1428 RNA, herein designated VGAM RNA, also designated SEQ ID:4139.

[49773] Another function of VGAM1428 is therefore inhibition of Transferrin Receptor (p90, CD71) (TFRC, Accession NM_003234), a gene which is involved in the transferrin cycle and iron adsorption. Accordingly, utilities of VGAM1428 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TFRC.

The function of TFRC has been established by previous studies. A monoclonal antibody, OKT-9, recognizes an antigen ubiquitously distributed on the cell surface of actively growing human cells. It is a glycoprotein composed of disulfide-linked polypeptide chains, each of 90,000 daltons molecular weight. Immunoprecipitation of the OKT-9 antigen in the presence of labeled transferrin results in specific precipitation of transferrin (Sutherland et al., 1981); thus, the OKT-9 antigen is presumably transferrin receptor. Nikinmaa and Schroder (1987) concluded that p90 and TFRC are the same protein: studies using monoclonal antibodies indicated that exhaustive precipitation of radioactively labeled lysates with one antibody removed all activity of lysates with the other. Peptide maps of antigens recognized with both antibodies showed great similarity and indicated that both antibodies react with the same antigen, the human transferrin receptor, but with different antigenic sites of the molecule. Casey et al. (1988) analyzed the regulation by iron of the TFRC gene by examining mouse cells transformed with chimeric constructs containing the human transferrin receptor gene's promoter and either the structural gene for bacterial chloramphenicol acetyltransferase or the human TFRC

cDNA. They concluded that at least 2 genetic elements, one 5-prime and one 3-prime to the gene, are involved in the regulation of the TFRC gene by iron. Animal model experiments lend further support to the function of TFRC. Levy et al. (1999) disrupted the transferrin receptor gene, which they termed *Trfr*, in mice. Homozygous mutant mice were not viable beyond embryonic day 12.5 and had severe anemia with hydrops as well as diffuse neurologic abnormalities. There was some variation of onset of severe anemia, and in nonanemic embryos without tissue edema and necrosis (E9.5), both stressed erythropoiesis and neurologic abnormalities were apparent. The authors concluded that inadequate iron led to neuronal apoptosis, but that tissues other than erythrocytes and neurons can obtain sufficient iron for growth and development through mechanisms independent of the transferrin cycle. Haploinsufficiency for the transferrin receptor resulted in microcytic, hypochromic erythrocytes; normal hemoglobin and hematocrit values were due to compensatory increase in red cell numbers. Although iron saturation of serum transferrin was indistinguishable from that of wildtype, heterozygotes had significantly less tissue iron.

[49774] It is appreciated that the abovementioned animal model

for TFRC is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[49775] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[49776] Nikinmaa, B.; Schroder, J. : Two antigens, the transferrin receptor and p90 assigned to human chromosome 3, are probably the same protein. *Hereditas* 107: 55–58, 1987. ; and

[49777] Levy, J. E.; Jin, O.; Fujiwara, Y.; Kuo, F.; Andrews, N. C. : Transferrin receptor is necessary for development of erythrocytes and the nervous system. *Nature Genet.* 21: 396–399, 1999.

[49778] Further studies establishing the function and utilities of TFRC are found in John Hopkins OMIM database record ID 190010, and in cited publications numbered 10757–10414, 10421–10420, 10422–10424, 55 and 10425–10426 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. BM–002 (Accession NM_016617) is another VGAM1428 host target gene. BM–002 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by BM-002, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BM-002 BINDING SITE, designated SEQ ID:18726, to the nucleotide sequence of VGAM1428 RNA, herein designated VGAM RNA, also designated SEQ ID:4139.

[49779] Another function of VGAM1428 is therefore inhibition of BM-002 (Accession NM_016617). Accordingly, utilities of VGAM1428 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BM-002. SEC15L (Accession XM_051147) is another VGAM1428 host target gene. SEC15L BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEC15L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEC15L BINDING SITE, designated SEQ ID:35766, to the nucleotide sequence of VGAM1428 RNA, herein designated VGAM RNA, also designated SEQ ID:4139.

[49780] Another function of VGAM1428 is therefore inhibition of SEC15L (Accession XM_051147). Accordingly, utilities of

VGAM1428 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEC15L. LOC51667 (Accession NM_016118) is another VGAM1428 host target gene. LOC51667 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51667, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51667 BINDING SITE, designated SEQ ID:18199, to the nucleotide sequence of VGAM1428 RNA, herein designated VGAM RNA, also designated SEQ ID:4139.

[49781] Another function of VGAM1428 is therefore inhibition of LOC51667 (Accession NM_016118). Accordingly, utilities of VGAM1428 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51667. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1429 (VGAM1429) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49782] VGAM1429 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1429 was detected is described hereinabove with reference to Figs. 1–8.

[49783] VGAM1429 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Clover Yellow Vein Virus. VGAM1429 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49784] VGAM1429 gene encodes a VGAM1429 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1429 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1429 precursor RNA is designated SEQ ID:1415, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1415 is located at position 913 relative to the genome of Clover Yellow Vein Virus.

[49785] VGAM1429 precursor RNA folds onto itself, forming VGAM1429 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49786] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1429 folded precursor RNA into VGAM1429 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM1429 RNA is designated SEQ ID:4140, and is provided hereinbelow with reference to the sequence listing part.

[49787] VGAM1429 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1429 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1429 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[49788] VGAM1429 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1429 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1429 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1429 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1429 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[49789] The complementary binding of VGAM1429 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1429 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1429 host target RNA into VGAM1429 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49790] It is appreciated that VGAM1429 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1429 host target genes. The mRNA of each one of this plurality of VGAM1429 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1429 RNA, herein designated VGAM RNA, and which when bound by VGAM1429 RNA causes inhibition of translation of respective one or more VGAM1429 host target proteins.

[49791] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1429 gene, herein designated VGAM GENE, on one or more VGAM1429 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[49792] It is yet further appreciated that a function of VGAM1429 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1429 include diagnosis, prevention and treatment of viral infection by Clover Yellow Vein Virus. Specific functions, and accordingly utilities, of VGAM1429 correlate with, and may be deduced from, the identity of the host target genes which VGAM1429 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49793] Nucleotide sequences of the VGAM1429 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the
`diced` VGAM1429 RNA, herein designated VGAM RNA,
and a schematic representation of the secondary folding
of VGAM1429 folded precursor RNA, herein designated
VGAM FOLDED PRECURSOR RNA, of VGAM1429 are further
described hereinbelow with reference to Table 1.

[49794] Nucleotide sequences of host target binding sites, such as
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of
Fig. 1, found on VGAM1429 host target RNA, and
schematic representation of the complementarity of each
of these host target binding sites to VGAM1429 RNA,
herein designated VGAM RNA, are described hereinbelow
with reference to Table 2.

[49795] As mentioned hereinabove with reference to Fig. 1, a
function of VGAM1429 gene, herein designated VGAM is
inhibition of expression of VGAM1429 target genes. It is
appreciated that specific functions, and accordingly utili-
ties, of VGAM1429 correlate with, and may be deduced
from, the identity of the target genes which VGAM1429
binds and inhibits, and the function of these target genes,
as elaborated hereinbelow.

[49796] A Kinase (PRKA) Anchor Protein 13 (AKAP13, Accession
XM_116974) is a VGAM1429 host target gene. AKAP13

BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AKAP13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AKAP13 BINDING SITE, designated SEQ ID:43173, to the nucleotide sequence of VGAM1429 RNA, herein designated VGAM RNA, also designated SEQ ID:4140.

[49797] A function of VGAM1429 is therefore inhibition of A Kinase (PRKA) Anchor Protein 13 (AKAP13, Accession XM_116974), a gene which regulates subcellular localization of type II cAMP-dependent PKA. Accordingly, utilities of VGAM1429 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKAP13. The function of AKAP13 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM17. Cytochrome P450, Subfamily XIX (aromatization of androgens) (CYP19, Accession NM_000103) is another VGAM1429 host target gene. CYP19 BINDING SITE1 and CYP19 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CYP19, corresponding to HOST TARGET

binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYP19 BINDING SITE1 and CYP19 BINDING SITE2, designated SEQ ID:5563 and SEQ ID:25273 respectively, to the nucleotide sequence of VGAM1429 RNA, herein designated VGAM RNA, also designated SEQ ID:4140.

[49798] Another function of VGAM1429 is therefore inhibition of Cytochrome P450, Subfamily XIX (aromatization of androgens) (CYP19, Accession NM_000103), a gene which catalyzes the last steps of estrogen biosynthesis. Accordingly, utilities of VGAM1429 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP19. The function of CYP19 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM508.KIAA1676 (Accession XM_167612) is another VGAM1429 host target gene. KIAA1676 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1676, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of KIAA1676 BINDING SITE, designated SEQ ID:44724, to the nucleotide sequence of VGAM1429 RNA, herein designated VGAM RNA, also designated SEQ ID:4140.

[49799] Another function of VGAM1429 is therefore inhibition of KIAA1676 (Accession XM_167612). Accordingly, utilities of VGAM1429 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1676. KIAA1796 (Accession XM_166146) is another VGAM1429 host target gene. KIAA1796 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1796, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1796 BINDING SITE, designated SEQ ID:43961, to the nucleotide sequence of VGAM1429 RNA, herein designated VGAM RNA, also designated SEQ ID:4140.

[49800] Another function of VGAM1429 is therefore inhibition of KIAA1796 (Accession XM_166146). Accordingly, utilities of VGAM1429 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1796. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1430 (VGAM1430) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49801] VGAM1430 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1430 was detected is described hereinabove with reference to Figs. 1–8.

[49802] VGAM1430 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Clover Yellow Vein Virus. VGAM1430 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49803] VGAM1430 gene encodes a VGAM1430 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1430 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1430 precursor RNA is designated SEQ ID:1416, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:1416 is located at position 6030 relative to the genome of Clover Yellow Vein Virus.

[49804] VGAM1430 precursor RNA folds onto itself, forming VGAM1430 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49805] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1430 folded precursor RNA into VGAM1430 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of VGAM1430 RNA is designated SEQ ID:4141, and is provided hereinbelow with reference to the sequence listing part.

[49806] VGAM1430 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1430 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1430 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[49807] VGAM1430 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1430 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1430 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1430 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1430 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[49808] The complementary binding of VGAM1430 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1430 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1430 host target RNA into VGAM1430 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49809] It is appreciated that VGAM1430 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1430 host target genes. The mRNA of each one of this plurality of VGAM1430 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1430 RNA, herein designated VGAM RNA, and which when bound by VGAM1430 RNA causes inhibition of translation of respective one or more

VGAM1430 host target proteins.

[49810] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1430 gene, herein designated VGAM GENE, on one or more VGAM1430 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[49811] It is yet further appreciated that a function of VGAM1430 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1430 include diagnosis, prevention and treatment of viral infection by Clover Yellow Vein Virus.

Specific functions, and accordingly utilities, of VGAM1430 correlate with, and may be deduced from, the identity of the host target genes which VGAM1430 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49812] Nucleotide sequences of the VGAM1430 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1430 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1430 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1430 are further described hereinbelow with reference to Table 1.

[49813] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1430 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1430 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49814] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1430 gene, herein designated VGAM is inhibition of expression of VGAM1430 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM1430 correlate with, and may be deduced from, the identity of the target genes which VGAM1430 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[49815] B-cell CLL/lymphoma 7B (BCL7B, Accession NM_001707) is a VGAM1430 host target gene. BCL7B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BCL7B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL7B BINDING SITE, designated SEQ ID:7436, to the nucleotide sequence of VGAM1430 RNA, herein designated VGAM RNA, also designated SEQ ID:4141.

[49816] A function of VGAM1430 is therefore inhibition of B-cell CLL/lymphoma 7B (BCL7B, Accession NM_001707), a gene which is of yet unknown function. Accordingly, utilities of VGAM1430 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL7B. The function of BCL7B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1189.Forkhead Box O1A (rhabdomyosarcoma)

(FOXO1A, Accession NM_002015) is another VGAM1430 host target gene. FOXO1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FOXO1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FOXO1A BINDING SITE, designated SEQ ID:7759, to the nucleotide sequence of VGAM1430 RNA, herein designated VGAM RNA, also designated SEQ ID:4141.

[49817] Another function of VGAM1430 is therefore inhibition of Forkhead Box O1A (rhabdomyosarcoma) (FOXO1A, Accession NM_002015), a gene which is a probable transcription factor. Accordingly, utilities of VGAM1430 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FOXO1A. The function of FOXO1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM228. Kruppel-like Factor 7 (ubiquitous) (KLF7, Accession NM_003709) is another VGAM1430 host target gene. KLF7 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by

KLF7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KLF7 BINDING SITE, designated SEQ ID:9810, to the nucleotide sequence of VGAM1430 RNA, herein designated VGAM RNA, also designated SEQ ID:4141.

[49818] Another function of VGAM1430 is therefore inhibition of Kruppel-like Factor 7 (ubiquitous) (KLF7, Accession NM_003709), a gene which is a transcriptional activator. Accordingly, utilities of VGAM1430 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLF7. The function of KLF7 has been established by previous studies. Shields et al. (1996) cloned a mouse cDNA, which they named gut-enriched Kruppel-like factor (Gklf), that encodes a member of the Kruppel family of transcription factors. Immunofluorescence revealed that Gklf is localized to the nucleus and is found at highest levels in growth-arrested cells. Shields et al. (1996) found that transfection of Gklf into COS-1 cells causes an inhibition of DNA synthesis. In the mouse, the authors found that Gklf mRNA is most abundant in the colon and is also expressed in the testis, lung, and small intestine. Garrett-Sinha et al. (1996) identified a novel

zinc finger protein whose mRNA is expressed at high levels in the epidermal layer of the skin and in epithelial cells in the tongue, palate, esophagus, stomach, and colon of newborn mice. They named the protein EZF for 'epithelial zinc finger.' By screening a human umbilical vein endothelial cell cDNA library with a cDNA encoding the C-terminal zinc finger region of EKLF (KLF1; 600599), Yet et al. (1998) isolated a cDNA encoding KLF4, which they called EZF. The predicted 470-amino acid KLF4 protein has a proline- and serine-rich N terminus and contains 3 C₂H₂ Kruppel-type zinc fingers at the C terminus. KLF4 also contains a potential nuclear localization signal. The human KLF4 protein shares 91% sequence identity with mouse Ezf. Recombinant KLF4 bound specifically to a probe containing the CACCC core sequence in gel mobility shift assays. In contrast to other members of the EKLF family, which are transcriptional activators, KLF4 functioned as a transcriptional repressor in transient transfection studies. The authors identified both the repression domain and the activation domain within KLF4. Northern blot analysis detected a 3.5-kb KLF4 transcript in RNA from both human umbilical vein endothelial cells and human aortic endothelial cells. By radiation hybrid mapping,

Yet et al. (1998) mapped the human KLF4 gene to 9q31. Garrett-Sinha et al. (1996) mapped the mouse EZF gene to chromosome 4, in close proximity to the thioredoxin gene (OMIM Ref. No. 187700). Animal model experiments lend further support to the function of KLF7. Located at the interface between body and environment, the epidermis must protect the body against toxic agents and dehydration, and protect itself against physical and mechanical stresses. Acquired just before birth and at the last stage of epidermal differentiation, the skin's proteinaceous/lipid barrier creates a surface seal essential for protecting animals against microbial infections and dehydration. Segre et al. (1999) showed that Kruppel-like factor-4 (KLF4), highly expressed in the differentiating layers of epidermis, is both vital to and selective for barrier acquisition. Klf4 -/- mice die shortly after birth due to loss of skin barrier function, as measured by penetration of external dyes and rapid loss of body fluids. The defect was not corrected by grafting of Klf4 -/- skin onto nude mice. Loss of the barrier occurred without morphologic or biochemical alterations to the well-known structural features of epidermis that are essential for mechanical integrity. Instead, late-stage differentiation structures were selectively perturbed,

including the cornified envelope, a likely scaffold for lipid organization. Using suppressive hybridization, Segre et al. (1999) identified 3 transcripts encoding cornified envelope proteins with altered expression in the absence of Klf4. Sprr2a (OMIM Ref. No. 182267) was one, this being the only epidermal gene whose promoter is known to possess a functional Klf4 binding site. These studies provide a new insight into transcriptional governance of barrier function, and pave the way for unraveling the molecular events that orchestrate this essential process

[49819] It is appreciated that the abovementioned animal model for KLF7 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[49820] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[49821] Garrett-Sinha, L. A.; Eberspaecher, H.; Seldin, M. F.; de Crombrughe, B. : A gene for a novel zinc-finger protein expressed in differentiated epithelial cells and transiently in certain mesenchymal cells. J. Biol. Chem. 271: 31384-31390, 1996. ; and

[49822] Segre, J. A.; Bauer, C.; Fuchs, E. : Klf4 is a transcription

factor required for establishing the barrier function of the skin. Nature Genet. 22: 356–360, 1999.

[49823] Further studies establishing the function and utilities of KLF7 are found in John Hopkins OMIM database record ID 604865, and in cited publications numbered 2313 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Mitogen-activated Protein Kinase 4 (MAPK4, Accession NM_002747) is another VGAM1430 host target gene. MAPK4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAPK4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAPK4 BINDING SITE, designated SEQ ID:8624, to the nucleotide sequence of VGAM1430 RNA, herein designated VGAM RNA, also designated SEQ ID:4141.

[49824] Another function of VGAM1430 is therefore inhibition of Mitogen-activated Protein Kinase 4 (MAPK4, Accession NM_002747), a gene which phosphorylates microtubule-associated protein-2 may promote entry into the cell cycle. Accordingly, utilities of VGAM1430 include diagnosis, prevention and treatment of diseases and clinical condi-

tions associated with MAPK4. The function of MAPK4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM655.FLJ12221 (Accession XM_031342) is another VGAM1430 host target gene. FLJ12221 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12221, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12221 BINDING SITE, designated SEQ ID:31345, to the nucleotide sequence of VGAM1430 RNA, herein designated VGAM RNA, also designated SEQ ID:4141.

[49825] Another function of VGAM1430 is therefore inhibition of FLJ12221 (Accession XM_031342). Accordingly, utilities of VGAM1430 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12221. FLJ13110 (Accession NM_022912) is another VGAM1430 host target gene. FLJ13110 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13110, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13110 BINDING SITE, designated SEQ ID:23218, to the nucleotide sequence of VGAM1430 RNA, herein designated VGAM RNA, also designated SEQ ID:4141.

[49826] Another function of VGAM1430 is therefore inhibition of FLJ13110 (Accession NM_022912). Accordingly, utilities of VGAM1430 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13110. KIAA0350 (Accession XM_028332) is another VGAM1430 host target gene. KIAA0350 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0350, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0350 BINDING SITE, designated SEQ ID:30669, to the nucleotide sequence of VGAM1430 RNA, herein designated VGAM RNA, also designated SEQ ID:4141.

[49827] Another function of VGAM1430 is therefore inhibition of KIAA0350 (Accession XM_028332). Accordingly, utilities of VGAM1430 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0350. KIAA1209 (Accession XM_027307) is another VGAM1430 host target gene. KIAA1209 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1209, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1209 BINDING SITE, designated SEQ ID:30473, to the nucleotide sequence of VGAM1430 RNA, herein designated VGAM RNA, also designated SEQ ID:4141.

[49828] Another function of VGAM1430 is therefore inhibition of KIAA1209 (Accession XM_027307). Accordingly, utilities of VGAM1430 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1209. Mitochondrial Ribosomal Protein L48 (MRPL48, Accession NM_016055) is another VGAM1430 host target gene. MRPL48 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MRPL48, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MRPL48 BINDING SITE, designated SEQ ID:18128, to the nucleotide sequence of VGAM1430 RNA,

herein designated VGAM RNA, also designated SEQ ID:4141.

[49829] Another function of VGAM1430 is therefore inhibition of Mitochondrial Ribosomal Protein L48 (MRPL48, Accession NM_016055). Accordingly, utilities of VGAM1430 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPL48. LOC204084 (Accession XM_115181) is another VGAM1430 host target gene. LOC204084 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC204084, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC204084 BINDING SITE, designated SEQ ID:43089, to the nucleotide sequence of VGAM1430 RNA, herein designated VGAM RNA, also designated SEQ ID:4141.

[49830] Another function of VGAM1430 is therefore inhibition of LOC204084 (Accession XM_115181). Accordingly, utilities of VGAM1430 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC204084. LOC221964 (Accession XM_168342) is another VGAM1430 host target gene. LOC221964 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221964, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221964 BINDING SITE, designated SEQ ID:45110, to the nucleotide sequence of VGAM1430 RNA, herein designated VGAM RNA, also designated SEQ ID:4141.

[49831] Another function of VGAM1430 is therefore inhibition of LOC221964 (Accession XM_168342). Accordingly, utilities of VGAM1430 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221964. LOC51107 (Accession NM_016022) is another VGAM1430 host target gene. LOC51107 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51107, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51107 BINDING SITE, designated SEQ ID:18099, to the nucleotide sequence of VGAM1430 RNA, herein designated VGAM RNA, also designated SEQ ID:4141.

[49832] Another function of VGAM1430 is therefore inhibition of

LOC51107 (Accession NM_016022). Accordingly, utilities of VGAM1430 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51107. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1431 (VGAM1431) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49833] VGAM1431 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1431 was detected is described hereinabove with reference to Figs. 1-8.

[49834] VGAM1431 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Potato Virus A.

VGAM1431 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49835] VGAM1431 gene encodes a VGAM1431 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1431 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1431 precursor RNA is designated SEQ ID:1417, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1417 is located at position 4277 relative to the genome of Potato Virus A.

- [49836] VGAM1431 precursor RNA folds onto itself, forming VGAM1431 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [49837] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1431 folded precursor RNA into VGAM1431 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 59%) nucleotide se-

quence of VGAM1431 RNA is designated SEQ ID:4142, and is provided hereinbelow with reference to the sequence listing part.

[49838] VGAM1431 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1431 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1431 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[49839] VGAM1431 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1431 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1431 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM1431 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1431 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[49840] The complementary binding of VGAM1431 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1431 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1431 host target RNA into VGAM1431 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49841] It is appreciated that VGAM1431 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1431 host target genes. The mRNA of each one of this plurality of VGAM1431 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1431 RNA, herein designated VGAM RNA, and which when bound by VGAM1431 RNA causes inhibition of translation of respective one or more VGAM1431 host target proteins.

[49842] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1431 gene, herein designated VGAM GENE, on one or more VGAM1431 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[49843] It is yet further appreciated that a function of VGAM1431

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1431 include diagnosis, prevention and treatment of viral infection by Potato Virus A. Specific functions, and accordingly utilities, of VGAM1431 correlate with, and may be deduced from, the identity of the host target genes which VGAM1431 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49844] Nucleotide sequences of the VGAM1431 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1431 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1431 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1431 are further described hereinbelow with reference to Table 1.

[49845] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1431 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1431 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49846] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1431 gene, herein designated VGAM is inhibition of expression of VGAM1431 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1431 correlate with, and may be deduced from, the identity of the target genes which VGAM1431 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[49847] CDC7 Cell Division Cycle 7-like 1 (*S. cerevisiae*) (CDC7L1, Accession NM_003503) is a VGAM1431 host target gene. CDC7L1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CDC7L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDC7L1 BINDING SITE, designated SEQ ID:9592, to the nucleotide sequence of VGAM1431 RNA, herein designated VGAM RNA, also designated SEQ ID:4142.

[49848] A function of VGAM1431 is therefore inhibition of CDC7 Cell Division Cycle 7-like 1 (*S. cerevisiae*) (CDC7L1, Accession NM_003503), a gene which may phosphorylate critical substrates that regulate the G1/S phase transition

and/or DNA replication in mammalian cells. Accordingly, utilities of VGAM1431 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDC7L1. The function of CDC7L1 has been established by previous studies. The Cdc7 protein kinase is essential for the G1/S transition and initiation of DNA replication during the cell division cycle in *S. cerevisiae*. Hsk1 is the *S. pombe* Cdc7 homolog. By searching EST databases for sequences similar to those of Cdc7 and Hsk1, Jiang and Hunter (1997) identified a partial CDC7L1 cDNA. They used the partial cDNA to isolate a full-length cDNA from a HeLa cell library. The predicted 574-amino acid human CDC7L1 protein contains the 11 conserved subdomains found in all protein serine/threonine kinases as well as 3 additional sequences (kinase inserts) between subdomains I and II, VII and VIII, and X and XI. The kinase domains of CDC7L1 and Cdc7 share 44% protein sequence identity. CDC7L1 has a molecular mass of 64 kD by SDS-PAGE. Using immunofluorescence, the authors demonstrated that CDC7L1 was predominantly localized in the nucleus. Immune complexes of epitope-tagged CDC7L1 from mammalian cell lysates phosphorylated histone H1 in vitro. Although the expression levels of CDC7L1 protein

appeared to be constant throughout the cell cycle, the protein kinase activity of CDC7L1 increased during S phase. Jiang and Hunter (1997) suggested that CDC7L1 may phosphorylate critical substrate(s) that regulate the G1/S phase transition and/or DNA replication in mammalian cells. Sato et al. (1997) isolated cDNAs encoding *Xenopus* and human Cdc7 homologs. Northern blot analysis revealed that CDC7L1 is expressed as 2.4-, 3.5-, and 4.4-kb mRNAs. The 3.5-kb transcript was detected in all tissues tested, while the 2.4-kb mRNA was testis-specific. Sato et al. (1997) determined that CDC7L1 phosphorylates the MCM2 (OMIM Ref. No. 116945) and MCM3 (OMIM Ref. No. 602693) proteins in vitro, suggesting that CDC7L1 may regulate DNA replication by modulating MCM functions. Using Northern blot and dot blot analyses, Hess et al. (1998) found that CDC7L1 was expressed in many normal tissues, but was overexpressed in all transformed cell lines tested and in certain tumor types.

[49849] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[49850] Jiang, W.; Hunter, T. : Identification and characterization of a human protein kinase related to budding yeast

Cdc7p. Proc. Nat. Acad. Sci. 94: 14320–14325, 1997. ;
and

[49851] Hess, G. F.; Drong, R. F.; Weiland, K. L.; Slightom, J. L.;
Sclafani, R. A.; Hollingsworth, R. E. : A human homolog of
the yeast CDC7 gene is overexpressed in some tumors
and transformed.

[49852] Further studies establishing the function and utilities of
CDC7L1 are found in John Hopkins OMIM database record
ID 603311, and in cited publications numbered
2447–2448, 528 and 5832 listed in the bibliography sec-
tion hereinbelow, which are also hereby incorporated by
reference. Chromosome 20 Open Reading Frame 30
(C20orf30, Accession NM_014145) is another VGAM1431
host target gene. C20orf30 BINDING SITE is HOST TARGET
binding site found in the 3` untranslated region of mRNA
encoded by C20orf30, corresponding to a HOST TARGET
binding site such as BINDING SITE I, BINDING SITE II or
BINDING SITE III. Table 2 illustrates the complementarity
of the nucleotide sequences of C20orf30 BINDING SITE,
designated SEQ ID:15429, to the nucleotide sequence of
VGAM1431 RNA, herein designated VGAM RNA, also des-
ignated SEQ ID:4142.

[49853] Another function of VGAM1431 is therefore inhibition of

Chromosome 20 Open Reading Frame 30 (C20orf30, Accession NM_014145). Accordingly, utilities of VGAM1431 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf30.

MGC12335 (Accession NM_032744) is another VGAM1431 host target gene. MGC12335 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC12335, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC12335 BINDING SITE, designated SEQ ID:26475, to the nucleotide sequence of VGAM1431 RNA, herein designated VGAM RNA, also designated SEQ ID:4142.

[49854] Another function of VGAM1431 is therefore inhibition of MGC12335 (Accession NM_032744). Accordingly, utilities of VGAM1431 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC12335. LOC92305 (Accession NM_138385) is another VGAM1431 host target gene. LOC92305 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92305, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92305 BINDING SITE, designated SEQ ID:28760, to the nucleotide sequence of VGAM1431 RNA, herein designated VGAM RNA, also designated SEQ ID:4142.

[49855] Another function of VGAM1431 is therefore inhibition of LOC92305 (Accession NM_138385). Accordingly, utilities of VGAM1431 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92305. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1432 (VGAM1432) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49856] VGAM1432 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1432 was detected is described hereinabove with reference to Figs. 1–8.

[49857] VGAM1432 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Potato Virus A. VGAM1432 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[49858] VGAM1432 gene encodes a VGAM1432 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1432 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1432 precursor RNA is designated SEQ ID:1418, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1418 is located at position 462 relative to the genome of Potato Virus A.

[49859] VGAM1432 precursor RNA folds onto itself, forming VGAM1432 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49860] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1432 folded precursor RNA into VGAM1432

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1432 RNA is designated SEQ ID:4143, and is provided hereinbelow with reference to the sequence listing part.

[49861] VGAM1432 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1432 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1432 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[49862] VGAM1432 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1432 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1432 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1432 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1432 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[49863] The complementary binding of VGAM1432 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1432 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1432 host target RNA into VGAM1432 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[49864] It is appreciated that VGAM1432 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1432 host target genes. The mRNA of each one of this plurality of VGAM1432 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1432 RNA, herein designated VGAM RNA, and which when bound by VGAM1432 RNA causes inhibition of translation of respective one or more VGAM1432 host target proteins.

[49865] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1432 gene, herein designated VGAM GENE, on one or more VGAM1432 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[49866] It is yet further appreciated that a function of VGAM1432 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1432 include diagnosis, prevention and treatment of viral infection by Potato Virus A. Specific functions, and accordingly utilities, of VGAM1432 correlate with, and may be deduced from, the identity of the host target genes which VGAM1432 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49867] Nucleotide sequences of the VGAM1432 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1432 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1432 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1432 are further described hereinbelow with reference to Table 1.

[49868] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1432 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1432 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49869] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1432 gene, herein designated VGAM is inhibition of expression of VGAM1432 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1432 correlate with, and may be deduced from, the identity of the target genes which VGAM1432 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[49870] Cell Division Cycle 42 (GTP binding protein, 25kDa) (CDC42, Accession NM_001791) is a VGAM1432 host target gene. CDC42 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CDC42, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDC42 BINDING SITE, designated SEQ ID:7541, to the nucleotide sequence of VGAM1432 RNA,

herein designated VGAM RNA, also designated SEQ ID:4143.

[49871] A function of VGAM1432 is therefore inhibition of Cell Division Cycle 42 (GTP binding protein, 25kDa) (CDC42, Accession NM_001791). Accordingly, utilities of VGAM1432 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDC42. Inositol Polyphosphate-5-phosphatase, 40kDa (INPP5A, Accession NM_005539) is another VGAM1432 host target gene. INPP5A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by INPP5A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of INPP5A BINDING SITE, designated SEQ ID:12065, to the nucleotide sequence of VGAM1432 RNA, herein designated VGAM RNA, also designated SEQ ID:4143.

[49872] Another function of VGAM1432 is therefore inhibition of Inositol Polyphosphate-5-phosphatase, 40kDa (INPP5A, Accession NM_005539), a gene which hydrolyzes the calcium-mobilizing second messenger $\text{ins}(1,4,5)\text{p3}$. Accordingly, utilities of VGAM1432 include diagnosis, prevention

and treatment of diseases and clinical conditions associated with INPP5A. The function of INPP5A and its association with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM1305. Kinesin Family Member 5C (KIF5C, Accession NM_004522) is another VGAM1432 host target gene. KIF5C BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIF5C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIF5C BINDING SITE, designated SEQ ID:10860, to the nucleotide sequence of VGAM1432 RNA, herein designated VGAM RNA, also designated SEQ ID:4143.

[49873] Another function of VGAM1432 is therefore inhibition of Kinesin Family Member 5C (KIF5C, Accession NM_004522). Accordingly, utilities of VGAM1432 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIF5C. Muscleblind-like (Drosophila) (MBNL, Accession NM_021038) is another VGAM1432 host target gene. MBNL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region

of mRNA encoded by MBNL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MBNL BINDING SITE, designated SEQ ID:22025, to the nucleotide sequence of VGAM1432 RNA, herein designated VGAM RNA, also designated SEQ ID:4143.

[49874] Another function of VGAM1432 is therefore inhibition of Muscleblind-like (Drosophila) (MBNL, Accession NM_021038), a gene which binds to cug triplet repeat expansion dsrna (by similarity). Accordingly, utilities of VGAM1432 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MBNL. The function of MBNL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM95.Requiem, Apoptosis Response Zinc Finger Gene (REQ, Accession NM_006268) is another VGAM1432 host target gene. REQ BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by REQ, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the

nucleotide sequences of REQ BINDING SITE, designated SEQ ID:12949, to the nucleotide sequence of VGAM1432 RNA, herein designated VGAM RNA, also designated SEQ ID:4143.

[49875] Another function of VGAM1432 is therefore inhibition of Requiem, Apoptosis Response Zinc Finger Gene (REQ, Accession NM_006268), a gene which is a putative zinc finger that is required for apoptosis in murine myeloid cell lines. Accordingly, utilities of VGAM1432 include diagnosis, prevention and treatment of diseases and clinical conditions associated with REQ. The function of REQ and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1224. SH3-domain Binding Protein 4 (SH3BP4, Accession NM_014521) is another VGAM1432 host target gene. SH3BP4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SH3BP4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SH3BP4 BINDING SITE, designated SEQ ID:15851, to the nucleotide sequence of VGAM1432 RNA, herein designated VGAM

RNA, also designated SEQ ID:4143.

[49876] Another function of VGAM1432 is therefore inhibition of SH3-domain Binding Protein 4 (SH3BP4, Accession NM_014521), a gene which is of unknown function, contains SH3-domain binding protein 4; similar to the EH-binding protein. Accordingly, utilities of VGAM1432 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SH3BP4. The function of SH3BP4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM179. Transducin (beta)-like 1X-linked (TBL1X, Accession NM_005647) is another VGAM1432 host target gene. TBL1X BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TBL1X, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TBL1X BINDING SITE, designated SEQ ID:12179, to the nucleotide sequence of VGAM1432 RNA, herein designated VGAM RNA, also designated SEQ ID:4143.

[49877] Another function of VGAM1432 is therefore inhibition of

Transducin (beta)-like 1X-linked (TBL1X, Accession NM_005647), a gene which activates latent HDAC3 activity. Accordingly, utilities of VGAM1432 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TBL1X. The function of TBL1X and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1151. Echinoderm Microtubule Associated Protein Like 4 (EML4, Accession NM_019063) is another VGAM1432 host target gene. EML4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EML4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EML4 BINDING SITE, designated SEQ ID:21142, to the nucleotide sequence of VGAM1432 RNA, herein designated VGAM RNA, also designated SEQ ID:4143.

[49878] Another function of VGAM1432 is therefore inhibition of Echinoderm Microtubule Associated Protein Like 4 (EML4, Accession NM_019063). Accordingly, utilities of VGAM1432 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EML4.

FLJ00007 (Accession XM_048928) is another VGAM1432 host target gene. FLJ00007 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ00007, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ00007 BINDING SITE, designated SEQ ID:35307, to the nucleotide sequence of VGAM1432 RNA, herein designated VGAM RNA, also designated SEQ ID:4143.

[49879] Another function of VGAM1432 is therefore inhibition of FLJ00007 (Accession XM_048928). Accordingly, utilities of VGAM1432 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00007. FLJ21302 (Accession NM_022901) is another VGAM1432 host target gene. FLJ21302 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21302, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21302 BINDING SITE, designated SEQ ID:23182, to the nucleotide sequence of VGAM1432 RNA, herein designated VGAM

RNA, also designated SEQ ID:4143.

[49880] Another function of VGAM1432 is therefore inhibition of FLJ21302 (Accession NM_022901). Accordingly, utilities of VGAM1432 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21302. FLJ22596 (Accession NM_025086) is another VGAM1432 host target gene. FLJ22596 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ22596, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22596 BINDING SITE, designated SEQ ID:24702, to the nucleotide sequence of VGAM1432 RNA, herein designated VGAM RNA, also designated SEQ ID:4143.

[49881] Another function of VGAM1432 is therefore inhibition of FLJ22596 (Accession NM_025086). Accordingly, utilities of VGAM1432 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22596. FLJ22625 (Accession NM_024715) is another VGAM1432 host target gene. FLJ22625 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ22625, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22625 BINDING SITE, designated SEQ ID:24041, to the nucleotide sequence of VGAM1432 RNA, herein designated VGAM RNA, also designated SEQ ID:4143.

[49882] Another function of VGAM1432 is therefore inhibition of FLJ22625 (Accession NM_024715). Accordingly, utilities of VGAM1432 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22625. FLJ23462 (Accession NM_024843) is another VGAM1432 host target gene. FLJ23462 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23462, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23462 BINDING SITE, designated SEQ ID:24261, to the nucleotide sequence of VGAM1432 RNA, herein designated VGAM RNA, also designated SEQ ID:4143.

[49883] Another function of VGAM1432 is therefore inhibition of FLJ23462 (Accession NM_024843). Accordingly, utilities of VGAM1432 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ23462. KIAA1879 (Accession XM_056635) is another VGAM1432 host target gene. KIAA1879 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1879, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1879 BINDING SITE, designated SEQ ID:36411, to the nucleotide sequence of VGAM1432 RNA, herein designated VGAM RNA, also designated SEQ ID:4143.

[49884] Another function of VGAM1432 is therefore inhibition of KIAA1879 (Accession XM_056635). Accordingly, utilities of VGAM1432 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1879. KOC1 (Accession XM_165847) is another VGAM1432 host target gene. KOC1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KOC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KOC1 BINDING SITE, designated SEQ ID:43778, to the nucleotide sequence of

VGAM1432 RNA, herein designated VGAM RNA, also designated SEQ ID:4143.

[49885] Another function of VGAM1432 is therefore inhibition of KOC1 (Accession XM_165847). Accordingly, utilities of VGAM1432 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KOC1. MYLE (Accession NM_014015) is another VGAM1432 host target gene. MYLE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MYLE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYLE BINDING SITE, designated SEQ ID:15234, to the nucleotide sequence of VGAM1432 RNA, herein designated VGAM RNA, also designated SEQ ID:4143.

[49886] Another function of VGAM1432 is therefore inhibition of MYLE (Accession NM_014015). Accordingly, utilities of VGAM1432 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYLE. RAB40B, Member RAS Oncogene Family (RAB40B, Accession NM_006822) is another VGAM1432 host target gene. RAB40B BINDING SITE is HOST TARGET binding site found

in the 3' untranslated region of mRNA encoded by RAB40B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB40B BINDING SITE, designated SEQ ID:13694, to the nucleotide sequence of VGAM1432 RNA, herein designated VGAM RNA, also designated SEQ ID:4143.

[49887] Another function of VGAM1432 is therefore inhibition of RAB40B, Member RAS Oncogene Family (RAB40B, Accession NM_006822). Accordingly, utilities of VGAM1432 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB40B. YKT6 (Accession NM_006555) is another VGAM1432 host target gene. YKT6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by YKT6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of YKT6 BINDING SITE, designated SEQ ID:13319, to the nucleotide sequence of VGAM1432 RNA, herein designated VGAM RNA, also designated SEQ ID:4143.

[49888] Another function of VGAM1432 is therefore inhibition of

YKT6 (Accession NM_006555). Accordingly, utilities of VGAM1432 include diagnosis, prevention and treatment of diseases and clinical conditions associated with YKT6. LOC122970 (Accession XM_058672) is another VGAM1432 host target gene. LOC122970 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC122970, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC122970 BINDING SITE, designated SEQ ID:36714, to the nucleotide sequence of VGAM1432 RNA, herein designated VGAM RNA, also designated SEQ ID:4143.

[49889] Another function of VGAM1432 is therefore inhibition of LOC122970 (Accession XM_058672). Accordingly, utilities of VGAM1432 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC122970. LOC149992 (Accession XM_086756) is another VGAM1432 host target gene. LOC149992 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149992, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC149992 BINDING SITE, designated SEQ ID:38842, to the nucleotide sequence of VGAM1432 RNA, herein designated VGAM RNA, also designated SEQ ID:4143.

[49890] Another function of VGAM1432 is therefore inhibition of LOC149992 (Accession XM_086756). Accordingly, utilities of VGAM1432 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149992. LOC153339 (Accession XM_098362) is another VGAM1432 host target gene. LOC153339 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC153339, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153339 BINDING SITE, designated SEQ ID:41613, to the nucleotide sequence of VGAM1432 RNA, herein designated VGAM RNA, also designated SEQ ID:4143.

[49891] Another function of VGAM1432 is therefore inhibition of LOC153339 (Accession XM_098362). Accordingly, utilities of VGAM1432 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153339. LOC153910 (Accession XM_087801) is an-

other VGAM1432 host target gene. LOC153910 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153910, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153910 BINDING SITE, designated SEQ ID:39438, to the nucleotide sequence of VGAM1432 RNA, herein designated VGAM RNA, also designated SEQ ID:4143.

[49892] Another function of VGAM1432 is therefore inhibition of LOC153910 (Accession XM_087801). Accordingly, utilities of VGAM1432 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153910. LOC196955 (Accession XM_085210) is another VGAM1432 host target gene. LOC196955 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196955, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196955 BINDING SITE, designated SEQ ID:37932, to the nucleotide sequence of VGAM1432 RNA, herein designated VGAM RNA, also designated SEQ ID:4143.

[49893] Another function of VGAM1432 is therefore inhibition of LOC196955 (Accession XM_085210). Accordingly, utilities of VGAM1432 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196955. LOC202347 (Accession XM_117390) is another VGAM1432 host target gene. LOC202347 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC202347, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202347 BINDING SITE, designated SEQ ID:43430, to the nucleotide sequence of VGAM1432 RNA, herein designated VGAM RNA, also designated SEQ ID:4143.

[49894] Another function of VGAM1432 is therefore inhibition of LOC202347 (Accession XM_117390). Accordingly, utilities of VGAM1432 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202347. LOC219401 (Accession XM_166706) is another VGAM1432 host target gene. LOC219401 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219401, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219401 BINDING SITE, designated SEQ ID:44590, to the nucleotide sequence of VGAM1432 RNA, herein designated VGAM RNA, also designated SEQ ID:4143.

[49895] Another function of VGAM1432 is therefore inhibition of LOC219401 (Accession XM_166706). Accordingly, utilities of VGAM1432 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219401. LOC255012 (Accession XM_171369) is another VGAM1432 host target gene. LOC255012 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255012, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255012 BINDING SITE, designated SEQ ID:46043, to the nucleotide sequence of VGAM1432 RNA, herein designated VGAM RNA, also designated SEQ ID:4143.

[49896] Another function of VGAM1432 is therefore inhibition of LOC255012 (Accession XM_171369). Accordingly, utilities of VGAM1432 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC255012. LOC255096 (Accession XM_174913) is another VGAM1432 host target gene. LOC255096 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255096, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255096 BINDING SITE, designated SEQ ID:46606, to the nucleotide sequence of VGAM1432 RNA, herein designated VGAM RNA, also designated SEQ ID:4143.

[49897] Another function of VGAM1432 is therefore inhibition of LOC255096 (Accession XM_174913). Accordingly, utilities of VGAM1432 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255096. LOC90309 (Accession XM_030830) is another VGAM1432 host target gene. LOC90309 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90309, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90309 BINDING SITE, designated SEQ ID:31150, to the nucleotide sequence of VGAM1432 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4143.

[49898] Another function of VGAM1432 is therefore inhibition of LOC90309 (Accession XM_030830). Accordingly, utilities of VGAM1432 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90309. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1433 (VGAM1433) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49899] VGAM1433 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1433 was detected is described hereinabove with reference to Figs. 1–8.

[49900] VGAM1433 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Potato Virus A. VGAM1433 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49901] VGAM1433 gene encodes a VGAM1433 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM1433 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1433 precursor RNA is designated SEQ ID:1419, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1419 is located at position 3612 relative to the genome of Potato Virus A.

[49902] VGAM1433 precursor RNA folds onto itself, forming VGAM1433 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49903] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1433 folded precursor RNA into VGAM1433 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 56%) nucleotide sequence of VGAM1433 RNA is designated SEQ ID:4144, and is provided hereinbelow with reference to the sequence listing part.

[49904] VGAM1433 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1433 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1433 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[49905] VGAM1433 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1433 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1433 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1433 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1433 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[49906] The complementary binding of VGAM1433 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1433 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1433 host target RNA into VGAM1433 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49907] It is appreciated that VGAM1433 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1433 host target genes. The mRNA of

each one of this plurality of VGAM1433 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1433 RNA, herein designated VGAM RNA, and which when bound by VGAM1433 RNA causes inhibition of translation of respective one or more VGAM1433 host target proteins.

[49908] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1433 gene, herein designated VGAM GENE, on one or more VGAM1433 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[49909] It is yet further appreciated that a function of VGAM1433 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1433 include diagnosis, prevention and treatment of viral infection by Potato Virus A. Specific functions, and accordingly utilities, of VGAM1433 correlate with, and may be deduced from, the identity of the host target genes which VGAM1433 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49910] Nucleotide sequences of the VGAM1433 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1433 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1433 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1433 are further described hereinbelow with reference to Table 1.

[49911] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1433 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1433 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49912] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1433 gene, herein designated VGAM is inhibition of expression of VGAM1433 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1433 correlate with, and may be deduced from, the identity of the target genes which VGAM1433 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[49913] B-cell CLL/lymphoma 2 (BCL2, Accession NM_000633) is a VGAM1433 host target gene. BCL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BCL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL2 BINDING SITE, designated SEQ ID:6264, to the nucleotide sequence of VGAM1433 RNA, herein designated VGAM RNA, also designated SEQ ID:4144.

[49914] A function of VGAM1433 is therefore inhibition of B-cell CLL/lymphoma 2 (BCL2, Accession NM_000633). Accordingly, utilities of VGAM1433 include diagnosis, prevention

and treatment of diseases and clinical conditions associated with BCL2. Norrie Disease (pseudoglioma) (NDP, Accession NM_000266) is another VGAM1433 host target gene. NDP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NDP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NDP BINDING SITE, designated SEQ ID:5806, to the nucleotide sequence of VGAM1433 RNA, herein designated VGAM RNA, also designated SEQ ID:4144.

[49915] Another function of VGAM1433 is therefore inhibition of Norrie Disease (pseudoglioma) (NDP, Accession NM_000266), a gene which may be involved in a pathway that regulates neural cell differentiation and proliferation. Accordingly, utilities of VGAM1433 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NDP. The function of NDP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM113. Regulatory Factor X, 5 (influences HLA class II expression) (RFX5, Accession NM_000449) is another VGAM1433 host target gene.

RFX5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RFX5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RFX5 BINDING SITE, designated SEQ ID:6050, to the nucleotide sequence of VGAM1433 RNA, herein designated VGAM RNA, also designated SEQ ID:4144.

[49916] Another function of VGAM1433 is therefore inhibition of Regulatory Factor X, 5 (influences HLA class II expression) (RFX5, Accession NM_000449), a gene which activates transcription from class ii mhc promoters. Accordingly, utilities of VGAM1433 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RFX5. The function of RFX5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM55.FLJ21148 (Accession NM_024860) is another VGAM1433 host target gene. FLJ21148 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21148, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of FLJ21148 BINDING SITE, designated SEQ ID:24293, to the nucleotide sequence of VGAM1433 RNA, herein designated VGAM RNA, also designated SEQ ID:4144.

[49917] Another function of VGAM1433 is therefore inhibition of FLJ21148 (Accession NM_024860). Accordingly, utilities of VGAM1433 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21148. KIAA1671 (Accession XM_037809) is another VGAM1433 host target gene. KIAA1671 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1671, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1671 BINDING SITE, designated SEQ ID:32691, to the nucleotide sequence of VGAM1433 RNA, herein designated VGAM RNA, also designated SEQ ID:4144.

[49918] Another function of VGAM1433 is therefore inhibition of KIAA1671 (Accession XM_037809). Accordingly, utilities of VGAM1433 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1671. KIAA1678 (Accession XM_051221) is another

VGAM1433 host target gene. KIAA1678 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1678, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1678 BINDING SITE, designated SEQ ID:35789, to the nucleotide sequence of VGAM1433 RNA, herein designated VGAM RNA, also designated SEQ ID:4144.

[49919] Another function of VGAM1433 is therefore inhibition of KIAA1678 (Accession XM_051221). Accordingly, utilities of VGAM1433 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1678. MGC2562 (Accession NM_032374) is another VGAM1433 host target gene. MGC2562 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC2562, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2562 BINDING SITE, designated SEQ ID:26165, to the nucleotide sequence of VGAM1433 RNA, herein designated VGAM RNA, also designated SEQ ID:4144.

[49920] Another function of VGAM1433 is therefore inhibition of MGC2562 (Accession NM_032374). Accordingly, utilities of VGAM1433 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2562. NYD-SP25 (Accession NM_033516) is another VGAM1433 host target gene. NYD-SP25 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NYD-SP25, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NYD-SP25 BINDING SITE, designated SEQ ID:27293, to the nucleotide sequence of VGAM1433 RNA, herein designated VGAM RNA, also designated SEQ ID:4144.

[49921] Another function of VGAM1433 is therefore inhibition of NYD-SP25 (Accession NM_033516). Accordingly, utilities of VGAM1433 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NYD-SP25. Oxysterol Binding Protein-like 3 (OSBPL3, Accession NM_015550) is another VGAM1433 host target gene. OSBPL3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OSBPL3, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OSBPL3 BINDING SITE, designated SEQ ID:17814, to the nucleotide sequence of VGAM1433 RNA, herein designated VGAM RNA, also designated SEQ ID:4144.

[49922] Another function of VGAM1433 is therefore inhibition of Oxysterol Binding Protein-like 3 (OSBPL3, Accession NM_015550). Accordingly, utilities of VGAM1433 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBPL3. PRO2958 (Accession NM_018546) is another VGAM1433 host target gene. PRO2958 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRO2958, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2958 BINDING SITE, designated SEQ ID:20627, to the nucleotide sequence of VGAM1433 RNA, herein designated VGAM RNA, also designated SEQ ID:4144.

[49923] Another function of VGAM1433 is therefore inhibition of PRO2958 (Accession NM_018546). Accordingly, utilities of

VGAM1433 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2958. Retinoic Acid Induced 17 (RAI17, Accession XM_166091) is another VGAM1433 host target gene. RAI17 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RAI17, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAI17 BINDING SITE, designated SEQ ID:43858, to the nucleotide sequence of VGAM1433 RNA, herein designated VGAM RNA, also designated SEQ ID:4144.

[49924] Another function of VGAM1433 is therefore inhibition of Retinoic Acid Induced 17 (RAI17, Accession XM_166091). Accordingly, utilities of VGAM1433 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAI17. LOC145508 (Accession XM_085158) is another VGAM1433 host target gene. LOC145508 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC145508, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of LOC145508 BINDING SITE, designated SEQ ID:37888, to the nucleotide sequence of VGAM1433 RNA, herein designated VGAM RNA, also designated SEQ ID:4144.

[49925] Another function of VGAM1433 is therefore inhibition of LOC145508 (Accession XM_085158). Accordingly, utilities of VGAM1433 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145508. LOC149566 (Accession XM_097670) is another VGAM1433 host target gene. LOC149566 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149566, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149566 BINDING SITE, designated SEQ ID:41017, to the nucleotide sequence of VGAM1433 RNA, herein designated VGAM RNA, also designated SEQ ID:4144.

[49926] Another function of VGAM1433 is therefore inhibition of LOC149566 (Accession XM_097670). Accordingly, utilities of VGAM1433 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149566. LOC253639 (Accession XM_171060) is an-

other VGAM1433 host target gene. LOC253639 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253639, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253639 BINDING SITE, designated SEQ ID:45856, to the nucleotide sequence of VGAM1433 RNA, herein designated VGAM RNA, also designated SEQ ID:4144.

[49927] Another function of VGAM1433 is therefore inhibition of LOC253639 (Accession XM_171060). Accordingly, utilities of VGAM1433 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253639. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1434 (VGAM1434) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49928] VGAM1434 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1434 was detected is de-

scribed hereinabove with reference to Figs. 1–8.

[49929] VGAM1434 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Potato Virus A.

VGAM1434 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49930] VGAM1434 gene encodes a VGAM1434 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1434 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1434 precursor RNA is designated SEQ ID:1420, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1420 is located at position 3882 relative to the genome of Potato Virus A.

[49931] VGAM1434 precursor RNA folds onto itself, forming VGAM1434 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA

gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49932] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1434 folded precursor RNA into VGAM1434 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1434 RNA is designated SEQ ID:4145, and is provided hereinbelow with reference to the sequence listing part.

[49933] VGAM1434 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1434 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1434 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[49934] VGAM1434 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1434 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1434 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1434 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1434 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[49935] The complementary binding of VGAM1434 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1434 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1434 host target RNA into VGAM1434 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49936] It is appreciated that VGAM1434 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1434 host target genes. The mRNA of each one of this plurality of VGAM1434 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1434 RNA, herein designated VGAM RNA, and which when bound by VGAM1434 RNA causes inhibition of translation of respective one or more VGAM1434 host target proteins.

[49937] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1434 gene, herein designated VGAM GENE, on one or more VGAM1434 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[49938] It is yet further appreciated that a function of VGAM1434 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1434 include diagnosis, prevention and treatment of viral infection by Potato Virus A. Specific functions, and accordingly utilities, of VGAM1434 correlate with, and may be deduced from, the identity of the host target genes which VGAM1434 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49939] Nucleotide sequences of the VGAM1434 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1434 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM1434 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1434 are further described hereinbelow with reference to Table 1.

[49940] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1434 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1434 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49941] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1434 gene, herein designated VGAM is inhibition of expression of VGAM1434 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1434 correlate with, and may be deduced from, the identity of the target genes which VGAM1434 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[49942] C-type (calcium dependent, carbohydrate-recognition domain) Lectin, Superfamily Member 5 (CLECSF5, Accession NM_013252) is a VGAM1434 host target gene. CLECSF5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLECSF5,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLECSF5 BINDING SITE, designated SEQ ID:14916, to the nucleotide sequence of VGAM1434 RNA, herein designated VGAM RNA, also designated SEQ ID:4145.

[49943] A function of VGAM1434 is therefore inhibition of C-type (calcium dependent, carbohydrate-recognition domain) Lectin, Superfamily Member 5 (CLECSF5, Accession NM_013252). Accordingly, utilities of VGAM1434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLECSF5. Usher Syndrome 3A (USH3A, Accession NM_052995) is another VGAM1434 host target gene. USH3A BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by USH3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of USH3A BINDING SITE, designated SEQ ID:27563, to the nucleotide sequence of VGAM1434 RNA, herein designated VGAM RNA, also designated SEQ ID:4145.

[49944] Another function of VGAM1434 is therefore inhibition of Usher Syndrome 3A (USH3A, Accession NM_052995). Accordingly, utilities of VGAM1434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with USH3A. FLJ10846 (Accession NM_018241) is another VGAM1434 host target gene. FLJ10846 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ10846, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10846 BINDING SITE, designated SEQ ID:20197, to the nucleotide sequence of VGAM1434 RNA, herein designated VGAM RNA, also designated SEQ ID:4145.

[49945] Another function of VGAM1434 is therefore inhibition of FLJ10846 (Accession NM_018241). Accordingly, utilities of VGAM1434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10846. Mitochondrial Ribosomal Protein S35 (MRPS35, Accession NM_021821) is another VGAM1434 host target gene. MRPS35 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MRPS35, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MRPS35 BINDING SITE, designated SEQ ID:22400, to the nucleotide sequence of VGAM1434 RNA, herein designated VGAM RNA, also designated SEQ ID:4145.

[49946] Another function of VGAM1434 is therefore inhibition of Mitochondrial Ribosomal Protein S35 (MRPS35, Accession NM_021821). Accordingly, utilities of VGAM1434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPS35. Sema Domain, Immunoglobulin Domain (Ig), Transmembrane Domain (TM) and Short Cytoplasmic Domain, (semaphorin) 4F (SEMA4F, Accession NM_004263) is another VGAM1434 host target gene. SEMA4F BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEMA4F, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEMA4F BINDING SITE, designated SEQ ID:10459, to the nucleotide sequence of VGAM1434 RNA, herein designated VGAM RNA, also designated SEQ ID:4145.

[49947] Another function of VGAM1434 is therefore inhibition of Sema Domain, Immunoglobulin Domain (Ig), Transmembrane Domain (TM) and Short Cytoplasmic Domain, (semaphorin) 4F (SEMA4F, Accession NM_004263). Accordingly, utilities of VGAM1434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEMA4F. LOC90120 (Accession XM_029168) is another VGAM1434 host target gene. LOC90120 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90120, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90120 BINDING SITE, designated SEQ ID:30851, to the nucleotide sequence of VGAM1434 RNA, herein designated VGAM RNA, also designated SEQ ID:4145.

[49948] Another function of VGAM1434 is therefore inhibition of LOC90120 (Accession XM_029168). Accordingly, utilities of VGAM1434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90120. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 1435 (VGAM1435) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49949] VGAM1435 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1435 was detected is described hereinabove with reference to Figs. 1–8.

[49950] VGAM1435 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Potato Virus A. VGAM1435 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49951] VGAM1435 gene encodes a VGAM1435 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1435 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1435 precursor RNA is designated SEQ ID:1421, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1421 is located at position 7490 relative to the

genome of Potato Virus A.

[49952] VGAM1435 precursor RNA folds onto itself, forming VGAM1435 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49953] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1435 folded precursor RNA into VGAM1435 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1435 RNA is designated SEQ ID:4146, and is provided hereinbelow with reference to the sequence listing part.

[49954] VGAM1435 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1435 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1435 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[49955] VGAM1435 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1435 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1435 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1435 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1435 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[49956] The complementary binding of VGAM1435 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1435 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1435 host target RNA into VGAM1435 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[49957] It is appreciated that VGAM1435 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1435 host target genes. The mRNA of each one of this plurality of VGAM1435 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1435 RNA, herein designated VGAM RNA, and which when bound by VGAM1435 RNA causes inhibition of translation of respective one or more VGAM1435 host target proteins.

[49958] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1435 gene, herein designated VGAM GENE, on one or more VGAM1435 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[49959] It is yet further appreciated that a function of VGAM1435 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1435 include diagnosis, prevention and treatment of viral infection by Potato Virus A. Specific functions, and accordingly utilities, of VGAM1435 corre-

late with, and may be deduced from, the identity of the host target genes which VGAM1435 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49960] Nucleotide sequences of the VGAM1435 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1435 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1435 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1435 are further described hereinbelow with reference to Table 1.

[49961] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1435 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1435 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49962] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1435 gene, herein designated VGAM is inhibition of expression of VGAM1435 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1435 correlate with, and may be deduced

from, the identity of the target genes which VGAM1435 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[49963] DNA Fragmentation Factor, 40kDa, Beta Polypeptide (caspase-activated DNase) (DFFB, Accession XM_113366) is a VGAM1435 host target gene. DFFB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DFFB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DFFB BINDING SITE, designated SEQ ID:42237, to the nucleotide sequence of VGAM1435 RNA, herein designated VGAM RNA, also designated SEQ ID:4146.

[49964] A function of VGAM1435 is therefore inhibition of DNA Fragmentation Factor, 40kDa, Beta Polypeptide (caspase-activated DNase) (DFFB, Accession XM_113366), a gene which induces DNA fragmentation and chromatin condensation during apoptosis. Accordingly, utilities of VGAM1435 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DFFB. The function of DFFB and its association with various diseases and clinical conditions, has been established by

previous studies, as described hereinabove with reference to VGAM74. Endothelin 3 (EDN3, Accession NM_000114) is another VGAM1435 host target gene. EDN3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by EDN3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EDN3 BINDING SITE, designated SEQ ID:5581, to the nucleotide sequence of VGAM1435 RNA, herein designated VGAM RNA, also designated SEQ ID:4146.

[49965] Another function of VGAM1435 is therefore inhibition of Endothelin 3 (EDN3, Accession NM_000114). Accordingly, utilities of VGAM1435 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EDN3. Butyrophilin, Subfamily 1, Member A1 (BTN1A1, Accession NM_001732) is another VGAM1435 host target gene. BTN1A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BTN1A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BTN1A1 BINDING SITE,

designated SEQ ID:7469, to the nucleotide sequence of VGAM1435 RNA, herein designated VGAM RNA, also designated SEQ ID:4146.

[49966] Another function of VGAM1435 is therefore inhibition of Butyrophilin, Subfamily 1, Member A1 (BTN1A1, Accession NM_001732). Accordingly, utilities of VGAM1435 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BTN1A1. KIAA0121 (Accession XM_052386) is another VGAM1435 host target gene. KIAA0121 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0121, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0121 BINDING SITE, designated SEQ ID:35965, to the nucleotide sequence of VGAM1435 RNA, herein designated VGAM RNA, also designated SEQ ID:4146.

[49967] Another function of VGAM1435 is therefore inhibition of KIAA0121 (Accession XM_052386). Accordingly, utilities of VGAM1435 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0121. MGC3265 (Accession NM_024028) is another

VGAM1435 host target gene. MGC3265 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC3265, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC3265 BINDING SITE, designated SEQ ID:23457, to the nucleotide sequence of VGAM1435 RNA, herein designated VGAM RNA, also designated SEQ ID:4146.

[49968] Another function of VGAM1435 is therefore inhibition of MGC3265 (Accession NM_024028). Accordingly, utilities of VGAM1435 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC3265. Ubinuclein 1 (UBN1, Accession NM_016936) is another VGAM1435 host target gene. UBN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UBN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBN1 BINDING SITE, designated SEQ ID:18852, to the nucleotide sequence of VGAM1435 RNA, herein designated VGAM RNA, also designated SEQ ID:4146.

[49969] Another function of VGAM1435 is therefore inhibition of Ubinuclein 1 (UBN1, Accession NM_016936). Accordingly, utilities of VGAM1435 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBN1. LOC146723 (Accession XM_085565) is another VGAM1435 host target gene. LOC146723 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146723, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146723 BINDING SITE, designated SEQ ID:38227, to the nucleotide sequence of VGAM1435 RNA, herein designated VGAM RNA, also designated SEQ ID:4146.

[49970] Another function of VGAM1435 is therefore inhibition of LOC146723 (Accession XM_085565). Accordingly, utilities of VGAM1435 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146723. LOC158158 (Accession XM_088494) is another VGAM1435 host target gene. LOC158158 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158158, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158158 BINDING SITE, designated SEQ ID:39732, to the nucleotide sequence of VGAM1435 RNA, herein designated VGAM RNA, also designated SEQ ID:4146.

[49971] Another function of VGAM1435 is therefore inhibition of LOC158158 (Accession XM_088494). Accordingly, utilities of VGAM1435 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158158. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1436 (VGAM1436) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49972] VGAM1436 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1436 was detected is described hereinabove with reference to Figs. 1-8.

[49973] VGAM1436 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Potato Virus A. VGAM1436 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[49974] VGAM1436 gene encodes a VGAM1436 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1436 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1436 precursor RNA is designated SEQ ID:1422, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1422 is located at position 6614 relative to the genome of Potato Virus A.

[49975] VGAM1436 precursor RNA folds onto itself, forming VGAM1436 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49976] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1436 folded precursor RNA into VGAM1436

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 53%) nucleotide sequence of VGAM1436 RNA is designated SEQ ID:4147, and is provided hereinbelow with reference to the sequence listing part.

[49977] VGAM1436 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1436 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1436 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[49978] VGAM1436 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1436 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1436 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1436 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1436 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[49979] The complementary binding of VGAM1436 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1436 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1436 host target RNA into VGAM1436 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[49980] It is appreciated that VGAM1436 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1436 host target genes. The mRNA of each one of this plurality of VGAM1436 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1436 RNA, herein designated VGAM RNA, and which when bound by VGAM1436 RNA causes inhibition of translation of respective one or more VGAM1436 host target proteins.

[49981] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1436 gene, herein designated VGAM GENE, on one or more VGAM1436 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[49982] It is yet further appreciated that a function of VGAM1436 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1436 include diagnosis, prevention and treatment of viral infection by Potato Virus A. Specific functions, and accordingly utilities, of VGAM1436 correlate with, and may be deduced from, the identity of the host target genes which VGAM1436 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[49983] Nucleotide sequences of the VGAM1436 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1436 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1436 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1436 are further described hereinbelow with reference to Table 1.

[49984] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1436 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1436 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[49985] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1436 gene, herein designated VGAM is inhibition of expression of VGAM1436 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1436 correlate with, and may be deduced from, the identity of the target genes which VGAM1436 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[49986] Human Immunodeficiency Virus Type I Enhancer Binding Protein 2 (HIVEP2, Accession NM_006734) is a VGAM1436 host target gene. HIVEP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HIVEP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HIVEP2 BINDING SITE, designated SEQ ID:13586, to the nucleotide sequence of

VGAM1436 RNA, herein designated VGAM RNA, also designated SEQ ID:4147.

[49987] A function of VGAM1436 is therefore inhibition of Human Immunodeficiency Virus Type I Enhancer Binding Protein 2 (HIVEP2, Accession NM_006734). Accordingly, utilities of VGAM1436 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HIVEP2. Synaptotagmin I (SYT1, Accession NM_005639) is another VGAM1436 host target gene. SYT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SYT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYT1 BINDING SITE, designated SEQ ID:12167, to the nucleotide sequence of VGAM1436 RNA, herein designated VGAM RNA, also designated SEQ ID:4147.

[49988] Another function of VGAM1436 is therefore inhibition of Synaptotagmin I (SYT1, Accession NM_005639), a gene which may have a regulatory role in the membrane interactions during trafficking of synaptic vesicles at the active zone of the synapse. Accordingly, utilities of VGAM1436 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with SYT1. The function of SYT1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM739. Zinc Finger Protein 278 (ZNF278, Accession NM_014323) is another VGAM1436 host target gene. ZNF278 BINDING SITE1 through ZNF278 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ZNF278, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF278 BINDING SITE1 through ZNF278 BINDING SITE3, designated SEQ ID:15626, SEQ ID:25775 and SEQ ID:25785 respectively, to the nucleotide sequence of VGAM1436 RNA, herein designated VGAM RNA, also designated SEQ ID:4147.

[49989] Another function of VGAM1436 is therefore inhibition of Zinc Finger Protein 278 (ZNF278, Accession NM_014323), a gene which represses basal transcription as well as RNF4-mediated activation. Accordingly, utilities of VGAM1436 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF278. The function of ZNF278 and its association with

various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM414. Synovial Sarcoma Translocation Gene On Chromosome 18-like 1 (SS18L1, Accession XM_037202) is another VGAM1436 host target gene. SS18L1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SS18L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SS18L1 BINDING SITE, designated SEQ ID:32556, to the nucleotide sequence of VGAM1436 RNA, herein designated VGAM RNA, also designated SEQ ID:4147.

[49990] Another function of VGAM1436 is therefore inhibition of Synovial Sarcoma Translocation Gene On Chromosome 18-like 1 (SS18L1, Accession XM_037202). Accordingly, utilities of VGAM1436 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SS18L1. LOC145815 (Accession XM_096874) is another VGAM1436 host target gene. LOC145815 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145815, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145815 BINDING SITE, designated SEQ ID:40602, to the nucleotide sequence of VGAM1436 RNA, herein designated VGAM RNA, also designated SEQ ID:4147.

[49991] Another function of VGAM1436 is therefore inhibition of LOC145815 (Accession XM_096874). Accordingly, utilities of VGAM1436 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145815. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1437 (VGAM1437) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[49992] VGAM1437 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1437 was detected is described hereinabove with reference to Figs. 1-8.

[49993] VGAM1437 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Potato Virus A.

VGAM1437 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[49994] VGAM1437 gene encodes a VGAM1437 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1437 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1437 precursor RNA is designated SEQ ID:1423, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1423 is located at position 26 relative to the genome of Potato Virus A.

[49995] VGAM1437 precursor RNA folds onto itself, forming VGAM1437 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[49996] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM1437 folded precursor RNA into VGAM1437 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of VGAM1437 RNA is designated SEQ ID:4148, and is provided hereinbelow with reference to the sequence listing part.

[49997] VGAM1437 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1437 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1437 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[49998] VGAM1437 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1437 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1437 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1437 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1437 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[49999] The complementary binding of VGAM1437 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1437 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1437 host target RNA into VGAM1437 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50000] It is appreciated that VGAM1437 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1437 host target genes. The mRNA of each one of this plurality of VGAM1437 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1437 RNA, herein designated VGAM RNA, and which when bound by VGAM1437 RNA causes inhibition of translation of respective one or more VGAM1437 host target proteins.

[50001] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1437 gene, herein designated VGAM GENE, on one or more VGAM1437 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[50002] It is yet further appreciated that a function of VGAM1437 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1437 include diagnosis, prevention and treatment of viral infection by Potato Virus A. Specific functions, and accordingly utilities, of VGAM1437 correlate with, and may be deduced from, the identity of the host target genes which VGAM1437 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50003] Nucleotide sequences of the VGAM1437 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1437 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1437 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1437 are further described hereinbelow with reference to Table 1.

[50004] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1437 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1437 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50005] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1437 gene, herein designated VGAM is inhibition of expression of VGAM1437 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1437 correlate with, and may be deduced from, the identity of the target genes which VGAM1437 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[50006] Deoxyribonuclease I-like 1 (DNASE1L1, Accession NM_006730) is a VGAM1437 host target gene. DNASE1L1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DNASE1L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DNASE1L1 BINDING SITE, designated SEQ

ID:13568, to the nucleotide sequence of VGAM1437 RNA, herein designated VGAM RNA, also designated SEQ ID:4148.

[50007] A function of VGAM1437 is therefore inhibition of Deoxyribonuclease I-like 1 (DNASE1L1, Accession NM_006730), a gene which seems to be involved in cell death. Accordingly, utilities of VGAM1437 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNASE1L1. The function of DNASE1L1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM885.Solute Carrier Family 6 (neurotransmitter transporter, taurine), Member 6 (SLC6A6, Accession NM_003043) is another VGAM1437 host target gene. SLC6A6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC6A6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC6A6 BINDING SITE, designated SEQ ID:9002, to the nucleotide sequence of VGAM1437 RNA, herein designated VGAM RNA, also designated SEQ

ID:4148.

[50008] Another function of VGAM1437 is therefore inhibition of Solute Carrier Family 6 (neurotransmitter transporter, taurine), Member 6 (SLC6A6, Accession NM_003043), a gene which transports taurine and other beta-amino acids like beta-alanine. Accordingly, utilities of VGAM1437 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC6A6. The function of SLC6A6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM36. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1438 (VGAM1438) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50009] VGAM1438 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1438 was detected is described hereinabove with reference to Figs. 1–8.

[50010] VGAM1438 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bean Common Mosaic

Necrosis Virus. VGAM1438 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50011] VGAM1438 gene encodes a VGAM1438 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1438 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1438 precursor RNA is designated SEQ ID:1424, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1424 is located at position 7374 relative to the genome of Bean Common Mosaic Necrosis Virus.

[50012] VGAM1438 precursor RNA folds onto itself, forming VGAM1438 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50013] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM1438 folded precursor RNA into VGAM1438 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM1438 RNA is designated SEQ ID:4149, and is provided hereinbelow with reference to the sequence listing part.

[50014] VGAM1438 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1438 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1438 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[50015] VGAM1438 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1438 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1438 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1438 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1438 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[50016] The complementary binding of VGAM1438 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1438 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1438 host target RNA into VGAM1438 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50017] It is appreciated that VGAM1438 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1438 host target genes. The mRNA of each one of this plurality of VGAM1438 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1438 RNA, herein designated VGAM RNA, and which when bound by VGAM1438 RNA causes inhibition of translation of respective one or more VGAM1438 host target proteins.

[50018] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1438 gene, herein designated VGAM GENE, on one or more VGAM1438 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[50019] It is yet further appreciated that a function of VGAM1438 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1438 include diagnosis, prevention and treatment of viral infection by Bean Common Mosaic Necrosis Virus. Specific functions, and accordingly utilities, of VGAM1438 correlate with, and may be deduced from, the identity of the host target genes which VGAM1438 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50020] Nucleotide sequences of the VGAM1438 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1438 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1438 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1438 are further described hereinbelow with reference to Table 1.

[50021] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1438 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1438 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50022] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1438 gene, herein designated VGAM is inhibition of expression of VGAM1438 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1438 correlate with, and may be deduced from, the identity of the target genes which VGAM1438 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[50023] Cockayne Syndrome 1 (classical) (CKN1, Accession NM_000082) is a VGAM1438 host target gene. CKN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CKN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CKN1 BINDING SITE, designated SEQ ID:5532, to the nu-

cleotide sequence of VGAM1438 RNA, herein designated VGAM RNA, also designated SEQ ID:4149.

[50024] A function of VGAM1438 is therefore inhibition of Cockayne Syndrome 1 (classical) (CKN1, Accession NM_000082). Accordingly, utilities of VGAM1438 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CKN1. GCN1 General Control of Amino-acid Synthesis 1-like 1 (yeast) (GCN1L1, Accession XM_045792) is another VGAM1438 host target gene. GCN1L1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GCN1L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GCN1L1 BINDING SITE, designated SEQ ID:34567, to the nucleotide sequence of VGAM1438 RNA, herein designated VGAM RNA, also designated SEQ ID:4149.

[50025] Another function of VGAM1438 is therefore inhibition of GCN1 General Control of Amino-acid Synthesis 1-like 1 (yeast) (GCN1L1, Accession XM_045792), a gene which performs an EF3-related function on the ribosome by regulating GCN2 kinase activity. Accordingly, utilities of

VGAM1438 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GCN1L1. The function of GCN1L1 has been established by previous studies. In *S. cerevisiae*, amino acid starvation causes increased transcription of genes encoding enzymes involved in amino acid biosynthesis. This process, known as general amino acid control, requires the phosphorylation of translation initiation factor eIF2 (see OMIM Ref. No. 603907) by protein kinase GCN2 and subsequent derepression of GCN4, a transcriptional activator that binds to the promoter of genes subject to the general control. Two other proteins, GCN1 and GCN20, are required for the activation of GCN2. Working with yeast GCN proteins, Marton et al. (1997) found that despite the presence of multiple hydrophobic regions indicating a putative transmembrane domain, GCN1 is located throughout the cytoplasm. The N-terminal region of GCN20 interacts with an internal segment of GCN1 that shows sequence similarity to translation elongation factor EF3 (see OMIM Ref. No. 603917). Both GCN1 and GCN20 stably interact with translating 80S ribosomes. Whereas GCN1 could bind to ribosomes independently of GCN20, its functions on polysomes were largely dependent on the ATP-binding

cassette of GCN20. By EST database searching for sequences related to GCN1, Marton et al. (1997) identified partial cDNAs of human GCN1L1. The portion of GCN1L1 that is highly conserved with yeast GCN1 also shows sequence similarity to yeast EF3. This conserved domain supports the hypothesis that GCN1L1 performs an EF3-related function on the ribosome by regulating GCN2 kinase activity.

[50026] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[50027] Marton, M. J.; Vazquez de Aldana, C. R.; Qiu, H.; Chakraborty, K.; Hinnebusch, A. G. : Evidence that GCN1 and GCN20, translational regulators of GCN4, function on elongating ribosomes in activation of eIF2- α kinase GCN2. *Molec. Cell. Biol.* 17: 4474-4489, 1997. ; and

[50028] Nagase, T.; Seki, N.; Ishikawa, K.; Ohira, M.; Kwarabayasi, Y.; Ohara, O.; Tanaka, A.; Kotani, H.; Miyajima, N.; Nomura, N. : Prediction of the coding sequences of unidentified human g.

[50029] Further studies establishing the function and utilities of GCN1L1 are found in John Hopkins OMIM database record ID 605614, and in cited publications numbered 677 and

9379 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Tumor Necrosis Factor Receptor Superfamily, Member 10b (TNFRSF10B, Accession NM_003842) is another VGAM1438 host target gene. TNFRSF10B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TNFRSF10B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFRSF10B BINDING SITE, designated SEQ ID:9934, to the nucleotide sequence of VGAM1438 RNA, herein designated VGAM RNA, also designated SEQ ID:4149.

[50030] Another function of VGAM1438 is therefore inhibition of Tumor Necrosis Factor Receptor Superfamily, Member 10b (TNFRSF10B, Accession NM_003842), a gene which forms complex that induces apoptosis. Accordingly, utilities of VGAM1438 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFRSF10B. The function of TNFRSF10B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM400. Enabled Homolog (Drosophila)

(ENAH, Accession NM_018212) is another VGAM1438 host target gene. ENAH BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ENAH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ENAH BINDING SITE, designated SEQ ID:20123, to the nucleotide sequence of VGAM1438 RNA, herein designated VGAM RNA, also designated SEQ ID:4149.

[50031] Another function of VGAM1438 is therefore inhibition of Enabled Homolog (Drosophila) (ENAH, Accession NM_018212). Accordingly, utilities of VGAM1438 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ENAH. Solute Carrier Family 5 (choline transporter), Member 7 (SLC5A7, Accession NM_021815) is another VGAM1438 host target gene. SLC5A7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC5A7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC5A7 BINDING SITE, designated SEQ

ID:22388, to the nucleotide sequence of VGAM1438 RNA, herein designated VGAM RNA, also designated SEQ ID:4149.

[50032] Another function of VGAM1438 is therefore inhibition of Solute Carrier Family 5 (choline transporter), Member 7 (SLC5A7, Accession NM_021815). Accordingly, utilities of VGAM1438 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC5A7. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1439 (VGAM1439) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50033] VGAM1439 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1439 was detected is described hereinabove with reference to Figs. 1–8.

[50034] VGAM1439 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bean Common Mosaic Necrosis Virus. VGAM1439 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene con-

tained in the human genome.

[50035] VGAM1439 gene encodes a VGAM1439 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1439 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1439 precursor RNA is designated SEQ ID:1425, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1425 is located at position 4013 relative to the genome of Bean Common Mosaic Necrosis Virus.

[50036] VGAM1439 precursor RNA folds onto itself, forming VGAM1439 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50037] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1439 folded precursor RNA into VGAM1439 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1439 RNA is designated SEQ ID:4150, and is provided hereinbelow with reference to the sequence listing part.

[50038] VGAM1439 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1439 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1439 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[50039] VGAM1439 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1439 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1439 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1439 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1439 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[50040] The complementary binding of VGAM1439 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1439 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1439 host target RNA into VGAM1439 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50041] It is appreciated that VGAM1439 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1439 host target genes. The mRNA of each one of this plurality of VGAM1439 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1439 RNA, herein designated VGAM RNA, and which when bound by VGAM1439 RNA causes inhibition of translation of respective one or more VGAM1439 host target proteins.

[50042] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1439 gene, herein designated VGAM GENE, on one or more VGAM1439 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[50043] It is yet further appreciated that a function of VGAM1439 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1439 include diagnosis, prevention and treatment of viral infection by Bean Common Mosaic Necrosis Virus. Specific functions, and accordingly utilities, of VGAM1439 correlate with, and may be deduced from, the identity of the host target genes which VGAM1439 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50044] Nucleotide sequences of the VGAM1439 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1439 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1439 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1439 are further described hereinbelow with reference to Table 1.

[50045] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM1439 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1439 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50046] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1439 gene, herein designated VGAM is inhibition of expression of VGAM1439 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1439 correlate with, and may be deduced from, the identity of the target genes which VGAM1439 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[50047] Ras Homolog Gene Family, Member I (ARHI, Accession NM_004675) is a VGAM1439 host target gene. ARHI BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARHI, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHI BINDING SITE, designated SEQ ID:11043, to the nucleotide sequence of VGAM1439 RNA, herein designated VGAM RNA, also designated SEQ ID:4150.

[50048] A function of VGAM1439 is therefore inhibition of Ras Homolog Gene Family, Member I (ARHI, Accession NM_004675), a gene which is a Ras-related GTP-binding protein, member I; overexpression suppresses tumors. Accordingly, utilities of VGAM1439 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHI. The function of ARHI has been established by previous studies. The Ras (see OMIM Ref. No. HRAS; 190020) superfamily of protooncogenes is among the most commonly activated in a number of cancers, including breast and ovarian tumors. By differential display PCR and by screening a normal ovarian epithelial cell cDNA library, Yu et al. (1999) identified a cDNA encoding ARHI, which they termed NOEY2. Sequence analysis predicted that the 229-amino acid ARHI protein shares 54% amino acid homology with HRAS and 56 to 62% homology with RAS-related proteins (e.g., RAP1A; 179520). ARHI contains a highly conserved GTP-binding domain, a putative effector domain distinct from that of RAS and RAP proteins, and a C-terminal membrane localization motif. Northern blot analysis detected a 1.9-kb ARHI transcript in all normal breast and ovarian epithelial cell cultures tested, as well as in normal ovary, heart, liver, pancreas,

and brain. Expression was absent in nearly all breast and ovarian cancer cell lines and all primary ovarian cancer cell lines tested. Western blot analysis detected a 26-kD ARHI protein in all normal breast and ovarian cell lines but not in any breast and ovarian cancer cell lines tested. Expression of ARHI in breast and ovarian cancer cell lines but not in lung cancer cell lines led to growth inhibition. Stimulation of normal cell lines with growth factors led to decreased expression of ARHI as well as the cell growth inhibition-associated protein WAF1 (CDKN1A; 116899). Genomic sequence analysis demonstrated that the ARHI gene contains 2 exons. RFLP analysis of genomic DNA of informative families showed that ARHI is expressed monoallelically and is imprinted maternally. By PCR analysis of a genomic library and by FISH, Yu et al. (1999) mapped the ARHI gene to 1p31, a region that is frequently deleted in breast and ovarian cancer due to loss of heterozygosity; see 167000. To study the biologic function of the ARHI tumor suppressor gene, Xu et al. (2000) generated ARHI transgenic mice with ARHI expression driven by the cytomegalovirus promoter. Overexpression of ARHI in transgenic mice resulted in a decrease in body size and impaired development in multiple organs. Defects were par-

ticularly evident in fertility and postpartum lactation. The data suggested that ARHI is a negative regulator of murine growth as well as of the development and function of the breast and ovary.

[50049] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[50050] Xu, F.; Xia, W.; Luo, R. Z.; Peng, H.; Zhao, S.; Dai, J.; Long, Y.; Zou, L.; Le, W.; Liu, J.; Parlow, A. F.; Hung, M.-C.; Bast, R. C., Jr.; Yu, Y. : The human ARHI tumor suppressor gene inhibits lactation and growth in transgenic mice. *Cancer Res.* 60: 4913–4920, 2000. ; and

[50051] Yu, Y.; Xu, F.; Peng, H.; Fang, X.; Zhao, S.; Li, Y.; Cuevas, B.; Kuo, W.-L.; Gray, J. W.; Siciliano, M.; Mills, G. B.; Bast, R. C., Jr. : NOEY2 (ARHI), an imprinted putative tumor sup.

[50052] Further studies establishing the function and utilities of ARHI are found in John Hopkins OMIM database record ID 605193, and in cited publications numbered 490 and 6607 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Coagulation Factor VIII, Procoagulant Component (hemophilia A) (F8, Accession NM_000132) is another VGAM1439 host target gene. F8 BINDING SITE is HOST TARGET binding site found

in the 3` untranslated region of mRNA encoded by F8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of F8 BINDING SITE, designated SEQ ID:5614, to the nucleotide sequence of VGAM1439 RNA, herein designated VGAM RNA, also designated SEQ ID:4150.

[50053] Another function of VGAM1439 is therefore inhibition of Coagulation Factor VIII, Procoagulant Component (hemophilia A) (F8, Accession NM_000132). Accordingly, utilities of VGAM1439 include diagnosis, prevention and treatment of diseases and clinical conditions associated with F8. Galanin Receptor 1 (GALR1, Accession NM_001480) is another VGAM1439 host target gene. GALR1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GALR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GALR1 BINDING SITE, designated SEQ ID:7218, to the nucleotide sequence of VGAM1439 RNA, herein designated VGAM RNA, also designated SEQ ID:4150.

[50054] Another function of VGAM1439 is therefore inhibition of Galanin Receptor 1 (GALR1, Accession NM_001480), a gene which plays a role in regulating ion transport. Accordingly, utilities of VGAM1439 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GALR1. The function of GALR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1245. CAPN13 (Accession NM_144575) is another VGAM1439 host target gene. CAPN13 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAPN13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAPN13 BINDING SITE, designated SEQ ID:29379, to the nucleotide sequence of VGAM1439 RNA, herein designated VGAM RNA, also designated SEQ ID:4150.

[50055] Another function of VGAM1439 is therefore inhibition of CAPN13 (Accession NM_144575). Accordingly, utilities of VGAM1439 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

CAPN13. FLJ22794 (Accession XM_166220) is another VGAM1439 host target gene. FLJ22794 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22794, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22794 BINDING SITE, designated SEQ ID:44026, to the nucleotide sequence of VGAM1439 RNA, herein designated VGAM RNA, also designated SEQ ID:4150.

[50056] Another function of VGAM1439 is therefore inhibition of FLJ22794 (Accession XM_166220). Accordingly, utilities of VGAM1439 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22794. KIAA0212 (Accession NM_014674) is another VGAM1439 host target gene. KIAA0212 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0212, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0212 BINDING SITE, designated SEQ ID:16142, to the nucleotide sequence of VGAM1439 RNA, herein design-

nated VGAM RNA, also designated SEQ ID:4150.

[50057] Another function of VGAM1439 is therefore inhibition of KIAA0212 (Accession NM_014674). Accordingly, utilities of VGAM1439 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0212. KIAA1317 (Accession XM_098368) is another VGAM1439 host target gene. KIAA1317 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1317, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1317 BINDING SITE, designated SEQ ID:41624, to the nucleotide sequence of VGAM1439 RNA, herein designated VGAM RNA, also designated SEQ ID:4150.

[50058] Another function of VGAM1439 is therefore inhibition of KIAA1317 (Accession XM_098368). Accordingly, utilities of VGAM1439 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1317. KIAA1596 (Accession XM_048128) is another VGAM1439 host target gene. KIAA1596 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1596, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1596 BINDING SITE, designated SEQ ID:35120, to the nucleotide sequence of VGAM1439 RNA, herein designated VGAM RNA, also designated SEQ ID:4150.

[50059] Another function of VGAM1439 is therefore inhibition of KIAA1596 (Accession XM_048128). Accordingly, utilities of VGAM1439 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1596. MGC21854 (Accession NM_052862) is another VGAM1439 host target gene. MGC21854 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC21854, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC21854 BINDING SITE, designated SEQ ID:27448, to the nucleotide sequence of VGAM1439 RNA, herein designated VGAM RNA, also designated SEQ ID:4150.

[50060] Another function of VGAM1439 is therefore inhibition of MGC21854 (Accession NM_052862). Accordingly, utilities of VGAM1439 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with MGC21854. Serine/threonine Kinase 17a (apoptosis-inducing) (STK17A, Accession NM_004760) is another VGAM1439 host target gene. STK17A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STK17A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STK17A BINDING SITE, designated SEQ ID:11153, to the nucleotide sequence of VGAM1439 RNA, herein designated VGAM RNA, also designated SEQ ID:4150.

[50061] Another function of VGAM1439 is therefore inhibition of Serine/threonine Kinase 17a (apoptosis-inducing) (STK17A, Accession NM_004760). Accordingly, utilities of VGAM1439 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STK17A. LOC148545 (Accession XM_086226) is another VGAM1439 host target gene. LOC148545 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148545, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC148545 BINDING SITE, designated SEQ ID:38553, to the nucleotide sequence of VGAM1439 RNA, herein designated VGAM RNA, also designated SEQ ID:4150.

[50062] Another function of VGAM1439 is therefore inhibition of LOC148545 (Accession XM_086226). Accordingly, utilities of VGAM1439 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148545. LOC219347 (Accession XM_167564) is another VGAM1439 host target gene. LOC219347 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC219347, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219347 BINDING SITE, designated SEQ ID:44679, to the nucleotide sequence of VGAM1439 RNA, herein designated VGAM RNA, also designated SEQ ID:4150.

[50063] Another function of VGAM1439 is therefore inhibition of LOC219347 (Accession XM_167564). Accordingly, utilities of VGAM1439 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219347. LOC51696 (Accession NM_016217) is an-

other VGAM1439 host target gene. LOC51696 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51696, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51696 BINDING SITE, designated SEQ ID:18311, to the nucleotide sequence of VGAM1439 RNA, herein designated VGAM RNA, also designated SEQ ID:4150.

[50064] Another function of VGAM1439 is therefore inhibition of LOC51696 (Accession NM_016217). Accordingly, utilities of VGAM1439 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51696. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1440 (VGAM1440) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50065] VGAM1440 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1440 was detected is de-

scribed hereinabove with reference to Figs. 1–8.

[50066] VGAM1440 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bean Common Mosaic Necrosis Virus. VGAM1440 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50067] VGAM1440 gene encodes a VGAM1440 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1440 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1440 precursor RNA is designated SEQ ID:1426, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1426 is located at position 5334 relative to the genome of Bean Common Mosaic Necrosis Virus.

[50068] VGAM1440 precursor RNA folds onto itself, forming VGAM1440 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA

gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50069] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1440 folded precursor RNA into VGAM1440 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 63%) nucleotide sequence of VGAM1440 RNA is designated SEQ ID:4151, and is provided hereinbelow with reference to the sequence listing part.

[50070] VGAM1440 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1440 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1440 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[50071] VGAM1440 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1440 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1440 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1440 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1440 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[50072] The complementary binding of VGAM1440 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1440 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1440 host target RNA into VGAM1440 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50073] It is appreciated that VGAM1440 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1440 host target genes. The mRNA of each one of this plurality of VGAM1440 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1440 RNA, herein designated VGAM RNA, and which when bound by VGAM1440 RNA causes inhibition of translation of respective one or more VGAM1440 host target proteins.

[50074] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1440 gene, herein designated VGAM GENE, on one or more VGAM1440 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[50075] It is yet further appreciated that a function of VGAM1440 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1440 include diagnosis, prevention and treatment of viral infection by Bean Common Mosaic Necrosis Virus. Specific functions, and accordingly utilities, of VGAM1440 correlate with, and may be deduced from, the identity of the host target genes which VGAM1440 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50076] Nucleotide sequences of the VGAM1440 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1440 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM1440 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1440 are further described hereinbelow with reference to Table 1.

[50077] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1440 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1440 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50078] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1440 gene, herein designated VGAM is inhibition of expression of VGAM1440 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1440 correlate with, and may be deduced from, the identity of the target genes which VGAM1440 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[50079] Myeloma Overexpressed Gene (in a subset of t(11;14) Positive Multiple Myelomas) (MYEOV, Accession NM_138768) is a VGAM1440 host target gene. MYEOV BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MYEOV, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYEOV BINDING SITE, designated SEQ ID:28999, to the nucleotide sequence of VGAM1440 RNA, herein designated VGAM RNA, also designated SEQ ID:4151.

[50080] A function of VGAM1440 is therefore inhibition of Myeloma Overexpressed Gene (in a subset of t(11;14) Positive Multiple Myelomas) (MYEOV, Accession NM_138768), a gene which is encoded by MYELOMA OVEREXPRESSED GENE. Accordingly, utilities of VGAM1440 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYEOV. The function of MYEOV and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM471.Solute Carrier Family 9 (sodium/hydrogen exchanger), Isoform 1 (antiporter, Na⁺/H⁺, amiloride sensitive) (SLC9A1, Accession XM_046881) is another VGAM1440 host target gene. SLC9A1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SLC9A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC9A1 BINDING SITE, designated SEQ ID:34855, to the nucleotide sequence of VGAM1440 RNA, herein designated VGAM RNA, also designated SEQ ID:4151.

[50081] Another function of VGAM1440 is therefore inhibition of Solute Carrier Family 9 (sodium/hydrogen exchanger), Isoform 1 (antiporter, Na⁺/H⁺, amiloride sensitive) (SLC9A1, Accession XM_046881), a gene which is involved in pH regulation to eliminate acids generated by active metabolism or to counter adverse environmental conditions. Accordingly, utilities of VGAM1440 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC9A1. The function of SLC9A1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM206.DKFZP434B205 (Accession XM_059966) is another VGAM1440 host target gene. DKFZP434B205 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434B205, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of DKFZP434B205 BINDING SITE, designated SEQ ID:37127, to the nucleotide sequence of VGAM1440 RNA, herein designated VGAM RNA, also designated SEQ ID:4151.

[50082] Another function of VGAM1440 is therefore inhibition of DKFZP434B205 (Accession XM_059966). Accordingly, utilities of VGAM1440 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434B205. DKFZp434F142 (Accession NM_032254) is another VGAM1440 host target gene. DKFZp434F142 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp434F142, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434F142 BINDING SITE, designated SEQ ID:25992, to the nucleotide sequence of VGAM1440 RNA, herein designated VGAM RNA, also designated SEQ ID:4151.

[50083] Another function of VGAM1440 is therefore inhibition of DKFZp434F142 (Accession NM_032254). Accordingly, utilities of VGAM1440 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with DKFZp434F142. FLJ14437 (Accession NM_032578) is another VGAM1440 host target gene. FLJ14437 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ14437, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14437 BINDING SITE, designated SEQ ID:26310, to the nucleotide sequence of VGAM1440 RNA, herein designated VGAM RNA, also designated SEQ ID:4151.

[50084] Another function of VGAM1440 is therefore inhibition of FLJ14437 (Accession NM_032578). Accordingly, utilities of VGAM1440 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14437. KIAA0522 (Accession XM_050404) is another VGAM1440 host target gene. KIAA0522 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0522, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0522 BINDING SITE, designated SEQ ID:35624, to the

nucleotide sequence of VGAM1440 RNA, herein designated VGAM RNA, also designated SEQ ID:4151.

[50085] Another function of VGAM1440 is therefore inhibition of KIAA0522 (Accession XM_050404). Accordingly, utilities of VGAM1440 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0522. MGC11287 (Accession NM_031464) is another VGAM1440 host target gene. MGC11287 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC11287, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC11287 BINDING SITE, designated SEQ ID:25500, to the nucleotide sequence of VGAM1440 RNA, herein designated VGAM RNA, also designated SEQ ID:4151.

[50086] Another function of VGAM1440 is therefore inhibition of MGC11287 (Accession NM_031464). Accordingly, utilities of VGAM1440 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC11287. NPC1 (Niemann–Pick disease, type C1, gene)–like 1 (NPC1L1, Accession NM_013389) is another VGAM1440 host target gene. NPC1L1 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NPC1L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NPC1L1 BINDING SITE, designated SEQ ID:15039, to the nucleotide sequence of VGAM1440 RNA, herein designated VGAM RNA, also designated SEQ ID:4151.

[50087] Another function of VGAM1440 is therefore inhibition of NPC1 (Niemann–Pick disease, type C1, gene)–like 1 (NPC1L1, Accession NM_013389). Accordingly, utilities of VGAM1440 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NPC1L1. PP3501 (Accession NM_021731) is another VGAM1440 host target gene. PP3501 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PP3501, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PP3501 BINDING SITE, designated SEQ ID:22330, to the nucleotide sequence of VGAM1440 RNA, herein designated VGAM RNA, also designated SEQ ID:4151.

[50088] Another function of VGAM1440 is therefore inhibition of PP3501 (Accession NM_021731). Accordingly, utilities of VGAM1440 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PP3501. LOC129676 (Accession XM_065341) is another VGAM1440 host target gene. LOC129676 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC129676, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC129676 BINDING SITE, designated SEQ ID:37282, to the nucleotide sequence of VGAM1440 RNA, herein designated VGAM RNA, also designated SEQ ID:4151.

[50089] Another function of VGAM1440 is therefore inhibition of LOC129676 (Accession XM_065341). Accordingly, utilities of VGAM1440 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC129676. LOC145624 (Accession XM_096824) is another VGAM1440 host target gene. LOC145624 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC145624, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145624 BINDING SITE, designated SEQ ID:40549, to the nucleotide sequence of VGAM1440 RNA, herein designated VGAM RNA, also designated SEQ ID:4151.

[50090] Another function of VGAM1440 is therefore inhibition of LOC145624 (Accession XM_096824). Accordingly, utilities of VGAM1440 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145624. LOC146988 (Accession XM_097150) is another VGAM1440 host target gene. LOC146988 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146988, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146988 BINDING SITE, designated SEQ ID:40778, to the nucleotide sequence of VGAM1440 RNA, herein designated VGAM RNA, also designated SEQ ID:4151.

[50091] Another function of VGAM1440 is therefore inhibition of LOC146988 (Accession XM_097150). Accordingly, utilities of VGAM1440 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC146988. LOC147004 (Accession XM_097155) is another VGAM1440 host target gene. LOC147004 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147004, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147004 BINDING SITE, designated SEQ ID:40781, to the nucleotide sequence of VGAM1440 RNA, herein designated VGAM RNA, also designated SEQ ID:4151.

[50092] Another function of VGAM1440 is therefore inhibition of LOC147004 (Accession XM_097155). Accordingly, utilities of VGAM1440 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147004. LOC148181 (Accession XM_086083) is another VGAM1440 host target gene. LOC148181 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148181, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148181 BINDING SITE, designated SEQ ID:38481, to the nucleotide sequence of VGAM1440 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4151.

[50093] Another function of VGAM1440 is therefore inhibition of LOC148181 (Accession XM_086083). Accordingly, utilities of VGAM1440 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148181. LOC148930 (Accession XM_086369) is another VGAM1440 host target gene. LOC148930 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148930, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148930 BINDING SITE, designated SEQ ID:38622, to the nucleotide sequence of VGAM1440 RNA, herein designated VGAM RNA, also designated SEQ ID:4151.

[50094] Another function of VGAM1440 is therefore inhibition of LOC148930 (Accession XM_086369). Accordingly, utilities of VGAM1440 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148930. LOC150630 (Accession XM_097931) is another VGAM1440 host target gene. LOC150630 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150630, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150630 BINDING SITE, designated SEQ ID:41238, to the nucleotide sequence of VGAM1440 RNA, herein designated VGAM RNA, also designated SEQ ID:4151.

[50095] Another function of VGAM1440 is therefore inhibition of LOC150630 (Accession XM_097931). Accordingly, utilities of VGAM1440 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150630. LOC151445 (Accession XM_045283) is another VGAM1440 host target gene. LOC151445 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151445, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151445 BINDING SITE, designated SEQ ID:34420, to the nucleotide sequence of VGAM1440 RNA, herein designated VGAM RNA, also designated SEQ ID:4151.

[50096] Another function of VGAM1440 is therefore inhibition of LOC151445 (Accession XM_045283). Accordingly, utilities of VGAM1440 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC151445. LOC152313 (Accession XM_098190) is another VGAM1440 host target gene. LOC152313 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC152313, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152313 BINDING SITE, designated SEQ ID:41481, to the nucleotide sequence of VGAM1440 RNA, herein designated VGAM RNA, also designated SEQ ID:4151.

[50097] Another function of VGAM1440 is therefore inhibition of LOC152313 (Accession XM_098190). Accordingly, utilities of VGAM1440 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152313. LOC154990 (Accession XM_088109) is another VGAM1440 host target gene. LOC154990 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC154990, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154990 BINDING SITE, designated SEQ ID:39521, to

the nucleotide sequence of VGAM1440 RNA, herein designated VGAM RNA, also designated SEQ ID:4151.

[50098] Another function of VGAM1440 is therefore inhibition of LOC154990 (Accession XM_088109). Accordingly, utilities of VGAM1440 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154990. LOC158476 (Accession XM_098955) is another VGAM1440 host target gene. LOC158476 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158476, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158476 BINDING SITE, designated SEQ ID:42002, to the nucleotide sequence of VGAM1440 RNA, herein designated VGAM RNA, also designated SEQ ID:4151.

[50099] Another function of VGAM1440 is therefore inhibition of LOC158476 (Accession XM_098955). Accordingly, utilities of VGAM1440 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158476. LOC158835 (Accession XM_088683) is another VGAM1440 host target gene. LOC158835 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC158835, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158835 BINDING SITE, designated SEQ ID:39894, to the nucleotide sequence of VGAM1440 RNA, herein designated VGAM RNA, also designated SEQ ID:4151.

[50100] Another function of VGAM1440 is therefore inhibition of LOC158835 (Accession XM_088683). Accordingly, utilities of VGAM1440 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158835. LOC196872 (Accession XM_113760) is another VGAM1440 host target gene. LOC196872 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC196872, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196872 BINDING SITE, designated SEQ ID:42417, to the nucleotide sequence of VGAM1440 RNA, herein designated VGAM RNA, also designated SEQ ID:4151.

[50101] Another function of VGAM1440 is therefore inhibition of LOC196872 (Accession XM_113760). Accordingly, utilities

of VGAM1440 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196872. LOC200261 (Accession XM_114172) is another VGAM1440 host target gene. LOC200261 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200261, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200261 BINDING SITE, designated SEQ ID:42753, to the nucleotide sequence of VGAM1440 RNA, herein designated VGAM RNA, also designated SEQ ID:4151.

[50102] Another function of VGAM1440 is therefore inhibition of LOC200261 (Accession XM_114172). Accordingly, utilities of VGAM1440 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200261. LOC222134 (Accession XM_168432) is another VGAM1440 host target gene. LOC222134 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222134, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC222134 BINDING SITE, designated SEQ ID:45173, to the nucleotide sequence of VGAM1440 RNA, herein designated VGAM RNA, also designated SEQ ID:4151.

[50103] Another function of VGAM1440 is therefore inhibition of LOC222134 (Accession XM_168432). Accordingly, utilities of VGAM1440 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222134. LOC254173 (Accession XM_173022) is another VGAM1440 host target gene. LOC254173 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254173, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254173 BINDING SITE, designated SEQ ID:46286, to the nucleotide sequence of VGAM1440 RNA, herein designated VGAM RNA, also designated SEQ ID:4151.

[50104] Another function of VGAM1440 is therefore inhibition of LOC254173 (Accession XM_173022). Accordingly, utilities of VGAM1440 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254173. LOC255975 (Accession XM_171083) is another VGAM1440 host target gene. LOC255975 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255975, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255975 BINDING SITE, designated SEQ ID:45891, to the nucleotide sequence of VGAM1440 RNA, herein designated VGAM RNA, also designated SEQ ID:4151.

[50105] Another function of VGAM1440 is therefore inhibition of LOC255975 (Accession XM_171083). Accordingly, utilities of VGAM1440 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255975. LOC256529 (Accession XM_174314) is another VGAM1440 host target gene. LOC256529 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256529, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256529 BINDING SITE, designated SEQ ID:46589, to the nucleotide sequence of VGAM1440 RNA, herein designated VGAM RNA, also designated SEQ ID:4151.

[50106] Another function of VGAM1440 is therefore inhibition of

LOC256529 (Accession XM_174314). Accordingly, utilities of VGAM1440 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256529. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1441 (VGAM1441) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50107] VGAM1441 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1441 was detected is described hereinabove with reference to Figs. 1-8.

[50108] VGAM1441 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bean Common Mosaic Necrosis Virus. VGAM1441 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50109] VGAM1441 gene encodes a VGAM1441 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1441 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1441 precursor RNA is designated SEQ ID:1427, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1427 is located at position 5472 relative to the genome of Bean Common Mosaic Necrosis Virus.

- [50110] VGAM1441 precursor RNA folds onto itself, forming VGAM1441 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [50111] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1441 folded precursor RNA into VGAM1441 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide se-

quence of VGAM1441 RNA is designated SEQ ID:4152, and is provided hereinbelow with reference to the sequence listing part.

[50112] VGAM1441 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1441 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1441 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[50113] VGAM1441 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1441 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1441 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM1441 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1441 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[50114] The complementary binding of VGAM1441 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1441 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1441 host target RNA into VGAM1441 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50115] It is appreciated that VGAM1441 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1441 host target genes. The mRNA of each one of this plurality of VGAM1441 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1441 RNA, herein designated VGAM RNA, and which when bound by VGAM1441 RNA causes inhibition of translation of respective one or more VGAM1441 host target proteins.

[50116] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1441 gene, herein designated VGAM GENE, on one or more VGAM1441 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[50117] It is yet further appreciated that a function of VGAM1441

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1441 include diagnosis, prevention and treatment of viral infection by Bean Common Mosaic Necrosis Virus. Specific functions, and accordingly utilities, of VGAM1441 correlate with, and may be deduced from, the identity of the host target genes which VGAM1441 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50118] Nucleotide sequences of the VGAM1441 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1441 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1441 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1441 are further described hereinbelow with reference to Table 1.

[50119] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1441 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1441 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50120] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1441 gene, herein designated VGAM is inhibition of expression of VGAM1441 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1441 correlate with, and may be deduced from, the identity of the target genes which VGAM1441 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[50121] Thiopurine S-methyltransferase (TPMT, Accession NM_000367) is a VGAM1441 host target gene. TPMT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TPMT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TPMT BINDING SITE, designated SEQ ID:5938, to the nucleotide sequence of VGAM1441 RNA, herein designated VGAM RNA, also designated SEQ ID:4152.

[50122] A function of VGAM1441 is therefore inhibition of Thiopurine S-methyltransferase (TPMT, Accession NM_000367), a gene which catalyzes the s-methylation of thiopurine drugs such as 6-mercaptopurine. Accordingly, utilities of VGAM1441 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with TPMT. The function of TPMT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM682. Heterogeneous Nuclear Ribonucleoprotein A3 (HNRPA3, Accession NM_005758) is another VGAM1441 host target gene. HNRPA3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HNRPA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HNRPA3 BINDING SITE, designated SEQ ID:12323, to the nucleotide sequence of VGAM1441 RNA, herein designated VGAM RNA, also designated SEQ ID:4152.

[50123] Another function of VGAM1441 is therefore inhibition of Heterogeneous Nuclear Ribonucleoprotein A3 (HNRPA3, Accession NM_005758). Accordingly, utilities of VGAM1441 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HNRPA3. LOC201564 (Accession XM_087368) is another VGAM1441 host target gene. LOC201564 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by LOC201564, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201564 BINDING SITE, designated SEQ ID:39200, to the nucleotide sequence of VGAM1441 RNA, herein designated VGAM RNA, also designated SEQ ID:4152.

[50124] Another function of VGAM1441 is therefore inhibition of LOC201564 (Accession XM_087368). Accordingly, utilities of VGAM1441 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201564. LOC220988 (Accession XM_165561) is another VGAM1441 host target gene. LOC220988 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220988, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220988 BINDING SITE, designated SEQ ID:43682, to the nucleotide sequence of VGAM1441 RNA, herein designated VGAM RNA, also designated SEQ ID:4152.

[50125] Another function of VGAM1441 is therefore inhibition of LOC220988 (Accession XM_165561). Accordingly, utilities

of VGAM1441 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220988. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1442 (VGAM1442) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50126] VGAM1442 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1442 was detected is described hereinabove with reference to Figs. 1-8.

[50127] VGAM1442 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bean Common Mosaic Necrosis Virus. VGAM1442 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50128] VGAM1442 gene encodes a VGAM1442 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1442 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM1442 precursor RNA is designated SEQ ID:1428, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1428 is located at position 7222 relative to the genome of Bean Common Mosaic Necrosis Virus.

[50129] VGAM1442 precursor RNA folds onto itself, forming VGAM1442 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50130] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1442 folded precursor RNA into VGAM1442 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1442 RNA is designated SEQ ID:4153, and

is provided hereinbelow with reference to the sequence listing part.

[50131] VGAM1442 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1442 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1442 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[50132] VGAM1442 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1442 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1442 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM1442 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1442 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[50133] The complementary binding of VGAM1442 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1442 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1442 host target RNA into VGAM1442 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50134] It is appreciated that VGAM1442 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1442 host target genes. The mRNA of each one of this plurality of VGAM1442 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM1442 RNA, herein designated VGAM RNA, and which when bound by VGAM1442 RNA causes inhibition of translation of respective one or more VGAM1442 host target proteins.

[50135] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1442 gene, herein designated VGAM GENE, on one or more VGAM1442 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[50136] It is yet further appreciated that a function of VGAM1442 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1442 include diagnosis, prevention and treatment of viral infection by Bean Common Mosaic Necrosis Virus. Specific functions, and accordingly utilities, of VGAM1442 correlate with, and may be deduced from, the identity of the host target genes which VGAM1442 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50137] Nucleotide sequences of the VGAM1442 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1442 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1442 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1442 are further described hereinbelow with reference to Table 1.

[50138] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1442 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1442 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50139] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM1442 gene, herein designated VGAM is inhibition of expression of VGAM1442 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1442 correlate with, and may be deduced from, the identity of the target genes which VGAM1442 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[50140] Gamma-aminobutyric Acid (GABA) A Receptor, Epsilon (GABRE, Accession NM_021990) is a VGAM1442 host target gene. GABRE BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GABRE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GABRE BINDING SITE, designated SEQ ID:22530, to the nucleotide sequence of VGAM1442 RNA, herein designated VGAM RNA, also designated SEQ ID:4153.

[50141] A function of VGAM1442 is therefore inhibition of Gamma-aminobutyric Acid (GABA) A Receptor, Epsilon (GABRE, Accession NM_021990), a gene which mediates neuronal inhibition by binding to the gaba/benzodiazepine receptor and opening an integral chloride

channel. Accordingly, utilities of VGAM1442 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GABRE. The function of GABRE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM259. Inducible T-cell Co-stimulator (ICOS, Accession NM_012092) is another VGAM1442 host target gene. ICOS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ICOS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ICOS BINDING SITE, designated SEQ ID:14389, to the nucleotide sequence of VGAM1442 RNA, herein designated VGAM RNA, also designated SEQ ID:4153.

[50142] Another function of VGAM1442 is therefore inhibition of Inducible T-cell Co-stimulator (ICOS, Accession NM_012092), a gene which forms homodimers and functions as an inducible T-cell co-stimulator. Accordingly, utilities of VGAM1442 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ICOS. The function of ICOS and its association with

various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM18.NEBL (Accession NM_006393) is another VGAM1442 host target gene. NEBL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NEBL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NEBL BINDING SITE, designated SEQ ID:13101, to the nucleotide sequence of VGAM1442 RNA, herein designated VGAM RNA, also designated SEQ ID:4153.

[50143] Another function of VGAM1442 is therefore inhibition of NEBL (Accession NM_006393). Accordingly, utilities of VGAM1442 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NEBL. Recombination Activating Gene 1 (RAG1, Accession NM_000448) is another VGAM1442 host target gene. RAG1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RAG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of RAG1 BINDING SITE, designated SEQ ID:6038, to the nucleotide sequence of VGAM1442 RNA, herein designated VGAM RNA, also designated SEQ ID:4153.

[50144] Another function of VGAM1442 is therefore inhibition of Recombination Activating Gene 1 (RAG1, Accession NM_000448). Accordingly, utilities of VGAM1442 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAG1. Retinoblastoma-like 2 (p130) (RBL2, Accession NM_005611) is another VGAM1442 host target gene. RBL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RBL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RBL2 BINDING SITE, designated SEQ ID:12132, to the nucleotide sequence of VGAM1442 RNA, herein designated VGAM RNA, also designated SEQ ID:4153.

[50145] Another function of VGAM1442 is therefore inhibition of Retinoblastoma-like 2 (p130) (RBL2, Accession NM_005611), a gene which may be a tumor suppressor. Accordingly, utilities of VGAM1442 include diagnosis, prevention and treatment of diseases and clinical condi-

tions associated with RBL2. The function of RBL2 has been established by previous studies. Mayol et al. (1993) cloned a retinoblastoma-related human gene, referred to as RB2, on the basis of sequence homology of the E1A-binding domain of the retinoblastoma gene (RB1; 180200). Structural homology with RB1 suggested a possible function of RB2 as a tumor suppressor gene. Yeung et al. (1993) mapped the gene to human chromosome 16q12.2 and rat chromosome 19, using fluorescence in situ hybridization and somatic hybrid cell analysis, respectively. Based on known syntenic relationships among human, rat and mouse, the data suggested that the mouse homolog resides on chromosome 8. Deletions of chromosome 16q have been found in several human neoplasms, including breast, ovarian, hepatic, and prostatic cancers, which supports the involvement of RB2 in human cancer as a tumor suppressor gene. This locus is symbolized RBL2 because it was identified after the gene on chromosome 20, which is symbolized RBL1 (OMIM Ref. No. 116957). RBL1 has a molecular weight of 107 kD; RBL2 has a molecular weight of about 120 kD.

[50146] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [50147] Baldi, A.; Boccia, V.; Claudio, P. P.; De Luca, A.; Giordano, A. : Genomic structure of the human retinoblastoma-related Rb2/p130 gene. Proc. Nat. Acad. Sci. 93: 4629–4632, 1996. ; and
- [50148] Mayol, X.; Grana, X.; Baldi, A.; Sang, N.; Hu, Q.; Giordano, A. : Cloning of a new member of the retinoblastoma gene family (pRb2) which binds to the E1A transforming domain. Oncogene.
- [50149] Further studies establishing the function and utilities of RBL2 are found in John Hopkins OMIM database record ID 180203, and in cited publications numbered 5666–5668 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. SH3-domain Binding Protein 2 (SH3BP2, Accession NM_003023) is another VGAM1442 host target gene. SH3BP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SH3BP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SH3BP2 BINDING SITE, designated SEQ ID:8944, to the nucleotide sequence of VGAM1442 RNA, herein designated VGAM

RNA, also designated SEQ ID:4153.

[50150] Another function of VGAM1442 is therefore inhibition of SH3-domain Binding Protein 2 (SH3BP2, Accession NM_003023). Accordingly, utilities of VGAM1442 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SH3BP2. Tafazzin (cardiomyopathy, dilated 3A (X-linked); Endocardial Fibroelastosis 2; Barth Syndrome) (TAZ, Accession NM_000116) is another VGAM1442 host target gene. TAZ BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TAZ, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TAZ BINDING SITE, designated SEQ ID:5587, to the nucleotide sequence of VGAM1442 RNA, herein designated VGAM RNA, also designated SEQ ID:4153.

[50151] Another function of VGAM1442 is therefore inhibition of Tafazzin (cardiomyopathy, dilated 3A (X-linked); Endocardial Fibroelastosis 2; Barth Syndrome) (TAZ, Accession NM_000116). Accordingly, utilities of VGAM1442 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAZ. TIM3 (Accession

NM_032782) is another VGAM1442 host target gene. TIM3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TIM3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIM3 BINDING SITE, designated SEQ ID:26525, to the nucleotide sequence of VGAM1442 RNA, herein designated VGAM RNA, also designated SEQ ID:4153.

[50152] Another function of VGAM1442 is therefore inhibition of TIM3 (Accession NM_032782), a gene which regulates macrophage activation and enhances the severity of experimental autoimmune encephalomyelitis in mice. Accordingly, utilities of VGAM1442 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIM3. The function of TIM3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM909. Zinc Finger Protein 10 (KOX 1) (ZNF10, Accession NM_015394) is another VGAM1442 host target gene. ZNF10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF10, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF10 BINDING SITE, designated SEQ ID:17694, to the nucleotide sequence of VGAM1442 RNA, herein designated VGAM RNA, also designated SEQ ID:4153.

[50153] Another function of VGAM1442 is therefore inhibition of Zinc Finger Protein 10 (KOX 1) (ZNF10, Accession NM_015394), a gene which may function as a transcriptional regulator. Accordingly, utilities of VGAM1442 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF10. The function of ZNF10 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM36. Zinc Finger Protein 35 (clone HF.10) (ZNF35, Accession NM_003420) is another VGAM1442 host target gene. ZNF35 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ZNF35, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF35 BINDING SITE, designated SEQ ID:9465,

to the nucleotide sequence of VGAM1442 RNA, herein designated VGAM RNA, also designated SEQ ID:4153.

[50154] Another function of VGAM1442 is therefore inhibition of Zinc Finger Protein 35 (clone HF.10) (ZNF35, Accession NM_003420). Accordingly, utilities of VGAM1442 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF35. Chromosome 1 Open Reading Frame 22 (C1orf22, Accession NM_025191) is another VGAM1442 host target gene. C1orf22 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C1orf22, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1orf22 BINDING SITE, designated SEQ ID:24838, to the nucleotide sequence of VGAM1442 RNA, herein designated VGAM RNA, also designated SEQ ID:4153.

[50155] Another function of VGAM1442 is therefore inhibition of Chromosome 1 Open Reading Frame 22 (C1orf22, Accession NM_025191). Accordingly, utilities of VGAM1442 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf22. C20orf180 (Accession NM_018431) is another VGAM1442 host target

gene. C20orf180 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf180, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf180 BINDING SITE, designated SEQ ID:20495, to the nucleotide sequence of VGAM1442 RNA, herein designated VGAM RNA, also designated SEQ ID:4153.

[50156] Another function of VGAM1442 is therefore inhibition of C20orf180 (Accession NM_018431). Accordingly, utilities of VGAM1442 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf180. FLJ10751 (Accession NM_018205) is another VGAM1442 host target gene. FLJ10751 BINDING SITE1 and FLJ10751 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLJ10751, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10751 BINDING SITE1 and FLJ10751 BINDING SITE2, designated SEQ ID:20094 and SEQ ID:20193 respectively, to the nucleotide sequence of

VGAM1442 RNA, herein designated VGAM RNA, also designated SEQ ID:4153.

[50157] Another function of VGAM1442 is therefore inhibition of FLJ10751 (Accession NM_018205). Accordingly, utilities of VGAM1442 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10751. Golgi Autoantigen, Golgin Subfamily A, 1 (GOLGA1, Accession NM_002077) is another VGAM1442 host target gene. GOLGA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GOLGA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GOLGA1 BINDING SITE, designated SEQ ID:7860, to the nucleotide sequence of VGAM1442 RNA, herein designated VGAM RNA, also designated SEQ ID:4153.

[50158] Another function of VGAM1442 is therefore inhibition of Golgi Autoantigen, Golgin Subfamily A, 1 (GOLGA1, Accession NM_002077). Accordingly, utilities of VGAM1442 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GOLGA1. GS3955 (Accession NM_021643) is another VGAM1442 host target

gene. GS3955 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by GS3955, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GS3955 BINDING SITE, designated SEQ ID:22303, to the nucleotide sequence of VGAM1442 RNA, herein designated VGAM RNA, also designated SEQ ID:4153.

[50159] Another function of VGAM1442 is therefore inhibition of GS3955 (Accession NM_021643). Accordingly, utilities of VGAM1442 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GS3955. KIAA0261 (Accession XM_042946) is another VGAM1442 host target gene. KIAA0261 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0261, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0261 BINDING SITE, designated SEQ ID:33833, to the nucleotide sequence of VGAM1442 RNA, herein designated VGAM RNA, also designated SEQ ID:4153.

[50160] Another function of VGAM1442 is therefore inhibition of KIAA0261 (Accession XM_042946). Accordingly, utilities of VGAM1442 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0261. NDRG Family Member 4 (NDRG4, Accession NM_022910) is another VGAM1442 host target gene. NDRG4 BINDING SITE1 and NDRG4 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by NDRG4, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NDRG4 BINDING SITE1 and NDRG4 BINDING SITE2, designated SEQ ID:23214 and SEQ ID:21699 respectively, to the nucleotide sequence of VGAM1442 RNA, herein designated VGAM RNA, also designated SEQ ID:4153.

[50161] Another function of VGAM1442 is therefore inhibition of NDRG Family Member 4 (NDRG4, Accession NM_022910). Accordingly, utilities of VGAM1442 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NDRG4. RNAHP (Accession NM_007372) is another VGAM1442 host target gene. RNAHP BINDING SITE is HOST TARGET binding site found

in the 3` untranslated region of mRNA encoded by RNAHP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNAHP BINDING SITE, designated SEQ ID:14300, to the nucleotide sequence of VGAM1442 RNA, herein designated VGAM RNA, also designated SEQ ID:4153.

[50162] Another function of VGAM1442 is therefore inhibition of RNAHP (Accession NM_007372). Accordingly, utilities of VGAM1442 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNAHP. SEC15B (Accession XM_039570) is another VGAM1442 host target gene. SEC15B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SEC15B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEC15B BINDING SITE, designated SEQ ID:33124, to the nucleotide sequence of VGAM1442 RNA, herein designated VGAM RNA, also designated SEQ ID:4153.

[50163] Another function of VGAM1442 is therefore inhibition of

SEC15B (Accession XM_039570). Accordingly, utilities of VGAM1442 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEC15B. Solute Carrier Family 26, Member 10 (SLC26A10, Accession NM_133489) is another VGAM1442 host target gene. SLC26A10 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SLC26A10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC26A10 BINDING SITE, designated SEQ ID:28559, to the nucleotide sequence of VGAM1442 RNA, herein designated VGAM RNA, also designated SEQ ID:4153.

[50164] Another function of VGAM1442 is therefore inhibition of Solute Carrier Family 26, Member 10 (SLC26A10, Accession NM_133489). Accordingly, utilities of VGAM1442 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC26A10. TU3A (Accession NM_007177) is another VGAM1442 host target gene. TU3A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TU3A, corresponding to a HOST TARGET binding site such

as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TU3A BINDING SITE, designated SEQ ID:14033, to the nucleotide sequence of VGAM1442 RNA, herein designated VGAM RNA, also designated SEQ ID:4153.

[50165] Another function of VGAM1442 is therefore inhibition of TU3A (Accession NM_007177). Accordingly, utilities of VGAM1442 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TU3A. Zinc Finger Protein 91 Homolog (mouse) (ZFP91, Accession NM_053023) is another VGAM1442 host target gene. ZFP91 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZFP91, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZFP91 BINDING SITE, designated SEQ ID:27576, to the nucleotide sequence of VGAM1442 RNA, herein designated VGAM RNA, also designated SEQ ID:4153.

[50166] Another function of VGAM1442 is therefore inhibition of Zinc Finger Protein 91 Homolog (mouse) (ZFP91, Accession NM_053023). Accordingly, utilities of VGAM1442 in-

clude diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFP91. LOC130612 (Accession XM_059461) is another VGAM1442 host target gene. LOC130612 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC130612, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130612 BINDING SITE, designated SEQ ID:36999, to the nucleotide sequence of VGAM1442 RNA, herein designated VGAM RNA, also designated SEQ ID:4153.

[50167] Another function of VGAM1442 is therefore inhibition of LOC130612 (Accession XM_059461). Accordingly, utilities of VGAM1442 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130612. LOC151195 (Accession XM_087125) is another VGAM1442 host target gene. LOC151195 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC151195, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC151195 BINDING SITE, designated SEQ ID:39076, to the nucleotide sequence of VGAM1442 RNA, herein designated VGAM RNA, also designated SEQ ID:4153.

[50168] Another function of VGAM1442 is therefore inhibition of LOC151195 (Accession XM_087125). Accordingly, utilities of VGAM1442 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151195. LOC152220 (Accession XM_098176) is another VGAM1442 host target gene. LOC152220 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152220, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152220 BINDING SITE, designated SEQ ID:41442, to the nucleotide sequence of VGAM1442 RNA, herein designated VGAM RNA, also designated SEQ ID:4153.

[50169] Another function of VGAM1442 is therefore inhibition of LOC152220 (Accession XM_098176). Accordingly, utilities of VGAM1442 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152220. LOC196527 (Accession XM_113743) is another VGAM1442 host target gene. LOC196527 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196527, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196527 BINDING SITE, designated SEQ ID:42399, to the nucleotide sequence of VGAM1442 RNA, herein designated VGAM RNA, also designated SEQ ID:4153.

[50170] Another function of VGAM1442 is therefore inhibition of LOC196527 (Accession XM_113743). Accordingly, utilities of VGAM1442 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196527. LOC197358 (Accession XM_113872) is another VGAM1442 host target gene. LOC197358 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC197358, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197358 BINDING SITE, designated SEQ ID:42510, to the nucleotide sequence of VGAM1442 RNA, herein designated VGAM RNA, also designated SEQ ID:4153.

[50171] Another function of VGAM1442 is therefore inhibition of

LOC197358 (Accession XM_113872). Accordingly, utilities of VGAM1442 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197358. LOC200734 (Accession XM_114286) is another VGAM1442 host target gene. LOC200734 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200734, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200734 BINDING SITE, designated SEQ ID:42840, to the nucleotide sequence of VGAM1442 RNA, herein designated VGAM RNA, also designated SEQ ID:4153.

[50172] Another function of VGAM1442 is therefore inhibition of LOC200734 (Accession XM_114286). Accordingly, utilities of VGAM1442 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200734. LOC201164 (Accession XM_113904) is another VGAM1442 host target gene. LOC201164 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC201164, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC201164 BINDING SITE, designated SEQ ID:42530, to the nucleotide sequence of VGAM1442 RNA, herein designated VGAM RNA, also designated SEQ ID:4153.

[50173] Another function of VGAM1442 is therefore inhibition of LOC201164 (Accession XM_113904). Accordingly, utilities of VGAM1442 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201164. LOC254085 (Accession XM_171189) is another VGAM1442 host target gene. LOC254085 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254085, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254085 BINDING SITE, designated SEQ ID:45971, to the nucleotide sequence of VGAM1442 RNA, herein designated VGAM RNA, also designated SEQ ID:4153.

[50174] Another function of VGAM1442 is therefore inhibition of LOC254085 (Accession XM_171189). Accordingly, utilities of VGAM1442 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254085. LOC257117 (Accession XM_171238) is an-

other VGAM1442 host target gene. LOC257117 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257117, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257117 BINDING SITE, designated SEQ ID:46026, to the nucleotide sequence of VGAM1442 RNA, herein designated VGAM RNA, also designated SEQ ID:4153.

[50175] Another function of VGAM1442 is therefore inhibition of LOC257117 (Accession XM_171238). Accordingly, utilities of VGAM1442 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257117. LOC257336 (Accession XM_171216) is another VGAM1442 host target gene. LOC257336 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257336, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257336 BINDING SITE, designated SEQ ID:46003, to the nucleotide sequence of VGAM1442 RNA, herein designated VGAM RNA, also designated SEQ ID:4153.

[50176] Another function of VGAM1442 is therefore inhibition of LOC257336 (Accession XM_171216). Accordingly, utilities of VGAM1442 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257336. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1443 (VGAM1443) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50177] VGAM1443 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1443 was detected is described hereinabove with reference to Figs. 1–8.

[50178] VGAM1443 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pepper Mottle Virus. VGAM1443 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50179] VGAM1443 gene encodes a VGAM1443 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM1443 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1443 precursor RNA is designated SEQ ID:1429, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1429 is located at position 4259 relative to the genome of Pepper Mottle Virus.

- [50180] VGAM1443 precursor RNA folds onto itself, forming VGAM1443 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [50181] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1443 folded precursor RNA into VGAM1443 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1443 RNA is designated SEQ ID:4154, and is provided hereinbelow with reference to the sequence listing part.

[50182] VGAM1443 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1443 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1443 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[50183] VGAM1443 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1443 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1443 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1443 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1443 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[50184] The complementary binding of VGAM1443 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1443 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1443 host target RNA into VGAM1443 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50185] It is appreciated that VGAM1443 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1443 host target genes. The mRNA of each one of this plurality of VGAM1443 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1443 RNA, herein designated VGAM RNA, and which when bound by VGAM1443 RNA causes inhibition of translation of respective one or more VGAM1443 host target proteins.

[50186] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1443 gene, herein designated VGAM GENE, on one or more VGAM1443 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[50187] It is yet further appreciated that a function of VGAM1443 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1443 include diagnosis, prevention and treatment of viral infection by Pepper Mottle Virus. Specific functions, and accordingly utilities, of VGAM1443 correlate with, and may be deduced from, the identity of the host target genes which VGAM1443 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50188] Nucleotide sequences of the VGAM1443 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1443 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1443 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1443 are further described hereinbelow with reference to Table 1.

[50189] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1443 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1443 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[50190] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1443 gene, herein designated VGAM is inhibition of expression of VGAM1443 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1443 correlate with, and may be deduced from, the identity of the target genes which VGAM1443 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[50191] Nucleolar Protein Family A, Member 1 (H/ACA small nucleolar RNPs) (NOLA1, Accession NM_018983) is a VGAM1443 host target gene. NOLA1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NOLA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NOLA1 BINDING SITE, designated SEQ ID:21053, to the nucleotide sequence of VGAM1443 RNA, herein designated VGAM RNA, also designated SEQ ID:4154.

[50192] A function of VGAM1443 is therefore inhibition of Nucleolar Protein Family A, Member 1 (H/ACA small nucleolar RNPs) (NOLA1, Accession NM_018983), a gene which as-

sociates with a only a subset of snrna's and is essential for growth. Accordingly, utilities of VGAM1443 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NOLA1. The function of NOLA1 has been established by previous studies. Small nucleolar RNAs (snoRNAs) of the H/ACA class specify the sites of uridine-to-pseudouridine conversion. The H and ACA motifs are located in the hinge and tail, respectively, of a 2-domain hairpin-hinge-hairpin-tail structure. The uridine conversion process, together with the removal of the spacer region and the 2-prime-O-methylation of ribose groups, which is carried out by snoRNAs of the C/D class, is required for the generation of functional rRNAs. See Tollervey and Kiss (1997) for further information. By cell fractionation and competition assays, Dragon et al. (2000) showed that the 3-prime terminal hairpin of U17 cleavage RNA (see OMIM Ref. No. 603238) and telomerase RNA can form a ribonucleoprotein (RNP) in association with RNAs and 4 proteins (60, 29, 23, and 14 kD) of the H/ACA class. By EST database searching and probing a Burkitt lymphoma cDNA library, Dragon et al. (2000) obtained a cDNA encoding NOLA1, which they called GAR1 after its yeast homolog. The deduced 217-amino acid NOLA1 pro-

tein contains a core domain that is flanked by glycine- and arginine-rich (GAR) domains, which compose half of the sequence. Western blot analysis showed expression of a 28-kD protein, higher than the calculated mass of 23 kD. Immunoprecipitation analysis demonstrated that NOLA1 is a subunit of H/ACA snoRNPs and telomerase, but it is not required for H/ACA protein assembly. Dragon et al. (2000) proposed that the 23- and 14-kD H/ACA proteins represent the human homologs of the yeast Nhp2 (NOLA2; 606470) and Nop10 (NOLA3; 606471) proteins.

[50193] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[50194] Dragon, F.; Pogacic, V.; Filipowicz, W. : In vitro assembly of human H/ACA small nucleolar RNPs reveals unique features of U17 and telomerase RNAs. *Molec. Cell. Biol.* 20: 3037–3048, 2000. ; and

[50195] Tollervey, D.; Kiss, T. : Function and synthesis of small nucleolar RNAs. *Curr. Opin. Cell Biol.* 9: 337–342, 1997.

[50196] Further studies establishing the function and utilities of NOLA1 are found in John Hopkins OMIM database record ID 606468, and in cited publications numbered

4534–4535 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Serine/arginine Repetitive Matrix 1 (SRRM1, Accession NM_005839) is another VGAM1443 host target gene. SRRM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SRRM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SRRM1 BINDING SITE, designated SEQ ID:12449, to the nucleotide sequence of VGAM1443 RNA, herein designated VGAM RNA, also designated SEQ ID:4154.

[50197] Another function of VGAM1443 is therefore inhibition of Serine/arginine Repetitive Matrix 1 (SRRM1, Accession NM_005839). Accordingly, utilities of VGAM1443 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SRRM1. CSL4 (Accession NM_016046) is another VGAM1443 host target gene. CSL4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CSL4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of CSL4 BINDING SITE, designated SEQ ID:18125, to the nucleotide sequence of VGAM1443 RNA, herein designated VGAM RNA, also designated SEQ ID:4154.

[50198] Another function of VGAM1443 is therefore inhibition of CSL4 (Accession NM_016046). Accordingly, utilities of VGAM1443 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSL4. PRMT6 (Accession NM_018137) is another VGAM1443 host target gene. PRMT6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRMT6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRMT6 BINDING SITE, designated SEQ ID:19935, to the nucleotide sequence of VGAM1443 RNA, herein designated VGAM RNA, also designated SEQ ID:4154.

[50199] Another function of VGAM1443 is therefore inhibition of PRMT6 (Accession NM_018137). Accordingly, utilities of VGAM1443 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRMT6. Fig. 1 further provides a conceptual description of a novel

bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1444 (VGAM1444) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50200] VGAM1444 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1444 was detected is described hereinabove with reference to Figs. 1–8.

[50201] VGAM1444 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pepper Mottle Virus. VGAM1444 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50202] VGAM1444 gene encodes a VGAM1444 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1444 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1444 precursor RNA is designated SEQ ID:1430, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1430 is located at position 4768 relative to the

genome of Pepper Mottle Virus.

[50203] VGAM1444 precursor RNA folds onto itself, forming VGAM1444 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50204] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1444 folded precursor RNA into VGAM1444 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM1444 RNA is designated SEQ ID:4155, and is provided hereinbelow with reference to the sequence listing part.

[50205] VGAM1444 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1444 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1444 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[50206] VGAM1444 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1444 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1444 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1444 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1444 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[50207] The complementary binding of VGAM1444 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1444 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1444 host target RNA into VGAM1444 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50208] It is appreciated that VGAM1444 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1444 host target genes. The mRNA of each one of this plurality of VGAM1444 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1444 RNA, herein designated VGAM RNA, and which when bound by VGAM1444 RNA causes inhibition of translation of respective one or more VGAM1444 host target proteins.

[50209] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1444 gene, herein designated VGAM GENE, on one or more VGAM1444 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[50210] It is yet further appreciated that a function of VGAM1444 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1444 include diagnosis, prevention and treatment of viral infection by Pepper Mottle Virus. Specific functions, and accordingly utilities, of VGAM1444

correlate with, and may be deduced from, the identity of the host target genes which VGAM1444 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50211] Nucleotide sequences of the VGAM1444 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1444 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1444 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1444 are further described hereinbelow with reference to Table 1.

[50212] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1444 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1444 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50213] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1444 gene, herein designated VGAM is inhibition of expression of VGAM1444 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1444 correlate with, and may be deduced

from, the identity of the target genes which VGAM1444 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[50214] APG5 Autophagy 5-like (*S. cerevisiae*) (APG5L, Accession NM_004849) is a VGAM1444 host target gene. APG5L BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by APG5L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APG5L BINDING SITE, designated SEQ ID:11263, to the nucleotide sequence of VGAM1444 RNA, herein designated VGAM RNA, also designated SEQ ID:4155.

[50215] A function of VGAM1444 is therefore inhibition of APG5 Autophagy 5-like (*S. cerevisiae*) (APG5L, Accession NM_004849), a gene which conjugates to apg12 and associates with isolation membrane to form cup-shaped isolation membrane and autophagosome. Accordingly, utilities of VGAM1444 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APG5L. The function of APG5L and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove

with reference to VGAM492. Suppressor of Cytokine Signaling 5 (SOCS5, Accession NM_014011) is another VGAM1444 host target gene. SOCS5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SOCS5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SOCS5 BINDING SITE, designated SEQ ID:15226, to the nucleotide sequence of VGAM1444 RNA, herein designated VGAM RNA, also designated SEQ ID:4155.

[50216] Another function of VGAM1444 is therefore inhibition of Suppressor of Cytokine Signaling 5 (SOCS5, Accession NM_014011). Accordingly, utilities of VGAM1444 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SOCS5. X-ray Repair Complementing Defective Repair In Chinese Hamster Cells 2 (XRCC2, Accession NM_005431) is another VGAM1444 host target gene. XRCC2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by XRCC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of XRCC2 BINDING SITE, designated SEQ ID:11902, to the nucleotide sequence of VGAM1444 RNA, herein designated VGAM RNA, also designated SEQ ID:4155.

[50217] Another function of VGAM1444 is therefore inhibition of X-ray Repair Complementing Defective Repair In Chinese Hamster Cells 2 (XRCC2, Accession NM_005431), a gene which involves in the homologous recombination repair (hrr) pathway of double-stranded dna. Accordingly, utilities of VGAM1444 include diagnosis, prevention and treatment of diseases and clinical conditions associated with XRCC2. The function of XRCC2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM241. Chromosome 21 Open Reading Frame 6 (C21orf6, Accession NM_016940) is another VGAM1444 host target gene. C21orf6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C21orf6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C21orf6 BINDING SITE, designated SEQ ID:18856, to the nucleotide

sequence of VGAM1444 RNA, herein designated VGAM RNA, also designated SEQ ID:4155.

[50218] Another function of VGAM1444 is therefore inhibition of Chromosome 21 Open Reading Frame 6 (C21orf6, Accession NM_016940). Accordingly, utilities of VGAM1444 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C21orf6. FLJ11259 (Accession NM_018370) is another VGAM1444 host target gene. FLJ11259 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11259, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11259 BINDING SITE, designated SEQ ID:20389, to the nucleotide sequence of VGAM1444 RNA, herein designated VGAM RNA, also designated SEQ ID:4155.

[50219] Another function of VGAM1444 is therefore inhibition of FLJ11259 (Accession NM_018370). Accordingly, utilities of VGAM1444 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11259. KIAA0514 (Accession NM_014696) is another VGAM1444 host target gene. KIAA0514 BINDING SITE is

HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0514, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0514 BINDING SITE, designated SEQ ID:16210, to the nucleotide sequence of VGAM1444 RNA, herein designated VGAM RNA, also designated SEQ ID:4155.

[50220] Another function of VGAM1444 is therefore inhibition of KIAA0514 (Accession NM_014696). Accordingly, utilities of VGAM1444 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0514. KIAA1317 (Accession XM_098368) is another VGAM1444 host target gene. KIAA1317 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1317, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1317 BINDING SITE, designated SEQ ID:41627, to the nucleotide sequence of VGAM1444 RNA, herein designated VGAM RNA, also designated SEQ ID:4155.

[50221] Another function of VGAM1444 is therefore inhibition of

KIAA1317 (Accession XM_098368). Accordingly, utilities of VGAM1444 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1317. Zinc Finger Protein 300 (ZNF300, Accession NM_052860) is another VGAM1444 host target gene. ZNF300 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ZNF300, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF300 BINDING SITE, designated SEQ ID:27441, to the nucleotide sequence of VGAM1444 RNA, herein designated VGAM RNA, also designated SEQ ID:4155.

[50222] Another function of VGAM1444 is therefore inhibition of Zinc Finger Protein 300 (ZNF300, Accession NM_052860). Accordingly, utilities of VGAM1444 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF300. LOC255018 (Accession XM_173504) is another VGAM1444 host target gene. LOC255018 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255018, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255018 BINDING SITE, designated SEQ ID:46546, to the nucleotide sequence of VGAM1444 RNA, herein designated VGAM RNA, also designated SEQ ID:4155.

[50223] Another function of VGAM1444 is therefore inhibition of LOC255018 (Accession XM_173504). Accordingly, utilities of VGAM1444 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255018. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1445 (VGAM1445) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50224] VGAM1445 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1445 was detected is described hereinabove with reference to Figs. 1–8.

[50225] VGAM1445 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pepper Mottle Virus.

VGAM1445 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50226] VGAM1445 gene encodes a VGAM1445 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1445 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1445 precursor RNA is designated SEQ ID:1431, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1431 is located at position 5583 relative to the genome of Pepper Mottle Virus.

[50227] VGAM1445 precursor RNA folds onto itself, forming VGAM1445 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50228] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM1445 folded precursor RNA into VGAM1445 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1445 RNA is designated SEQ ID:4156, and is provided hereinbelow with reference to the sequence listing part.

[50229] VGAM1445 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1445 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1445 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[50230] VGAM1445 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1445 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1445 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1445 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1445 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[50231] The complementary binding of VGAM1445 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1445 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1445 host target RNA into VGAM1445 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50232] It is appreciated that VGAM1445 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1445 host target genes. The mRNA of each one of this plurality of VGAM1445 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1445 RNA, herein designated VGAM RNA, and which when bound by VGAM1445 RNA causes inhibition of translation of respective one or more VGAM1445 host target proteins.

[50233] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1445 gene, herein designated VGAM GENE, on one or more VGAM1445 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[50234] It is yet further appreciated that a function of VGAM1445 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1445 include diagnosis, prevention and treatment of viral infection by Pepper Mottle Virus. Specific functions, and accordingly utilities, of VGAM1445 correlate with, and may be deduced from, the identity of the host target genes which VGAM1445 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50235] Nucleotide sequences of the VGAM1445 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1445 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1445 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1445 are further described hereinbelow with reference to Table 1.

[50236] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1445 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1445 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50237] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1445 gene, herein designated VGAM is inhibition of expression of VGAM1445 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1445 correlate with, and may be deduced from, the identity of the target genes which VGAM1445 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[50238] Hepatocyte Growth Factor (hepapoietin A; scatter factor) (HGF, Accession XM_168542) is a VGAM1445 host target gene. HGF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HGF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HGF BINDING SITE, designated SEQ ID:45225,

to the nucleotide sequence of VGAM1445 RNA, herein designated VGAM RNA, also designated SEQ ID:4156.

[50239] A function of VGAM1445 is therefore inhibition of Hepatocyte Growth Factor (hepapoietin A; scatter factor) (HGF, Accession XM_168542), a gene which may be required for normal embryonic development; strongly similar to murine Hgf, has kringle domains. Accordingly, utilities of VGAM1445 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HGF. The function of HGF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM174.KIAA0218 (Accession NM_014760) is another VGAM1445 host target gene. KIAA0218 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0218, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0218 BINDING SITE, designated SEQ ID:16515, to the nucleotide sequence of VGAM1445 RNA, herein designated VGAM RNA, also designated SEQ ID:4156.

[50240] Another function of VGAM1445 is therefore inhibition of

KIAA0218 (Accession NM_014760). Accordingly, utilities of VGAM1445 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0218. LOC153688 (Accession XM_098416) is another VGAM1445 host target gene. LOC153688 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153688, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153688 BINDING SITE, designated SEQ ID:41657, to the nucleotide sequence of VGAM1445 RNA, herein designated VGAM RNA, also designated SEQ ID:4156.

[50241] Another function of VGAM1445 is therefore inhibition of LOC153688 (Accession XM_098416). Accordingly, utilities of VGAM1445 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153688. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1446 (VGAM1446) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[50242] VGAM1446 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1446 was detected is described hereinabove with reference to Figs. 1–8.

[50243] VGAM1446 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pepper Mottle Virus. VGAM1446 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50244] VGAM1446 gene encodes a VGAM1446 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1446 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1446 precursor RNA is designated SEQ ID:1432, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1432 is located at position 3107 relative to the genome of Pepper Mottle Virus.

[50245] VGAM1446 precursor RNA folds onto itself, forming VGAM1446 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two–

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50246] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1446 folded precursor RNA into VGAM1446 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1446 RNA is designated SEQ ID:4157, and is provided hereinbelow with reference to the sequence listing part.

[50247] VGAM1446 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1446 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1446 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[50248] VGAM1446 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1446 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1446 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1446 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1446 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[50249] The complementary binding of VGAM1446 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1446 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1446 host target RNA into VGAM1446 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50250] It is appreciated that VGAM1446 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1446 host target genes. The mRNA of each one of this plurality of VGAM1446 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1446 RNA, herein designated VGAM RNA, and which when bound by VGAM1446 RNA causes inhibition of translation of respective one or more VGAM1446 host target proteins.

[50251] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1446 gene, herein designated VGAM GENE, on one

or more VGAM1446 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[50252] It is yet further appreciated that a function of VGAM1446 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1446 include diagnosis, prevention and treatment of viral infection by Pepper Mottle Virus. Specific functions, and accordingly utilities, of VGAM1446 correlate with, and may be deduced from, the identity of the host target genes which VGAM1446 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50253] Nucleotide sequences of the VGAM1446 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1446 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1446 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1446 are further described hereinbelow with reference to Table 1.

[50254] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1446 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1446 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50255] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1446 gene, herein designated VGAM is inhibition of expression of VGAM1446 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1446 correlate with, and may be deduced from, the identity of the target genes which VGAM1446 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[50256] Fibulin 5 (FBLN5, Accession NM_006329) is a VGAM1446

host target gene. FBLN5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FBLN5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBLN5 BINDING SITE, designated SEQ ID:13024, to the nucleotide sequence of VGAM1446 RNA, herein designated VGAM RNA, also designated SEQ ID:4157.

[50257] A function of VGAM1446 is therefore inhibition of Fibulin 5 (FBLN5, Accession NM_006329), a gene which promotes adhesion of endothelial cells through interaction of integrins and the rgd motif. Accordingly, utilities of VGAM1446 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBLN5. The function of FBLN5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1127. Guanine Nucleotide Binding Protein (G protein), Alpha Inhibiting Activity Polypeptide 3 (GNAI3, Accession NM_006496) is another VGAM1446 host target gene. GNAI3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

GNAI3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GNAI3 BINDING SITE, designated SEQ ID:13238, to the nucleotide sequence of VGAM1446 RNA, herein designated VGAM RNA, also designated SEQ ID:4157.

[50258] Another function of VGAM1446 is therefore inhibition of Guanine Nucleotide Binding Protein (G protein), Alpha Inhibiting Activity Polypeptide 3 (GNAI3, Accession NM_006496), a gene which stimulates receptor regulated K⁺-channels. Accordingly, utilities of VGAM1446 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNAI3. The function of GNAI3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM45. Interleukin Enhancer Binding Factor 1 (ILF1, Accession NM_004514) is another VGAM1446 host target gene. ILF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ILF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Ta-

ble 2 illustrates the complementarity of the nucleotide sequences of ILF1 BINDING SITE, designated SEQ ID:10843, to the nucleotide sequence of VGAM1446 RNA, herein designated VGAM RNA, also designated SEQ ID:4157.

[50259] Another function of VGAM1446 is therefore inhibition of Interleukin Enhancer Binding Factor 1 (ILF1, Accession NM_004514), a gene which binds to nfat-like motifs (purine-rich) in the hiv-1 long terminal repeat and in the il-2 promoter. Accordingly, utilities of VGAM1446 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ILF1. The function of ILF1 has been established by previous studies. Li et al. (1991) cloned a cellular factor, known as ILF (for interleukin enhancer-binding factor), from both HeLa and Jurkat cDNA libraries. ILF binds to purine-rich regulatory motifs in the HIV-1 LTR (long terminal repeat) and to interleukin-2 promoter (IL2; 147680). Further analysis of the ILF gene demonstrated the existence of 2 mRNA species, both of which encode proteins containing the 'forkhead' DNA binding domain (Li et al., 1992). By analysis of a panel of mouse/human somatic cell hybrids followed by radioactive in situ hybridization, Li et al. (1992) demonstrated that the ILF gene is located on 17q25, which is a site of

chromosomal translocations in some cases of human acute myelogenous leukemia. HTLF (OMIM Ref. No. 143089) is another 'forkhead' domain DNA binding protein, which is located on 2p22-p16

[50260] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[50261] Li, C.; Lai, C.; Sigman, D. S.; Gaynor, R. B. : Cloning of a cellular factor, interleukin binding factor, that binds to NFAT-like motifs in the human immunodeficiency virus long terminal repeat. Proc. Nat. Acad. Sci. 88: 7739-7743, 1991. ; and

[50262] Li, C.; Lysis, A. J.; Sparkes, R.; Nirula, A.; Gaynor, R. : Characterization and chromosomal mapping of the gene encoding the cellular DNA binding protein ILF. Genomics 13: 665-671, 1992.

[50263] Further studies establishing the function and utilities of ILF1 are found in John Hopkins OMIM database record ID 147685, and in cited publications numbered 5246-5247 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Membrane Protein, Palmitoylated 2 (MAGUK p55 subfamily member 2) (MPP2, Accession XM_008355) is another VGAM1446 host target

gene. MPP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MPP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MPP2 BINDING SITE, designated SEQ ID:30080, to the nucleotide sequence of VGAM1446 RNA, herein designated VGAM RNA, also designated SEQ ID:4157.

[50264] Another function of VGAM1446 is therefore inhibition of Membrane Protein, Palmitoylated 2 (MAGUK p55 subfamily member 2) (MPP2, Accession XM_008355). Accordingly, utilities of VGAM1446 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MPP2. Myotubular Myopathy 1 (MTM1, Accession NM_000252) is another VGAM1446 host target gene. MTM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MTM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MTM1 BINDING SITE, designated SEQ ID:5790, to the nucleotide sequence of VGAM1446 RNA, herein designated VGAM RNA, also designated SEQ ID:4157.

[50265] Another function of VGAM1446 is therefore inhibition of Myotubular Myopathy 1 (MTM1, Accession NM_000252). Accordingly, utilities of VGAM1446 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MTM1. Dynein, Cytoplasmic, Light Intermediate Polypeptide 1 (DNCLI1, Accession XM_003119) is another VGAM1446 host target gene. DNCLI1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DNCLI1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DNCLI1 BINDING SITE, designated SEQ ID:29927, to the nucleotide sequence of VGAM1446 RNA, herein designated VGAM RNA, also designated SEQ ID:4157.

[50266] Another function of VGAM1446 is therefore inhibition of Dynein, Cytoplasmic, Light Intermediate Polypeptide 1 (DNCLI1, Accession XM_003119). Accordingly, utilities of VGAM1446 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNCLI1. F-box Only Protein 21 (FBXO21, Accession NM_033624) is another VGAM1446 host target gene.

FBXO21 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FBXO21, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBXO21 BINDING SITE, designated SEQ ID:27325, to the nucleotide sequence of VGAM1446 RNA, herein designated VGAM RNA, also designated SEQ ID:4157.

[50267] Another function of VGAM1446 is therefore inhibition of F-box Only Protein 21 (FBXO21, Accession NM_033624). Accordingly, utilities of VGAM1446 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXO21. KIAA1615 (Accession XM_044021) is another VGAM1446 host target gene. KIAA1615 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1615, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1615 BINDING SITE, designated SEQ ID:34086, to the nucleotide sequence of VGAM1446 RNA, herein designated VGAM RNA, also designated SEQ

ID:4157.

[50268] Another function of VGAM1446 is therefore inhibition of KIAA1615 (Accession XM_044021). Accordingly, utilities of VGAM1446 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1615. Paternally Expressed 10 (PEG10, Accession NM_015068) is another VGAM1446 host target gene. PEG10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PEG10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PEG10 BINDING SITE, designated SEQ ID:17432, to the nucleotide sequence of VGAM1446 RNA, herein designated VGAM RNA, also designated SEQ ID:4157.

[50269] Another function of VGAM1446 is therefore inhibition of Paternally Expressed 10 (PEG10, Accession NM_015068). Accordingly, utilities of VGAM1446 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PEG10. LOC155435 (Accession XM_088257) is another VGAM1446 host target gene. LOC155435 BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by LOC155435, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155435 BINDING SITE, designated SEQ ID:39568, to the nucleotide sequence of VGAM1446 RNA, herein designated VGAM RNA, also designated SEQ ID:4157.

[50270] Another function of VGAM1446 is therefore inhibition of LOC155435 (Accession XM_088257). Accordingly, utilities of VGAM1446 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155435. LOC160717 (Accession XM_090457) is another VGAM1446 host target gene. LOC160717 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC160717, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC160717 BINDING SITE, designated SEQ ID:40008, to the nucleotide sequence of VGAM1446 RNA, herein designated VGAM RNA, also designated SEQ ID:4157.

[50271] Another function of VGAM1446 is therefore inhibition of

LOC160717 (Accession XM_090457). Accordingly, utilities of VGAM1446 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC160717. LOC222865 (Accession XM_167242) is another VGAM1446 host target gene. LOC222865 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC222865, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222865 BINDING SITE, designated SEQ ID:44621, to the nucleotide sequence of VGAM1446 RNA, herein designated VGAM RNA, also designated SEQ ID:4157.

[50272] Another function of VGAM1446 is therefore inhibition of LOC222865 (Accession XM_167242). Accordingly, utilities of VGAM1446 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222865. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1447 (VGAM1447) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[50273] VGAM1447 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1447 was detected is described hereinabove with reference to Figs. 1–8.

[50274] VGAM1447 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pepper Mottle Virus. VGAM1447 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50275] VGAM1447 gene encodes a VGAM1447 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1447 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1447 precursor RNA is designated SEQ ID:1433, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1433 is located at position 1681 relative to the genome of Pepper Mottle Virus.

[50276] VGAM1447 precursor RNA folds onto itself, forming VGAM1447 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two–

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50277] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1447 folded precursor RNA into VGAM1447 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1447 RNA is designated SEQ ID:4158, and is provided hereinbelow with reference to the sequence listing part.

[50278] VGAM1447 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1447 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1447 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[50279] VGAM1447 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1447 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1447 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1447 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1447 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[50280] The complementary binding of VGAM1447 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1447 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1447 host target RNA into VGAM1447 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50281] It is appreciated that VGAM1447 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1447 host target genes. The mRNA of each one of this plurality of VGAM1447 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1447 RNA, herein designated VGAM RNA, and which when bound by VGAM1447 RNA causes inhibition of translation of respective one or more VGAM1447 host target proteins.

[50282] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1447 gene, herein designated VGAM GENE, on one

or more VGAM1447 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[50283] It is yet further appreciated that a function of VGAM1447 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1447 include diagnosis, prevention and treatment of viral infection by Pepper Mottle Virus. Specific functions, and accordingly utilities, of VGAM1447 correlate with, and may be deduced from, the identity of the host target genes which VGAM1447 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50284] Nucleotide sequences of the VGAM1447 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1447 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1447 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1447 are further described hereinbelow with reference to Table 1.

[50285] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1447 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1447 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50286] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1447 gene, herein designated VGAM is inhibition of expression of VGAM1447 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1447 correlate with, and may be deduced from, the identity of the target genes which VGAM1447 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[50287] A Disintegrin-like and Metalloprotease (reprolysin type)

with Thrombospondin Type 1 Motif, 1 (ADAMTS1, Accession NM_006988) is a VGAM1447 host target gene.

ADAMTS1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ADAMTS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAMTS1 BINDING SITE, designated SEQ ID:13853, to the nucleotide sequence of VGAM1447 RNA, herein designated VGAM RNA, also designated SEQ ID:4158.

[50288] A function of VGAM1447 is therefore inhibition of A Disintegrin-like and Metalloprotease (reprolysin type) with Thrombospondin Type 1 Motif, 1 (ADAMTS1, Accession NM_006988). Accordingly, utilities of VGAM1447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAMTS1. Aquaporin 6, Kidney Specific (AQP6, Accession NM_053286) is another VGAM1447 host target gene. AQP6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AQP6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of AQP6 BINDING SITE, designated SEQ ID:27618, to the nucleotide sequence of VGAM1447 RNA, herein designated VGAM RNA, also designated SEQ ID:4158.

[50289] Another function of VGAM1447 is therefore inhibition of Aquaporin 6, Kidney Specific (AQP6, Accession NM_053286), a gene which participates in distinct physiologic function such as glomerular filtration, tubular endocytosis, and acid-base metabolism. Accordingly, utilities of VGAM1447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AQP6. The function of AQP6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM340. Dystrophin (muscular dystrophy, Duchenne and Becker types) (DMD, Accession NM_004007) is another VGAM1447 host target gene. DMD BINDING SITE1 and DMD BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DMD, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DMD BINDING SITE1 and DMD

BINDING SITE2, designated SEQ ID:10160 and SEQ ID:10174 respectively, to the nucleotide sequence of VGAM1447 RNA, herein designated VGAM RNA, also designated SEQ ID:4158.

[50290] Another function of VGAM1447 is therefore inhibition of Dystrophin (muscular dystrophy, Duchenne and Becker types) (DMD, Accession NM_004007), a gene which muscular dystrophy . Accordingly, utilities of VGAM1447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DMD. The function of DMD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM218.Epidermal Growth Factor Receptor (erythroblastic leukemia viral (v-erb-b) Oncogene Homolog, Avian) (EGFR, Accession NM_005228) is another VGAM1447 host target gene. EGFR BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EGFR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGFR BINDING SITE, designated SEQ ID:11727, to the nucleotide sequence of

VGAM1447 RNA, herein designated VGAM RNA, also designated SEQ ID:4158.

[50291] Another function of VGAM1447 is therefore inhibition of Epidermal Growth Factor Receptor (erythroblastic leukemia viral (v-erb-b) Oncogene Homolog, Avian) (EGFR, Accession NM_005228), a gene which is a receptor for egf, but also for other members of the egf family. Accordingly, utilities of VGAM1447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGFR. The function of EGFR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM229. Fatty-acid-Coenzyme A Ligase, Long-chain 5 (FACL5, Accession XM_034424) is another VGAM1447 host target gene. FACL5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FACL5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FACL5 BINDING SITE, designated SEQ ID:32108, to the nucleotide sequence of VGAM1447 RNA, herein designated VGAM RNA, also designated SEQ ID:4158.

[50292] Another function of VGAM1447 is therefore inhibition of Fatty-acid-Coenzyme A Ligase, Long-chain 5 (FACL5, Accession XM_034424), a gene which may be involved in fatty acid metabolism; contains an AMP-binding domain. Accordingly, utilities of VGAM1447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FACL5. The function of FACL5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM357. GRB2-associated Binding Protein 2 (GAB2, Accession NM_080491) is another VGAM1447 host target gene. GAB2 BINDING SITE1 and GAB2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by GAB2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GAB2 BINDING SITE1 and GAB2 BINDING SITE2, designated SEQ ID:27843 and SEQ ID:14647 respectively, to the nucleotide sequence of VGAM1447 RNA, herein designated VGAM RNA, also designated SEQ ID:4158.

[50293] Another function of VGAM1447 is therefore inhibition of

GRB2-associated Binding Protein 2 (GAB2, Accession NM_080491), a gene which act as adapters for transmitting various signals. Accordingly, utilities of VGAM1447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAB2. The function of GAB2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM53.IMP (inosine monophosphate) Dehydrogenase 1 (IMPDH1, Accession NM_000883) is another VGAM1447 host target gene. IMPDH1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IMPDH1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IMPDH1 BINDING SITE, designated SEQ ID:6578, to the nucleotide sequence of VGAM1447 RNA, herein designated VGAM RNA, also designated SEQ ID:4158.

[50294] Another function of VGAM1447 is therefore inhibition of IMP (inosine monophosphate) Dehydrogenase 1 (IMPDH1, Accession NM_000883). Accordingly, utilities of VGAM1447 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with IM-PDH1. Potassium Inwardly-rectifying Channel, Subfamily J, Member 16 (KCNJ16, Accession NM_018658) is another VGAM1447 host target gene. KCNJ16 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KCNJ16, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNJ16 BINDING SITE, designated SEQ ID:20730, to the nucleotide sequence of VGAM1447 RNA, herein designated VGAM RNA, also designated SEQ ID:4158.

[50295] Another function of VGAM1447 is therefore inhibition of Potassium Inwardly-rectifying Channel, Subfamily J, Member 16 (KCNJ16, Accession NM_018658). Accordingly, utilities of VGAM1447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNJ16. N-acetylgalactosaminidase, Alpha- (NAGA, Accession NM_000262) is another VGAM1447 host target gene. NAGA BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NAGA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Ta-

ble 2 illustrates the complementarity of the nucleotide sequences of NAGA BINDING SITE, designated SEQ ID:5801, to the nucleotide sequence of VGAM1447 RNA, herein designated VGAM RNA, also designated SEQ ID:4158.

[50296] Another function of VGAM1447 is therefore inhibition of N-acetylgalactosaminidase, Alpha- (NAGA, Accession NM_000262). Accordingly, utilities of VGAM1447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NAGA. Nuclear Receptor Interacting Protein 1 (NRIP1, Accession XM_009699) is another VGAM1447 host target gene. NRIP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NRIP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NRIP1 BINDING SITE, designated SEQ ID:30120, to the nucleotide sequence of VGAM1447 RNA, herein designated VGAM RNA, also designated SEQ ID:4158.

[50297] Another function of VGAM1447 is therefore inhibition of Nuclear Receptor Interacting Protein 1 (NRIP1, Accession XM_009699), a gene which modulates transcriptional activation by the estrogen receptor. Accordingly, utilities of

VGAM1447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NRIP1. The function of NRIP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM276. POU Domain, Class 4, Transcription Factor 1 (POU4F1, Accession NM_006237) is another VGAM1447 host target gene. POU4F1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by POU4F1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POU4F1 BINDING SITE, designated SEQ ID:12901, to the nucleotide sequence of VGAM1447 RNA, herein designated VGAM RNA, also designated SEQ ID:4158.

[50298] Another function of VGAM1447 is therefore inhibition of POU Domain, Class 4, Transcription Factor 1 (POU4F1, Accession NM_006237), a gene which plays a role in the regulation of specific gene expression within a subset of neuronal lineages. Accordingly, utilities of VGAM1447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POU4F1. The function

of POU4F1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1026. Spondin 1, (f-spondin) Extracellular Matrix Protein (SPON1, Accession XM_031184) is another VGAM1447 host target gene. SPON1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SPON1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPON1 BINDING SITE, designated SEQ ID:31299, to the nucleotide sequence of VGAM1447 RNA, herein designated VGAM RNA, also designated SEQ ID:4158.

[50299] Another function of VGAM1447 is therefore inhibition of Spondin 1, (f-spondin) Extracellular Matrix Protein (SPON1, Accession XM_031184). Accordingly, utilities of VGAM1447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPON1. BMF (Accession NM_033503) is another VGAM1447 host target gene. BMF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BMF, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BMF BINDING SITE, designated SEQ ID:27277, to the nucleotide sequence of VGAM1447 RNA, herein designated VGAM RNA, also designated SEQ ID:4158.

[50300] Another function of VGAM1447 is therefore inhibition of BMF (Accession NM_033503). Accordingly, utilities of VGAM1447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BMF. Caspase 9, Apoptosis-related Cysteine Protease (CASP9, Accession NM_001229) is another VGAM1447 host target gene. CASP9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CASP9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CASP9 BINDING SITE, designated SEQ ID:6901, to the nucleotide sequence of VGAM1447 RNA, herein designated VGAM RNA, also designated SEQ ID:4158.

[50301] Another function of VGAM1447 is therefore inhibition of Caspase 9, Apoptosis-related Cysteine Protease (CASP9,

Accession NM_001229). Accordingly, utilities of VGAM1447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CASP9. Cat Eye Syndrome Chromosome Region, Candidate 7 (CECR7, Accession XM_086803) is another VGAM1447 host target gene. CECR7 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CECR7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CECR7 BINDING SITE, designated SEQ ID:38881, to the nucleotide sequence of VGAM1447 RNA, herein designated VGAM RNA, also designated SEQ ID:4158.

[50302] Another function of VGAM1447 is therefore inhibition of Cat Eye Syndrome Chromosome Region, Candidate 7 (CECR7, Accession XM_086803). Accordingly, utilities of VGAM1447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CECR7. C-type (calcium dependent, carbohydrate-recognition domain) Lectin, Superfamily Member 9 (CLECSF9, Accession NM_014358) is another VGAM1447 host target gene. CLECSF9 BINDING SITE is HOST TARGET binding site found

in the 5' untranslated region of mRNA encoded by CLECSF9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLECSF9 BINDING SITE, designated SEQ ID:15688, to the nucleotide sequence of VGAM1447 RNA, herein designated VGAM RNA, also designated SEQ ID:4158.

[50303] Another function of VGAM1447 is therefore inhibition of C-type (calcium dependent, carbohydrate-recognition domain) Lectin, Superfamily Member 9 (CLECSF9, Accession NM_014358). Accordingly, utilities of VGAM1447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLECSF9. CCR4-NOT Transcription Complex, Subunit 8 (CNOT8, Accession NM_004779) is another VGAM1447 host target gene. CNOT8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CNOT8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNOT8 BINDING SITE, designated SEQ ID:11177, to the nucleotide sequence of VGAM1447 RNA,

herein designated VGAM RNA, also designated SEQ ID:4158.

[50304] Another function of VGAM1447 is therefore inhibition of CCR4–NOT Transcription Complex, Subunit 8 (CNOT8, Accession NM_004779). Accordingly, utilities of VGAM1447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNOT8. DCOHM (Accession NM_032151) is another VGAM1447 host target gene. DCOHM BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DCOHM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DCOHM BINDING SITE, designated SEQ ID:25850, to the nucleotide sequence of VGAM1447 RNA, herein designated VGAM RNA, also designated SEQ ID:4158.

[50305] Another function of VGAM1447 is therefore inhibition of DCOHM (Accession NM_032151). Accordingly, utilities of VGAM1447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DCOHM. DEAD/H (Asp–Glu–Ala–Asp/His) Box Polypeptide 17, 72kDa (DDX17, Accession NM_030881) is another

VGAM1447 host target gene. DDX17 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DDX17, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDX17 BINDING SITE, designated SEQ ID:25155, to the nucleotide sequence of VGAM1447 RNA, herein designated VGAM RNA, also designated SEQ ID:4158.

[50306] Another function of VGAM1447 is therefore inhibition of DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 17, 72kDa (DDX17, Accession NM_030881). Accordingly, utilities of VGAM1447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDX17. FLJ10242 (Accession NM_018036) is another VGAM1447 host target gene. FLJ10242 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ10242, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10242 BINDING SITE, designated SEQ ID:19777, to the nucleotide sequence of VGAM1447 RNA, herein designated VGAM

RNA, also designated SEQ ID:4158.

[50307] Another function of VGAM1447 is therefore inhibition of FLJ10242 (Accession NM_018036). Accordingly, utilities of VGAM1447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10242. FLJ10936 (Accession NM_018279) is another VGAM1447 host target gene. FLJ10936 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10936, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10936 BINDING SITE, designated SEQ ID:20271, to the nucleotide sequence of VGAM1447 RNA, herein designated VGAM RNA, also designated SEQ ID:4158.

[50308] Another function of VGAM1447 is therefore inhibition of FLJ10936 (Accession NM_018279). Accordingly, utilities of VGAM1447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10936. FLJ13614 (Accession NM_139076) is another VGAM1447 host target gene. FLJ13614 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13614, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13614 BINDING SITE, designated SEQ ID:29149, to the nucleotide sequence of VGAM1447 RNA, herein designated VGAM RNA, also designated SEQ ID:4158.

[50309] Another function of VGAM1447 is therefore inhibition of FLJ13614 (Accession NM_139076). Accordingly, utilities of VGAM1447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13614. FLJ13881 (Accession NM_024729) is another VGAM1447 host target gene. FLJ13881 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13881, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13881 BINDING SITE, designated SEQ ID:24067, to the nucleotide sequence of VGAM1447 RNA, herein designated VGAM RNA, also designated SEQ ID:4158.

[50310] Another function of VGAM1447 is therefore inhibition of FLJ13881 (Accession NM_024729). Accordingly, utilities of VGAM1447 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ13881. FLJ14082 (Accession NM_025024) is another VGAM1447 host target gene. FLJ14082 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ14082, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14082 BINDING SITE, designated SEQ ID:24609, to the nucleotide sequence of VGAM1447 RNA, herein designated VGAM RNA, also designated SEQ ID:4158.

[50311] Another function of VGAM1447 is therefore inhibition of FLJ14082 (Accession NM_025024). Accordingly, utilities of VGAM1447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14082. FLJ14117 (Accession NM_022777) is another VGAM1447 host target gene. FLJ14117 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14117, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14117 BINDING SITE, designated SEQ ID:23049, to the nucleotide

sequence of VGAM1447 RNA, herein designated VGAM RNA, also designated SEQ ID:4158.

[50312] Another function of VGAM1447 is therefore inhibition of FLJ14117 (Accession NM_022777). Accordingly, utilities of VGAM1447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14117. FLJ21106 (Accession NM_025097) is another VGAM1447 host target gene. FLJ21106 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ21106, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21106 BINDING SITE, designated SEQ ID:24734, to the nucleotide sequence of VGAM1447 RNA, herein designated VGAM RNA, also designated SEQ ID:4158.

[50313] Another function of VGAM1447 is therefore inhibition of FLJ21106 (Accession NM_025097). Accordingly, utilities of VGAM1447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21106. FLJ32389 (Accession NM_144617) is another VGAM1447 host target gene. FLJ32389 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by FLJ32389, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ32389 BINDING SITE, designated SEQ ID:29435, to the nucleotide sequence of VGAM1447 RNA, herein designated VGAM RNA, also designated SEQ ID:4158.

[50314] Another function of VGAM1447 is therefore inhibition of FLJ32389 (Accession NM_144617). Accordingly, utilities of VGAM1447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32389. UDP-N-acetyl-alpha-D-galactosamine:polypeptide N-acetylgalactosaminyltransferase 12 (GalNAc-T12) (GALNT12, Accession NM_024642) is another VGAM1447 host target gene. GALNT12 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GALNT12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GALNT12 BINDING SITE, designated SEQ ID:23927, to the nucleotide sequence of VGAM1447 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4158.

[50315] Another function of VGAM1447 is therefore inhibition of UDP-N-acetyl-alpha-D-galactosamine:polypeptide N-acetylgalactosaminyltransferase 12 (GalNAc-T12) (GALNT12, Accession NM_024642). Accordingly, utilities of VGAM1447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GALNT12. HPIP (Accession NM_020524) is another VGAM1447 host target gene. HPIP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HPIP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HPIP BINDING SITE, designated SEQ ID:21736, to the nucleotide sequence of VGAM1447 RNA, herein designated VGAM RNA, also designated SEQ ID:4158.

[50316] Another function of VGAM1447 is therefore inhibition of HPIP (Accession NM_020524). Accordingly, utilities of VGAM1447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HPIP. HRIHFB2122 (Accession NM_007032) is another VGAM1447 host target gene. HRIHFB2122 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HRIHFB2122, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HRIHFB2122 BINDING SITE, designated SEQ ID:13899, to the nucleotide sequence of VGAM1447 RNA, herein designated VGAM RNA, also designated SEQ ID:4158.

[50317] Another function of VGAM1447 is therefore inhibition of HRIHFB2122 (Accession NM_007032). Accordingly, utilities of VGAM1447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HRIHFB2122. KIAA0057 (Accession NM_012288) is another VGAM1447 host target gene. KIAA0057 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0057, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0057 BINDING SITE, designated SEQ ID:14626, to the nucleotide sequence of VGAM1447 RNA, herein designated VGAM RNA, also designated SEQ ID:4158.

[50318] Another function of VGAM1447 is therefore inhibition of

KIAA0057 (Accession NM_012288). Accordingly, utilities of VGAM1447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0057. KIAA0194 (Accession XM_038362) is another VGAM1447 host target gene. KIAA0194 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0194, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0194 BINDING SITE, designated SEQ ID:32823, to the nucleotide sequence of VGAM1447 RNA, herein designated VGAM RNA, also designated SEQ ID:4158.

[50319] Another function of VGAM1447 is therefore inhibition of KIAA0194 (Accession XM_038362). Accordingly, utilities of VGAM1447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0194. KIAA0444 (Accession XM_030999) is another VGAM1447 host target gene. KIAA0444 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0444, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA0444 BINDING SITE, designated SEQ ID:31246, to the nucleotide sequence of VGAM1447 RNA, herein designated VGAM RNA, also designated SEQ ID:4158.

[50320] Another function of VGAM1447 is therefore inhibition of KIAA0444 (Accession XM_030999). Accordingly, utilities of VGAM1447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0444. KIAA0470 (Accession NM_014812) is another VGAM1447 host target gene. KIAA0470 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0470, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0470 BINDING SITE, designated SEQ ID:16777, to the nucleotide sequence of VGAM1447 RNA, herein designated VGAM RNA, also designated SEQ ID:4158.

[50321] Another function of VGAM1447 is therefore inhibition of KIAA0470 (Accession NM_014812). Accordingly, utilities of VGAM1447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0470. KIAA0663 (Accession NM_014827) is another

VGAM1447 host target gene. KIAA0663 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0663, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0663 BINDING SITE, designated SEQ ID:16815, to the nucleotide sequence of VGAM1447 RNA, herein designated VGAM RNA, also designated SEQ ID:4158.

[50322] Another function of VGAM1447 is therefore inhibition of KIAA0663 (Accession NM_014827). Accordingly, utilities of VGAM1447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0663. KIAA1155 (Accession XM_030864) is another VGAM1447 host target gene. KIAA1155 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1155, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1155 BINDING SITE, designated SEQ ID:31200, to the nucleotide sequence of VGAM1447 RNA, herein designated VGAM RNA, also designated SEQ ID:4158.

[50323] Another function of VGAM1447 is therefore inhibition of KIAA1155 (Accession XM_030864). Accordingly, utilities of VGAM1447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1155. KIAA1416 (Accession XM_098762) is another VGAM1447 host target gene. KIAA1416 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1416, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1416 BINDING SITE, designated SEQ ID:41803, to the nucleotide sequence of VGAM1447 RNA, herein designated VGAM RNA, also designated SEQ ID:4158.

[50324] Another function of VGAM1447 is therefore inhibition of KIAA1416 (Accession XM_098762). Accordingly, utilities of VGAM1447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1416. KIAA1656 (Accession XM_038022) is another VGAM1447 host target gene. KIAA1656 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1656, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1656 BINDING SITE, designated SEQ ID:32729, to the nucleotide sequence of VGAM1447 RNA, herein designated VGAM RNA, also designated SEQ ID:4158.

[50325] Another function of VGAM1447 is therefore inhibition of KIAA1656 (Accession XM_038022). Accordingly, utilities of VGAM1447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1656. MGC20253 (Accession NM_144583) is another VGAM1447 host target gene. MGC20253 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC20253, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC20253 BINDING SITE, designated SEQ ID:29398, to the nucleotide sequence of VGAM1447 RNA, herein designated VGAM RNA, also designated SEQ ID:4158.

[50326] Another function of VGAM1447 is therefore inhibition of MGC20253 (Accession NM_144583). Accordingly, utilities of VGAM1447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

MGC20253. MGC4655 (Accession NM_033309) is another VGAM1447 host target gene. MGC4655 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC4655, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4655 BINDING SITE, designated SEQ ID:27149, to the nucleotide sequence of VGAM1447 RNA, herein designated VGAM RNA, also designated SEQ ID:4158.

[50327] Another function of VGAM1447 is therefore inhibition of MGC4655 (Accession NM_033309). Accordingly, utilities of VGAM1447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4655. Solute Carrier Family 39 (zinc transporter), Member 3 (SLC39A3, Accession NM_144564) is another VGAM1447 host target gene. SLC39A3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC39A3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC39A3 BINDING SITE, designated SEQ ID:29358, to the nucleotide

sequence of VGAM1447 RNA, herein designated VGAM RNA, also designated SEQ ID:4158.

[50328] Another function of VGAM1447 is therefore inhibition of Solute Carrier Family 39 (zinc transporter), Member 3 (SLC39A3, Accession NM_144564). Accordingly, utilities of VGAM1447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC39A3. Synaptosomal-associated Protein, 29kDa (SNAP29, Accession NM_004782) is another VGAM1447 host target gene. SNAP29 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SNAP29, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNAP29 BINDING SITE, designated SEQ ID:11186, to the nucleotide sequence of VGAM1447 RNA, herein designated VGAM RNA, also designated SEQ ID:4158.

[50329] Another function of VGAM1447 is therefore inhibition of Synaptosomal-associated Protein, 29kDa (SNAP29, Accession NM_004782). Accordingly, utilities of VGAM1447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNAP29. Serum Re-

sponse Factor (c-fos serum response element-binding transcription factor) (SRF, Accession NM_003131) is another VGAM1447 host target gene. SRF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SRF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SRF BINDING SITE, designated SEQ ID:9105, to the nucleotide sequence of VGAM1447 RNA, herein designated VGAM RNA, also designated SEQ ID:4158.

[50330] Another function of VGAM1447 is therefore inhibition of Serum Response Factor (c-fos serum response element-binding transcription factor) (SRF, Accession NM_003131). Accordingly, utilities of VGAM1447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SRF. Synovial Sarcoma Translocation Gene On Chromosome 18-like 1 (SS18L1, Accession XM_037202) is another VGAM1447 host target gene. SS18L1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SS18L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of SS18L1 BINDING SITE, designated SEQ ID:32561, to the nucleotide sequence of VGAM1447 RNA, herein designated VGAM RNA, also designated SEQ ID:4158.

[50331] Another function of VGAM1447 is therefore inhibition of Synovial Sarcoma Translocation Gene On Chromosome 18-like 1 (SS18L1, Accession XM_037202). Accordingly, utilities of VGAM1447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SS18L1. SYNE-1 (Accession NM_015293) is another VGAM1447 host target gene. SYNE-1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SYNE-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYNE-1 BINDING SITE, designated SEQ ID:17614, to the nucleotide sequence of VGAM1447 RNA, herein designated VGAM RNA, also designated SEQ ID:4158.

[50332] Another function of VGAM1447 is therefore inhibition of SYNE-1 (Accession NM_015293). Accordingly, utilities of VGAM1447 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with SYNE-1. TED (Accession NM_015686) is another VGAM1447 host target gene. TED BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TED, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TED BINDING SITE, designated SEQ ID:17913, to the nucleotide sequence of VGAM1447 RNA, herein designated VGAM RNA, also designated SEQ ID:4158.

[50333] Another function of VGAM1447 is therefore inhibition of TED (Accession NM_015686). Accordingly, utilities of VGAM1447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TED. Unc-5 Homolog D (C. elegans) (UNC5D, Accession NM_080872) is another VGAM1447 host target gene. UNC5D BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by UNC5D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UNC5D BINDING SITE, designated SEQ

ID:28115, to the nucleotide sequence of VGAM1447 RNA, herein designated VGAM RNA, also designated SEQ ID:4158.

[50334] Another function of VGAM1447 is therefore inhibition of Unc-5 Homolog D (C. elegans) (UNC5D, Accession NM_080872). Accordingly, utilities of VGAM1447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UNC5D. Zinc Finger Protein 91 Homolog (mouse) (ZFP91, Accession NM_053023) is another VGAM1447 host target gene. ZFP91 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZFP91, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZFP91 BINDING SITE, designated SEQ ID:27579, to the nucleotide sequence of VGAM1447 RNA, herein designated VGAM RNA, also designated SEQ ID:4158.

[50335] Another function of VGAM1447 is therefore inhibition of Zinc Finger Protein 91 Homolog (mouse) (ZFP91, Accession NM_053023). Accordingly, utilities of VGAM1447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFP91. LOC116437

(Accession XM_058185) is another VGAM1447 host target gene. LOC116437 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC116437, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC116437 BINDING SITE, designated SEQ ID:36579, to the nucleotide sequence of VGAM1447 RNA, herein designated VGAM RNA, also designated SEQ ID:4158.

[50336] Another function of VGAM1447 is therefore inhibition of LOC116437 (Accession XM_058185). Accordingly, utilities of VGAM1447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC116437. LOC118987 (Accession XM_058361) is another VGAM1447 host target gene. LOC118987 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC118987, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC118987 BINDING SITE, designated SEQ ID:36608, to the nucleotide sequence of VGAM1447 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4158.

[50337] Another function of VGAM1447 is therefore inhibition of LOC118987 (Accession XM_058361). Accordingly, utilities of VGAM1447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC118987. LOC121219 (Accession XM_058544) is another VGAM1447 host target gene. LOC121219 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC121219, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC121219 BINDING SITE, designated SEQ ID:36652, to the nucleotide sequence of VGAM1447 RNA, herein designated VGAM RNA, also designated SEQ ID:4158.

[50338] Another function of VGAM1447 is therefore inhibition of LOC121219 (Accession XM_058544). Accordingly, utilities of VGAM1447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC121219. LOC121506 (Accession XM_058570) is another VGAM1447 host target gene. LOC121506 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC121506, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC121506 BINDING SITE, designated SEQ ID:36668, to the nucleotide sequence of VGAM1447 RNA, herein designated VGAM RNA, also designated SEQ ID:4158.

[50339] Another function of VGAM1447 is therefore inhibition of LOC121506 (Accession XM_058570). Accordingly, utilities of VGAM1447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC121506. LOC145225 (Accession XM_096741) is another VGAM1447 host target gene. LOC145225 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145225, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145225 BINDING SITE, designated SEQ ID:40524, to the nucleotide sequence of VGAM1447 RNA, herein designated VGAM RNA, also designated SEQ ID:4158.

[50340] Another function of VGAM1447 is therefore inhibition of LOC145225 (Accession XM_096741). Accordingly, utilities of VGAM1447 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC145225. LOC150054 (Accession XM_097797) is another VGAM1447 host target gene. LOC150054 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC150054, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150054 BINDING SITE, designated SEQ ID:41125, to the nucleotide sequence of VGAM1447 RNA, herein designated VGAM RNA, also designated SEQ ID:4158.

[50341] Another function of VGAM1447 is therefore inhibition of LOC150054 (Accession XM_097797). Accordingly, utilities of VGAM1447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150054. LOC151521 (Accession XM_098076) is another VGAM1447 host target gene. LOC151521 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC151521, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151521 BINDING SITE, designated SEQ ID:41368, to

the nucleotide sequence of VGAM1447 RNA, herein designated VGAM RNA, also designated SEQ ID:4158.

[50342] Another function of VGAM1447 is therefore inhibition of LOC151521 (Accession XM_098076). Accordingly, utilities of VGAM1447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151521. LOC219673 (Accession XM_167567) is another VGAM1447 host target gene. LOC219673 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC219673, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219673 BINDING SITE, designated SEQ ID:44694, to the nucleotide sequence of VGAM1447 RNA, herein designated VGAM RNA, also designated SEQ ID:4158.

[50343] Another function of VGAM1447 is therefore inhibition of LOC219673 (Accession XM_167567). Accordingly, utilities of VGAM1447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219673. LOC220766 (Accession XM_165471) is another VGAM1447 host target gene. LOC220766 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC220766, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220766 BINDING SITE, designated SEQ ID:43656, to the nucleotide sequence of VGAM1447 RNA, herein designated VGAM RNA, also designated SEQ ID:4158.

[50344] Another function of VGAM1447 is therefore inhibition of LOC220766 (Accession XM_165471). Accordingly, utilities of VGAM1447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220766. LOC253350 (Accession XM_174261) is another VGAM1447 host target gene. LOC253350 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253350, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253350 BINDING SITE, designated SEQ ID:46586, to the nucleotide sequence of VGAM1447 RNA, herein designated VGAM RNA, also designated SEQ ID:4158.

[50345] Another function of VGAM1447 is therefore inhibition of LOC253350 (Accession XM_174261). Accordingly, utilities

of VGAM1447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253350. LOC257336 (Accession XM_171216) is another VGAM1447 host target gene. LOC257336 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257336, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257336 BINDING SITE, designated SEQ ID:46002, to the nucleotide sequence of VGAM1447 RNA, herein designated VGAM RNA, also designated SEQ ID:4158.

[50346] Another function of VGAM1447 is therefore inhibition of LOC257336 (Accession XM_171216). Accordingly, utilities of VGAM1447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257336. LOC257358 (Accession XM_173138) is another VGAM1447 host target gene. LOC257358 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257358, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC257358 BINDING SITE, designated SEQ ID:46390, to the nucleotide sequence of VGAM1447 RNA, herein designated VGAM RNA, also designated SEQ ID:4158.

[50347] Another function of VGAM1447 is therefore inhibition of LOC257358 (Accession XM_173138). Accordingly, utilities of VGAM1447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257358. LOC51634 (Accession NM_016024) is another VGAM1447 host target gene. LOC51634 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51634, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51634 BINDING SITE, designated SEQ ID:18102, to the nucleotide sequence of VGAM1447 RNA, herein designated VGAM RNA, also designated SEQ ID:4158.

[50348] Another function of VGAM1447 is therefore inhibition of LOC51634 (Accession NM_016024). Accordingly, utilities of VGAM1447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51634. LOC91133 (Accession XM_036372) is another VGAM1447 host target gene. LOC91133 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91133, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91133 BINDING SITE, designated SEQ ID:32430, to the nucleotide sequence of VGAM1447 RNA, herein designated VGAM RNA, also designated SEQ ID:4158.

[50349] Another function of VGAM1447 is therefore inhibition of LOC91133 (Accession XM_036372). Accordingly, utilities of VGAM1447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91133. LOC92344 (Accession XM_044455) is another VGAM1447 host target gene. LOC92344 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92344, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92344 BINDING SITE, designated SEQ ID:34209, to the nucleotide sequence of VGAM1447 RNA, herein designated VGAM RNA, also designated SEQ ID:4158.

[50350] Another function of VGAM1447 is therefore inhibition of

LOC92344 (Accession XM_044455). Accordingly, utilities of VGAM1447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92344. LOC93070 (Accession XM_049046) is another VGAM1447 host target gene. LOC93070 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC93070, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93070 BINDING SITE, designated SEQ ID:35326, to the nucleotide sequence of VGAM1447 RNA, herein designated VGAM RNA, also designated SEQ ID:4158.

[50351] Another function of VGAM1447 is therefore inhibition of LOC93070 (Accession XM_049046). Accordingly, utilities of VGAM1447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93070. LOC93259 (Accession XM_050105) is another VGAM1447 host target gene. LOC93259 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC93259, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC93259 BINDING SITE, designated SEQ ID:35561, to the nucleotide sequence of VGAM1447 RNA, herein designated VGAM RNA, also designated SEQ ID:4158.

[50352] Another function of VGAM1447 is therefore inhibition of LOC93259 (Accession XM_050105). Accordingly, utilities of VGAM1447 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93259. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1448 (VGAM1448) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50353] VGAM1448 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1448 was detected is described hereinabove with reference to Figs. 1–8.

[50354] VGAM1448 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pepper Mottle Virus. VGAM1448 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[50355] VGAM1448 gene encodes a VGAM1448 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1448 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1448 precursor RNA is designated SEQ ID:1434, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1434 is located at position 8114 relative to the genome of Pepper Mottle Virus.

[50356] VGAM1448 precursor RNA folds onto itself, forming VGAM1448 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50357] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1448 folded precursor RNA into VGAM1448 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1448 RNA is designated SEQ ID:4159, and is provided hereinbelow with reference to the sequence listing part.

[50358] VGAM1448 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1448 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1448 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[50359] VGAM1448 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1448 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1448 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1448 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1448 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[50360] The complementary binding of VGAM1448 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1448 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1448 host target RNA into VGAM1448 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50361] It is appreciated that VGAM1448 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1448 host target genes. The mRNA of each one of this plurality of VGAM1448 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1448 RNA, herein designated VGAM RNA, and which when bound by VGAM1448 RNA causes inhibition of translation of respective one or more VGAM1448 host target proteins.

[50362] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1448 gene, herein designated VGAM GENE, on one or more VGAM1448 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[50363] It is yet further appreciated that a function of VGAM1448 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1448 include diagnosis, prevention and treatment of viral infection by Pepper Mottle Virus. Specific functions, and accordingly utilities, of VGAM1448 correlate with, and may be deduced from, the identity of the host target genes which VGAM1448 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50364] Nucleotide sequences of the VGAM1448 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1448 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1448 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1448 are further described hereinbelow with reference to Table 1.

[50365] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM1448 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1448 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50366] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1448 gene, herein designated VGAM is inhibition of expression of VGAM1448 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1448 correlate with, and may be deduced from, the identity of the target genes which VGAM1448 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[50367] M-phase Phosphoprotein 9 (MPHOSPH9, Accession NM_022782) is a VGAM1448 host target gene. MPHOSPH9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MPHOSPH9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MPHOSPH9 BINDING SITE, designated SEQ ID:23065, to the nucleotide sequence of VGAM1448 RNA, herein designated VGAM RNA, also designated SEQ

ID:4159.

[50368] A function of VGAM1448 is therefore inhibition of M-phase Phosphoprotein 9 (MPHOSPH9, Accession NM_022782). Accordingly, utilities of VGAM1448 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MPHOSPH9. DKFZP566J2046 (Accession NM_031208) is another VGAM1448 host target gene. DKFZP566J2046 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP566J2046, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP566J2046 BINDING SITE, designated SEQ ID:25251, to the nucleotide sequence of VGAM1448 RNA, herein designated VGAM RNA, also designated SEQ ID:4159.

[50369] Another function of VGAM1448 is therefore inhibition of DKFZP566J2046 (Accession NM_031208). Accordingly, utilities of VGAM1448 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP566J2046. NY-REN-60 (Accession XM_040506) is another VGAM1448 host target gene. NY-REN-60 BIND-

ING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NY-REN-60, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NY-REN-60 BINDING SITE, designated SEQ ID:33317, to the nucleotide sequence of VGAM1448 RNA, herein designated VGAM RNA, also designated SEQ ID:4159.

[50370] Another function of VGAM1448 is therefore inhibition of NY-REN-60 (Accession XM_040506). Accordingly, utilities of VGAM1448 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NY-REN-60. Zinc Finger, DHHC Domain Containing 5 (ZDHHC5, Accession XM_166204) is another VGAM1448 host target gene. ZDHHC5 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ZDHHC5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZDHHC5 BINDING SITE, designated SEQ ID:44009, to the nucleotide sequence of VGAM1448 RNA, herein designated VGAM RNA, also designated SEQ ID:4159.

[50371] Another function of VGAM1448 is therefore inhibition of Zinc Finger, DHHC Domain Containing 5 (ZDHHC5, Accession XM_166204). Accordingly, utilities of VGAM1448 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZDHHC5. LOC196549 (Accession NM_145293) is another VGAM1448 host target gene. LOC196549 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC196549, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196549 BINDING SITE, designated SEQ ID:29808, to the nucleotide sequence of VGAM1448 RNA, herein designated VGAM RNA, also designated SEQ ID:4159.

[50372] Another function of VGAM1448 is therefore inhibition of LOC196549 (Accession NM_145293). Accordingly, utilities of VGAM1448 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196549. LOC205327 (Accession XM_115788) is another VGAM1448 host target gene. LOC205327 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC205327, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC205327 BINDING SITE, designated SEQ ID:43104, to the nucleotide sequence of VGAM1448 RNA, herein designated VGAM RNA, also designated SEQ ID:4159.

[50373] Another function of VGAM1448 is therefore inhibition of LOC205327 (Accession XM_115788). Accordingly, utilities of VGAM1448 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC205327. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1449 (VGAM1449) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50374] VGAM1449 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1449 was detected is described hereinabove with reference to Figs. 1-8.

[50375] VGAM1449 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2.

VGAM1449 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50376] VGAM1449 gene encodes a VGAM1449 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1449 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1449 precursor RNA is designated SEQ ID:1435, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1435 is located at position 38531 relative to the genome of Equine Herpesvirus 2.

[50377] VGAM1449 precursor RNA folds onto itself, forming VGAM1449 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50378] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM1449 folded precursor RNA into VGAM1449 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 92%) nucleotide sequence of VGAM1449 RNA is designated SEQ ID:4160, and is provided hereinbelow with reference to the sequence listing part.

[50379] VGAM1449 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1449 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1449 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[50380] VGAM1449 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1449 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1449 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1449 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1449 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[50381] The complementary binding of VGAM1449 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1449 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1449 host target RNA into VGAM1449 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50382] It is appreciated that VGAM1449 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1449 host target genes. The mRNA of each one of this plurality of VGAM1449 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1449 RNA, herein designated VGAM RNA, and which when bound by VGAM1449 RNA causes inhibition of translation of respective one or more VGAM1449 host target proteins.

[50383] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1449 gene, herein designated VGAM GENE, on one or more VGAM1449 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[50384] It is yet further appreciated that a function of VGAM1449 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1449 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1449 correlate with, and may be deduced from, the identity of the host target genes which VGAM1449 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50385] Nucleotide sequences of the VGAM1449 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1449 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1449 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1449 are further described hereinbelow with reference to Table 1.

[50386] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1449 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1449 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50387] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1449 gene, herein designated VGAM is inhibition of expression of VGAM1449 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1449 correlate with, and may be deduced from, the identity of the target genes which VGAM1449 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[50388] ALEX2 (Accession NM_014782) is a VGAM1449 host target gene. ALEX2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ALEX2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ALEX2 BINDING SITE, designated SEQ ID:16634, to the nucleotide sequence of VGAM1449 RNA,

herein designated VGAM RNA, also designated SEQ ID:4160.

[50389] A function of VGAM1449 is therefore inhibition of ALEX2 (Accession NM_014782), a gene which play a role in tumor suppression, possibly by being involved in the regulation of normal cell growth. Accordingly, utilities of VGAM1449 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALEX2. The function of ALEX2 has been established by previous studies. Armadillo (arm) repeat proteins (e.g., beta-catenin; 116806), are involved in development, maintenance of tissue integrity, and tumorigenesis. Their common feature is a 42-amino acid motif, the arm repeat. Using a yeast 2-hybrid screen of a brain cDNA library to identify proteins interacting with the peroxisome protease PP110, Kurochkin et al. (2001) identified a cDNA encoding ALEX1. They also cloned a cDNA encoding ALEX1 by screening a testis cDNA library. By searching sequence databases for homologs of ALEX1, they identified cDNAs encoding ALEX2 (OMIM Ref. No. 300363) and ALEX3 (OMIM Ref. No. 300364). Sequence analysis predicted that the 453-amino acid ALEX1 protein contains a potential N-terminal trans-membrane domain, 2 arm repeats, an ATP/GTP-binding

site, and multiple phosphorylation sites. Northern blot and RT-PCR analyses revealed wide expression of a 2.2-kb ALEX1 transcript in normal tissues and cancer cell lines; no expression was detected in carcinomas.

Kurochkin et al. (2001) proposed that the specific loss of expression in epithelial tissue tumors suggests that the ALEX proteins play a role in tumor suppression, possibly by being involved in the regulation of normal cell growth.

[50390] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[50391] Kurochkin, I. V.; Yonemitsu, N.; Funahashi, S.; Nomura, H. : ALEX1, a novel human armadillo repeat protein that is expressed differentially in normal tissues and carcinomas. Biochem. Biophys. Res. Commun. 280: 340–347, 2001. ; and

[50392] CREATION DATE.

[50393] Further studies establishing the function and utilities of ALEX2 are found in John Hopkins OMIM database record ID 300363, and in cited publications numbered 6734–6735 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Forkhead Box E1 (thyroid transcription factor 2) (FOXE1, Accession

NM_004473) is another VGAM1449 host target gene.

FOX E1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FOX E1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FOX E1 BINDING SITE, designated SEQ ID:10780, to the nucleotide sequence of VGAM1449 RNA, herein designated VGAM RNA, also designated SEQ ID:4160.

[50394] Another function of VGAM1449 is therefore inhibition of Forkhead Box E1 (thyroid transcription factor 2) (FOX E1, Accession NM_004473). Accordingly, utilities of VGAM1449 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FOX E1. Low Density Lipoprotein Receptor-related Protein 4 (LRP4, Accession XM_035037) is another VGAM1449 host target gene. LRP4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LRP4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LRP4 BINDING SITE, designated SEQ ID:32201,

to the nucleotide sequence of VGAM1449 RNA, herein designated VGAM RNA, also designated SEQ ID:4160.

[50395] Another function of VGAM1449 is therefore inhibition of Low Density Lipoprotein Receptor-related Protein 4 (LRP4, Accession XM_035037). Accordingly, utilities of VGAM1449 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LRP4. Sorting Nexin 5 (SNX5, Accession NM_014426) is another VGAM1449 host target gene. SNX5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SNX5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNX5 BINDING SITE, designated SEQ ID:15785, to the nucleotide sequence of VGAM1449 RNA, herein designated VGAM RNA, also designated SEQ ID:4160.

[50396] Another function of VGAM1449 is therefore inhibition of Sorting Nexin 5 (SNX5, Accession NM_014426). Accordingly, utilities of VGAM1449 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNX5. Transcription Factor Dp-1 (TFDP1, Accession NM_007111) is another VGAM1449 host target gene.

TFDP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TFDP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TFDP1 BINDING SITE, designated SEQ ID:13976, to the nucleotide sequence of VGAM1449 RNA, herein designated VGAM RNA, also designated SEQ ID:4160.

[50397] Another function of VGAM1449 is therefore inhibition of Transcription Factor Dp-1 (TFDP1, Accession NM_007111). Accordingly, utilities of VGAM1449 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TFDP1. Chromosome 5 Open Reading Frame 5 (C5orf5, Accession NM_016603) is another VGAM1449 host target gene. C5orf5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C5orf5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C5orf5 BINDING SITE, designated SEQ ID:18698, to the nucleotide sequence of VGAM1449 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4160.

[50398] Another function of VGAM1449 is therefore inhibition of Chromosome 5 Open Reading Frame 5 (C5orf5, Accession NM_016603). Accordingly, utilities of VGAM1449 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C5orf5. FLJ20552 (Accession NM_017876) is another VGAM1449 host target gene. FLJ20552 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20552, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20552 BINDING SITE, designated SEQ ID:19548, to the nucleotide sequence of VGAM1449 RNA, herein designated VGAM RNA, also designated SEQ ID:4160.

[50399] Another function of VGAM1449 is therefore inhibition of FLJ20552 (Accession NM_017876). Accordingly, utilities of VGAM1449 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20552. P114-RHO-GEF (Accession NM_015318) is another VGAM1449 host target gene. P114-RHO-GEF BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by P114-RHO-GEF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P114-RHO-GEF BINDING SITE, designated SEQ ID:17640, to the nucleotide sequence of VGAM1449 RNA, herein designated VGAM RNA, also designated SEQ ID:4160.

[50400] Another function of VGAM1449 is therefore inhibition of P114-RHO-GEF (Accession NM_015318). Accordingly, utilities of VGAM1449 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P114-RHO-GEF. LOC118851 (Accession XM_061180) is another VGAM1449 host target gene. LOC118851 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC118851, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC118851 BINDING SITE, designated SEQ ID:37201, to the nucleotide sequence of VGAM1449 RNA, herein designated VGAM RNA, also designated SEQ ID:4160.

[50401] Another function of VGAM1449 is therefore inhibition of LOC118851 (Accession XM_061180). Accordingly, utilities of VGAM1449 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC118851. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1450 (VGAM1450) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50402] VGAM1450 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1450 was detected is described hereinabove with reference to Figs. 1–8.

[50403] VGAM1450 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM1450 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50404] VGAM1450 gene encodes a VGAM1450 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM1450 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1450 precursor RNA is designated SEQ ID:1436, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1436 is located at position 40972 relative to the genome of Equine Herpesvirus 2.

- [50405] VGAM1450 precursor RNA folds onto itself, forming VGAM1450 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [50406] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1450 folded precursor RNA into VGAM1450 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1450 RNA is designated SEQ ID:4161, and is provided hereinbelow with reference to the sequence listing part.

[50407] VGAM1450 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1450 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1450 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[50408] VGAM1450 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1450 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1450 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1450 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1450 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[50409] The complementary binding of VGAM1450 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1450 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1450 host target RNA into VGAM1450 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50410] It is appreciated that VGAM1450 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1450 host target genes. The mRNA of each one of this plurality of VGAM1450 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1450 RNA, herein designated VGAM RNA, and which when bound by VGAM1450 RNA causes inhibition of translation of respective one or more VGAM1450 host target proteins.

[50411] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1450 gene, herein designated VGAM GENE, on one or more VGAM1450 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[50412] It is yet further appreciated that a function of VGAM1450 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1450 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1450 correlate with, and may be deduced from, the identity of the host target genes which VGAM1450 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50413] Nucleotide sequences of the VGAM1450 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1450 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1450 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1450 are further described hereinbelow with reference to Table 1.

[50414] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1450 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1450 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[50415] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1450 gene, herein designated VGAM is inhibition of expression of VGAM1450 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1450 correlate with, and may be deduced from, the identity of the target genes which VGAM1450 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[50416] KIAA1128 (Accession XM_043596) is a VGAM1450 host target gene. KIAA1128 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1128, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1128 BINDING SITE, designated SEQ ID:33969, to the nucleotide sequence of VGAM1450 RNA, herein designated VGAM RNA, also designated SEQ ID:4161.

[50417] A function of VGAM1450 is therefore inhibition of KIAA1128 (Accession XM_043596). Accordingly, utilities of VGAM1450 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1128. LOC150225 (Accession XM_097870) is another VGAM1450 host target gene. LOC150225 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150225, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150225 BINDING SITE, designated SEQ ID:41184, to the nucleotide sequence of VGAM1450 RNA, herein designated VGAM RNA, also designated SEQ ID:4161.

[50418] Another function of VGAM1450 is therefore inhibition of LOC150225 (Accession XM_097870). Accordingly, utilities of VGAM1450 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150225. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1451 (VGAM1451) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50419] VGAM1451 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1451 was detected is described hereinabove with reference to Figs. 1–8.

[50420] VGAM1451 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM1451 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50421] VGAM1451 gene encodes a VGAM1451 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1451 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1451 precursor RNA is designated SEQ ID:1437, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1437 is located at position 40488 relative to the genome of Equine Herpesvirus 2.

[50422] VGAM1451 precursor RNA folds onto itself, forming VGAM1451 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide

sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50423] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1451 folded precursor RNA into VGAM1451 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 56%) nucleotide sequence of VGAM1451 RNA is designated SEQ ID:4162, and is provided hereinbelow with reference to the sequence listing part.

[50424] VGAM1451 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1451 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1451 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[50425] VGAM1451 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1451 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1451 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1451 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1451 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[50426] The complementary binding of VGAM1451 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1451 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1451 host target RNA into VGAM1451 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50427] It is appreciated that VGAM1451 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1451 host target genes. The mRNA of each one of this plurality of VGAM1451 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1451 RNA, herein designated VGAM RNA, and which when bound by VGAM1451 RNA causes inhibition of translation of respective one or more VGAM1451 host target proteins.

[50428] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1451 gene, herein designated VGAM GENE, on one or more VGAM1451 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[50429] It is yet further appreciated that a function of VGAM1451 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1451 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1451 correlate with, and may be deduced from, the identity of the host target genes which VGAM1451 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50430] Nucleotide sequences of the VGAM1451 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1451 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM1451 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1451 are further described hereinbelow with reference to Table 1.

[50431] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1451 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1451 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50432] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1451 gene, herein designated VGAM is inhibition of expression of VGAM1451 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1451 correlate with, and may be deduced from, the identity of the target genes which VGAM1451 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[50433] Cyclin T2 (CCNT2, Accession NM_058241) is a VGAM1451 host target gene. CCNT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CCNT2, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCNT2 BINDING SITE, designated SEQ ID:27769, to the nucleotide sequence of VGAM1451 RNA, herein designated VGAM RNA, also designated SEQ ID:4162.

[50434] A function of VGAM1451 is therefore inhibition of Cyclin T2 (CCNT2, Accession NM_058241), a gene which is a regulatory subunit of the cyclin-dependent kinase pair (cdk9/cyclin t) complex. Accordingly, utilities of VGAM1451 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCNT2. The function of CCNT2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM159. KIAA1161 (Accession XM_088501) is another VGAM1451 host target gene. KIAA1161 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1161, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1161 BINDING SITE, designated SEQ ID:39744, to the

nucleotide sequence of VGAM1451 RNA, herein designated VGAM RNA, also designated SEQ ID:4162.

[50435] Another function of VGAM1451 is therefore inhibition of KIAA1161 (Accession XM_088501). Accordingly, utilities of VGAM1451 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1161. KIAA1274 (Accession XM_166125) is another VGAM1451 host target gene. KIAA1274 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1274, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1274 BINDING SITE, designated SEQ ID:43907, to the nucleotide sequence of VGAM1451 RNA, herein designated VGAM RNA, also designated SEQ ID:4162.

[50436] Another function of VGAM1451 is therefore inhibition of KIAA1274 (Accession XM_166125). Accordingly, utilities of VGAM1451 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1274. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 1452 (VGAM1452) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50437] VGAM1452 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1452 was detected is described hereinabove with reference to Figs. 1–8.

[50438] VGAM1452 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM1452 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50439] VGAM1452 gene encodes a VGAM1452 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1452 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1452 precursor RNA is designated SEQ ID:1438, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1438 is located at position 42439 relative to the genome of Equine Herpesvirus 2.

[50440] VGAM1452 precursor RNA folds onto itself, forming VGAM1452 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50441] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1452 folded precursor RNA into VGAM1452 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide sequence of VGAM1452 RNA is designated SEQ ID:4163, and is provided hereinbelow with reference to the sequence listing part.

[50442] VGAM1452 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1452 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1452 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[50443] VGAM1452 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1452 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1452 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1452 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1452 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[50444] The complementary binding of VGAM1452 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1452 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1452 host target RNA into VGAM1452 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50445] It is appreciated that VGAM1452 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1452 host target genes. The mRNA of each one of this plurality of VGAM1452 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1452 RNA, herein designated VGAM RNA, and which when bound by VGAM1452 RNA causes inhibition of translation of respective one or more VGAM1452 host target proteins.

[50446] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1452 gene, herein designated VGAM GENE, on one or more VGAM1452 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[50447] It is yet further appreciated that a function of VGAM1452 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1452 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1452 correlate with, and may be deduced from, the identity of

the host target genes which VGAM1452 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50448] Nucleotide sequences of the VGAM1452 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1452 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1452 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1452 are further described hereinbelow with reference to Table 1.

[50449] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1452 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1452 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50450] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1452 gene, herein designated VGAM is inhibition of expression of VGAM1452 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1452 correlate with, and may be deduced from, the identity of the target genes which VGAM1452

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[50451] Cytoplasmic FMR1 Interacting Protein 2 (CYFIP2, Accession XM_056963) is a VGAM1452 host target gene. CYFIP2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CYFIP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYFIP2 BINDING SITE, designated SEQ ID:36440, to the nucleotide sequence of VGAM1452 RNA, herein designated VGAM RNA, also designated SEQ ID:4163.

[50452] A function of VGAM1452 is therefore inhibition of Cytoplasmic FMR1 Interacting Protein 2 (CYFIP2, Accession XM_056963). Accordingly, utilities of VGAM1452 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYFIP2. ELL (Accession NM_006532) is another VGAM1452 host target gene. ELL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ELL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

ELL BINDING SITE, designated SEQ ID:13279, to the nucleotide sequence of VGAM1452 RNA, herein designated VGAM RNA, also designated SEQ ID:4163.

[50453] Another function of VGAM1452 is therefore inhibition of ELL (Accession NM_006532). Accordingly, utilities of VGAM1452 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ELL. GNAS Complex Locus (GNAS, Accession NM_016592) is another VGAM1452 host target gene. GNAS BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GNAS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GNAS BINDING SITE, designated SEQ ID:18680, to the nucleotide sequence of VGAM1452 RNA, herein designated VGAM RNA, also designated SEQ ID:4163.

[50454] Another function of VGAM1452 is therefore inhibition of GNAS Complex Locus (GNAS, Accession NM_016592), a gene which transduces signals from G protein-coupled receptors and activates adenylyl cyclase. Accordingly, utilities of VGAM1452 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with GNAS. The function of GNAS and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1205. Growth Factor Receptor-bound Protein 10 (GRB10, Accession NM_005311) is another VGAM1452 host target gene. GRB10 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GRB10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRB10 BINDING SITE, designated SEQ ID:11784, to the nucleotide sequence of VGAM1452 RNA, herein designated VGAM RNA, also designated SEQ ID:4163.

[50455] Another function of VGAM1452 is therefore inhibition of Growth Factor Receptor-bound Protein 10 (GRB10, Accession NM_005311), a gene which plays a functional role in insulin and IGF-I signaling. Accordingly, utilities of VGAM1452 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRB10. The function of GRB10 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to VGAM441.SET Binding Factor 1 (SBF1, Accession XM_037447) is another VGAM1452 host target gene. SBF1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SBF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SBF1 BINDING SITE, designated SEQ ID:32625, to the nucleotide sequence of VGAM1452 RNA, herein designated VGAM RNA, also designated SEQ ID:4163.

[50456] Another function of VGAM1452 is therefore inhibition of SET Binding Factor 1 (SBF1, Accession XM_037447), a gene which is of unknown function, could be a tyrosine-phosphatase. Accordingly, utilities of VGAM1452 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SBF1. The function of SBF1 has been established by previous studies. Mutations in the myotubularin (MTM1; 310400) dual-specific phosphatase (DSP) gene cause X-linked myotubular myopathy. By searching an EST database for sequences related to MTM1, Laporte et al. (1998) identified a partial MTMR5 (myotubularin-related protein-5) cDNA and cDNAs encoding 3 other novel members of the myotubularin (MTM)

protein family. They noted that the predicted protein lacks catalytically essential residues in the tyrosine phosphatase/DSP active site. Northern blot analysis revealed that the 6-kb MTMR5 mRNA was expressed in all tissues tested but testis. The SET (Suvar3-9, Enhancer of zeste, trithorax) domain was originally identified as a characteristic motif in several *Drosophila* proteins that contribute to epigenetic mechanisms of gene regulation. The human protooncoprotein HRX (OMIM Ref. No. 159555) also contains a SET domain. Using a yeast 2-hybrid assay with the SET domain of HRX as bait, Cui et al. (1998) isolated cDNAs encoding MTMR5, or SBF1 (SET-binding factor 1). Both SBF1 and MTM1 interacted with HRX in vitro and in vivo. This interaction was abrogated in an oncogenic form of HRX lacking the SET domain. Like HRX, both SBF1 and MTM1 localized to the nucleus of mammalian cells. The authors found that the SET interaction domain (SID) of the SBF1 protein displays a paired amphipathic helix secondary structure. The SID is highly conserved in the myotubularin-related family of proteins. In contrast with MTM1, SBF1 lacked dual-specificity phosphatase activity in vitro, suggesting that SBF1 acts as a protective factor that prevents substrate dephosphorylation. Ectopic ex-

pression of SBF1 induced NIH 3T3 cell transformation, leading Cui et al. (1998) to propose that displacement or exclusion of endogenous, catalytically active phosphatases from SET-domain proteins is a critical molecular event underlying loss of growth control. Similarly, ectopic expression of SBF1 impaired the in vitro differentiation of myoblast cells, implying that interactions of SET-domain proteins with catalytically active members of the MTM family are essential for execution of the myogenic program. The authors concluded that MTM-type phosphatases link SET domain-containing components of the epigenetic regulatory machinery with signaling pathways involved in growth and differentiation.

[50457] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[50458] Cui, X.; De Vivo, I.; Slany, R.; Miyamoto, A.; Firestein, R.; Cleary, M. L. : Association of SET domain and myotubularin-related proteins modulates growth control. *Nature Genet.* 18: 331–337, 1998. ; and

[50459] Laporte, J.; Blondeau, F.; Buj-Bello, A.; Tentler, D.; Kretz, C.; Dahl, N.; Mandel, J.-L. : Characterization of the myotubularin dual specificity phosphatase gene family from

yeast to h.

[50460] Further studies establishing the function and utilities of SBF1 are found in John Hopkins OMIM database record ID 603560, and in cited publications numbered 500 and 7254 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Tripartite Motif-containing 14 (TRIM14, Accession NM_014788) is another VGAM1452 host target gene. TRIM14 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRIM14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIM14 BINDING SITE, designated SEQ ID:16665, to the nucleotide sequence of VGAM1452 RNA, herein designated VGAM RNA, also designated SEQ ID:4163.

[50461] Another function of VGAM1452 is therefore inhibition of Tripartite Motif-containing 14 (TRIM14, Accession NM_014788), a gene which is composed of 3 zinc-binding domains and is involved in development and cell growth. Accordingly, utilities of VGAM1452 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM14. The function of TRIM14 and

its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM180.Chromosome 11 Open Reading Frame 9

(C11orf9, Accession NM_013279) is another VGAM1452 host target gene. C11orf9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C11orf9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C11orf9 BINDING SITE, designated SEQ ID:14947, to the nucleotide sequence of VGAM1452 RNA, herein designated VGAM RNA, also designated SEQ ID:4163.

[50462] Another function of VGAM1452 is therefore inhibition of Chromosome 11 Open Reading Frame 9 (C11orf9, Accession NM_013279). Accordingly, utilities of VGAM1452 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C11orf9. Chromosome 5 Open Reading Frame 7 (C5orf7, Accession XM_033576) is another VGAM1452 host target gene. C5orf7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C5orf7, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C5orf7 BINDING SITE, designated SEQ ID:31940, to the nucleotide sequence of VGAM1452 RNA, herein designated VGAM RNA, also designated SEQ ID:4163.

[50463] Another function of VGAM1452 is therefore inhibition of Chromosome 5 Open Reading Frame 7 (C5orf7, Accession XM_033576). Accordingly, utilities of VGAM1452 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C5orf7. CXYorf1 (Accession XM_088704) is another VGAM1452 host target gene. CXYorf1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CXYorf1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CXYorf1 BINDING SITE, designated SEQ ID:39911, to the nucleotide sequence of VGAM1452 RNA, herein designated VGAM RNA, also designated SEQ ID:4163.

[50464] Another function of VGAM1452 is therefore inhibition of CXYorf1 (Accession XM_088704). Accordingly, utilities of

VGAM1452 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CXY-orf1. FLJ10743 (Accession NM_018201) is another VGAM1452 host target gene. FLJ10743 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10743, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10743 BINDING SITE, designated SEQ ID:20080, to the nucleotide sequence of VGAM1452 RNA, herein designated VGAM RNA, also designated SEQ ID:4163.

[50465] Another function of VGAM1452 is therefore inhibition of FLJ10743 (Accession NM_018201). Accordingly, utilities of VGAM1452 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10743. FLJ22593 (Accession NM_024703) is another VGAM1452 host target gene. FLJ22593 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ22593, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22593

BINDING SITE, designated SEQ ID:24017, to the nucleotide sequence of VGAM1452 RNA, herein designated VGAM RNA, also designated SEQ ID:4163.

[50466] Another function of VGAM1452 is therefore inhibition of FLJ22593 (Accession NM_024703). Accordingly, utilities of VGAM1452 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22593. FLJ22944 (Accession NM_025145) is another VGAM1452 host target gene. FLJ22944 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22944, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22944 BINDING SITE, designated SEQ ID:24782, to the nucleotide sequence of VGAM1452 RNA, herein designated VGAM RNA, also designated SEQ ID:4163.

[50467] Another function of VGAM1452 is therefore inhibition of FLJ22944 (Accession NM_025145). Accordingly, utilities of VGAM1452 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22944. KIAA0620 (Accession XM_030707) is another VGAM1452 host target gene. KIAA0620 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0620, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0620 BINDING SITE, designated SEQ ID:31119, to the nucleotide sequence of VGAM1452 RNA, herein designated VGAM RNA, also designated SEQ ID:4163.

[50468] Another function of VGAM1452 is therefore inhibition of KIAA0620 (Accession XM_030707). Accordingly, utilities of VGAM1452 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0620. KIAA0864 (Accession XM_032630) is another VGAM1452 host target gene. KIAA0864 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0864, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0864 BINDING SITE, designated SEQ ID:31683, to the nucleotide sequence of VGAM1452 RNA, herein designated VGAM RNA, also designated SEQ ID:4163.

[50469] Another function of VGAM1452 is therefore inhibition of

KIAA0864 (Accession XM_032630). Accordingly, utilities of VGAM1452 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0864. KIAA1432 (Accession XM_039698) is another VGAM1452 host target gene. KIAA1432 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1432, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1432 BINDING SITE, designated SEQ ID:33151, to the nucleotide sequence of VGAM1452 RNA, herein designated VGAM RNA, also designated SEQ ID:4163.

[50470] Another function of VGAM1452 is therefore inhibition of KIAA1432 (Accession XM_039698). Accordingly, utilities of VGAM1452 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1432. KIAA1719 (Accession XM_042936) is another VGAM1452 host target gene. KIAA1719 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1719, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1719 BINDING SITE, designated SEQ ID:33822, to the nucleotide sequence of VGAM1452 RNA, herein designated VGAM RNA, also designated SEQ ID:4163.

[50471] Another function of VGAM1452 is therefore inhibition of KIAA1719 (Accession XM_042936). Accordingly, utilities of VGAM1452 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1719. LOC129607 (Accession XM_059368) is another VGAM1452 host target gene. LOC129607 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC129607, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC129607 BINDING SITE, designated SEQ ID:36974, to the nucleotide sequence of VGAM1452 RNA, herein designated VGAM RNA, also designated SEQ ID:4163.

[50472] Another function of VGAM1452 is therefore inhibition of LOC129607 (Accession XM_059368). Accordingly, utilities of VGAM1452 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC129607. LOC154089 (Accession XM_087846) is an-

other VGAM1452 host target gene. LOC154089 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC154089, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154089 BINDING SITE, designated SEQ ID:39463, to the nucleotide sequence of VGAM1452 RNA, herein designated VGAM RNA, also designated SEQ ID:4163.

[50473] Another function of VGAM1452 is therefore inhibition of LOC154089 (Accession XM_087846). Accordingly, utilities of VGAM1452 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154089. LOC200093 (Accession XM_032184) is another VGAM1452 host target gene. LOC200093 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC200093, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200093 BINDING SITE, designated SEQ ID:31603, to the nucleotide sequence of VGAM1452 RNA, herein designated VGAM RNA, also designated SEQ ID:4163.

[50474] Another function of VGAM1452 is therefore inhibition of LOC200093 (Accession XM_032184). Accordingly, utilities of VGAM1452 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200093. LOC221876 (Accession XM_168220) is another VGAM1452 host target gene. LOC221876 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC221876, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221876 BINDING SITE, designated SEQ ID:45076, to the nucleotide sequence of VGAM1452 RNA, herein designated VGAM RNA, also designated SEQ ID:4163.

[50475] Another function of VGAM1452 is therefore inhibition of LOC221876 (Accession XM_168220). Accordingly, utilities of VGAM1452 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221876. LOC91040 (Accession XM_035641) is another VGAM1452 host target gene. LOC91040 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC91040, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91040 BINDING SITE, designated SEQ ID:32320, to the nucleotide sequence of VGAM1452 RNA, herein designated VGAM RNA, also designated SEQ ID:4163.

[50476] Another function of VGAM1452 is therefore inhibition of LOC91040 (Accession XM_035641). Accordingly, utilities of VGAM1452 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91040. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1453 (VGAM1453) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50477] VGAM1453 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1453 was detected is described hereinabove with reference to Figs. 1–8.

[50478] VGAM1453 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM1453 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[50479] VGAM1453 gene encodes a VGAM1453 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1453 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1453 precursor RNA is designated SEQ ID:1439, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1439 is located at position 41504 relative to the genome of Equine Herpesvirus 2.

[50480] VGAM1453 precursor RNA folds onto itself, forming VGAM1453 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50481] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1453 folded precursor RNA into VGAM1453

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1453 RNA is designated SEQ ID:4164, and is provided hereinbelow with reference to the sequence listing part.

[50482] VGAM1453 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1453 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1453 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[50483] VGAM1453 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1453 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1453 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1453 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1453 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[50484] The complementary binding of VGAM1453 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1453 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1453 host target RNA into VGAM1453 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[50485] It is appreciated that VGAM1453 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1453 host target genes. The mRNA of each one of this plurality of VGAM1453 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1453 RNA, herein designated VGAM RNA, and which when bound by VGAM1453 RNA causes inhibition of translation of respective one or more VGAM1453 host target proteins.

[50486] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1453 gene, herein designated VGAM GENE, on one or more VGAM1453 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[50487] It is yet further appreciated that a function of VGAM1453 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1453 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1453 correlate with, and may be deduced from, the identity of the host target genes which VGAM1453 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50488] Nucleotide sequences of the VGAM1453 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1453 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1453 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1453 are further described hereinbelow with reference to Table 1.

[50489] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1453 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1453 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50490] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1453 gene, herein designated VGAM is inhibition of expression of VGAM1453 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1453 correlate with, and may be deduced from, the identity of the target genes which VGAM1453 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[50491] CERD4 (Accession NM_012074) is a VGAM1453 host target gene. CERD4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CERD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CERD4 BINDING SITE, designated SEQ ID:14341, to the nucleotide sequence of VGAM1453 RNA, herein designated VGAM RNA, also designated SEQ

ID:4164.

[50492] A function of VGAM1453 is therefore inhibition of CERD4 (Accession NM_012074). Accordingly, utilities of VGAM1453 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CERD4. Chorea Acanthocytosis (CHAC, Accession NM_033305) is another VGAM1453 host target gene. CHAC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CHAC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHAC BINDING SITE, designated SEQ ID:27139, to the nucleotide sequence of VGAM1453 RNA, herein designated VGAM RNA, also designated SEQ ID:4164.

[50493] Another function of VGAM1453 is therefore inhibition of Chorea Acanthocytosis (CHAC, Accession NM_033305), a gene which may regulate the cycling of proteins. Accordingly, utilities of VGAM1453 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHAC. The function of CHAC and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove

with reference to VGAM650. Corticotropin Releasing Hormone (CRH, Accession NM_000756) is another VGAM1453 host target gene. CRH BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CRH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRH BINDING SITE, designated SEQ ID:6409, to the nucleotide sequence of VGAM1453 RNA, herein designated VGAM RNA, also designated SEQ ID:4164.

[50494] Another function of VGAM1453 is therefore inhibition of Corticotropin Releasing Hormone (CRH, Accession NM_000756), a gene which regulates the release of corticotropin from pituitary gland. Accordingly, utilities of VGAM1453 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRH. The function of CRH has been established by previous studies. Response to stress in mammals requires an intact hypothalamic-pituitary-adrenal axis. The proximal part of the response is mediated by secretion of corticotropin-releasing hormone (CRH) by the paraventricular nucleus of the hypothalamus. CRH is a 41-amino acid peptide derived by

enzymatic cleavage from a 191-amino acid preprohormone. Shibahara et al. (1983) cloned and sequenced the human CRH gene. Arbiser et al. (1988) assigned the gene for CRH to 8q13 by somatic cell hybrid and in situ hybridization studies. The absence of secondary hybridization strongly suggested that hypothalamic and placental CRH are transcribed from the same gene. Kellogg et al. (1989) corroborated the assignment to 8q13 by in situ hybridization. Knapp et al. (1993) showed that the homologous gene is located on mouse chromosome 3. Sebaceous glands may be involved in a pathway conceptually similar to that of the hypothalamic-pituitary-adrenal (HPA) axis. CRH is the most proximal element of the HPA axis, and it acts as a central coordinator for neuroendocrine and behavioral responses to stress. To examine the probability of an HPA equivalent pathway in sebaceous glands, Zouboulis et al. (2002) investigated the expression of CRH, CRH-binding protein, CRHBP (OMIM Ref. No. 122559), and CRH receptors (CRHR1, 122561 and CRHR2, 602034) in sebocytes in vitro and their regulation by CRH and several other hormones. CRHR1 was the predominant type, being twice as abundant as CRHR2. CRH was biologically active on human sebocytes; it induced biphasic in-

crease in synthesis of sebaceous lipids, although it did not affect cell viability, cell proliferation, or IL1B (OMIM Ref. No. 147720)–induced IL8 (OMIM Ref. No. 146930) release. Zouboulis et al. (2002) interpreted these and other findings as indicating that CRH may be an autocrine hormone for human sebocytes that exerts homeostatic lipogenic activity, whereas testosterone and growth hormone induced CRH negative feedback. The findings implicated CRH in the clinical development of acne, seborrhea, androgenetic alopecia, skin aging, xerosis, and other skin disorders associated with alterations in lipid formation of sebaceous origin. Animal model experiments lend further support to the function of CRH. In adult male rhesus macaques, Habib et al. (2000) evaluated the effects of a lipophilic nonpeptide antagonist to CRH type 1 receptor, antalarmin, on the behavioral, neuroendocrine, and autonomic components of the stress response. After oral administration, significant antalarmin concentrations were detected in the systemic circulation and the cerebrospinal fluid. The monkeys were exposed to an intense social stressor, namely, placement of 2 unfamiliar males in adjacent cages separated only by a transparent Plexiglas screen. Antalarmin significantly inhibited a repertoire of

behaviors associated with anxiety and fear, such as body tremors, grimacing, teeth gnashing, urination, and defecation. In contrast, antalarmin increased exploratory and sexual behaviors that are normally suppressed during stress. Moreover, antalarmin significantly diminished the increases in cerebrospinal fluid CRH as well as the pituitary–adrenal, sympathetic, and adrenal medullary responses to stress. Habib et al. (2000) suggested that a CRH type 1 receptor antagonist may be of therapeutic value in human psychiatric, reproductive, and cardiovascular disorders associated with CRH system hyperactivity.

[50495] It is appreciated that the abovementioned animal model for CRH is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[50496] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[50497] Knapp, L. T.; Keegan, C. E.; Seasholtz, A. F.; Camper, S. A. : Corticotropin–releasing hormone (Crh) maps to mouse chromosome 3. *Mammalian Genome* 4: 615–617, 1993. ; and

[50498] Habib, K. E.; Weld, K. P.; Rice, K. C.; Pushkas, J.; Cham–

poux, M.; Listwak, S.; Webster, E. L.; Atkinson, A. J.; Schulkin, J.; Contoreggi, C.; Chrousos, G. P.; McCann, S. M.; Suomi, S. J.

[50499] Further studies establishing the function and utilities of CRH are found in John Hopkins OMIM database record ID 122560, and in cited publications numbered 196 and 2034–1983 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Development and Differentiation Enhancing Factor 1 (DDEF1, Accession XM_005169) is another VGAM1453 host target gene. DDEF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DDEF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDEF1 BINDING SITE, designated SEQ ID:29963, to the nucleotide sequence of VGAM1453 RNA, herein designated VGAM RNA, also designated SEQ ID:4164.

[50500] Another function of VGAM1453 is therefore inhibition of Development and Differentiation Enhancing Factor 1 (DDEF1, Accession XM_005169). Accordingly, utilities of VGAM1453 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with DDEF1. Deoxyribonuclease II, Lysosomal (DNASE2, Accession NM_001375) is another VGAM1453 host target gene. DNASE2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DNASE2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DNASE2 BINDING SITE, designated SEQ ID:7048, to the nucleotide sequence of VGAM1453 RNA, herein designated VGAM RNA, also designated SEQ ID:4164.

[50501] Another function of VGAM1453 is therefore inhibition of Deoxyribonuclease II, Lysosomal (DNASE2, Accession NM_001375), a gene which has a possible role in apoptosis. Accordingly, utilities of VGAM1453 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNASE2. The function of DNASE2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM885. Solute Carrier Family 9 (sodium/hydrogen exchanger), Isoform 5 (SLC9A5, Accession XM_007868) is another VGAM1453

host target gene. SLC9A5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC9A5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC9A5 BINDING SITE, designated SEQ ID:30062, to the nucleotide sequence of VGAM1453 RNA, herein designated VGAM RNA, also designated SEQ ID:4164.

[50502] Another function of VGAM1453 is therefore inhibition of Solute Carrier Family 9 (sodium/hydrogen exchanger), Isoform 5 (SLC9A5, Accession XM_007868). Accordingly, utilities of VGAM1453 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC9A5. Von Hippel-Lindau Syndrome (VHL, Accession NM_000551) is another VGAM1453 host target gene. VHL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by VHL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VHL BINDING SITE, designated SEQ ID:6159, to the nucleotide sequence of VGAM1453 RNA, herein designated

VGAM RNA, also designated SEQ ID:4164.

[50503] Another function of VGAM1453 is therefore inhibition of Von Hippel–Lindau Syndrome (VHL, Accession NM_000551), a gene which may control rna stability through the selective degradation of rna–bound proteins. Accordingly, utilities of VGAM1453 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VHL. The function of VHL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM197. ADP–ribosylation Factor GTPase Activating Protein 1 (ARFGAP1, Accession NM_018209) is another VGAM1453 host target gene. ARFGAP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ARFGAP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARFGAP1 BINDING SITE, designated SEQ ID:20107, to the nucleotide sequence of VGAM1453 RNA, herein designated VGAM RNA, also designated SEQ ID:4164.

[50504] Another function of VGAM1453 is therefore inhibition of

ADP-ribosylation Factor GTPase Activating Protein 1 (ARFGAP1, Accession NM_018209). Accordingly, utilities of VGAM1453 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARFGAP1. Cyclin M2 (CNNM2, Accession NM_017649) is another VGAM1453 host target gene. CNNM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CNNM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNNM2 BINDING SITE, designated SEQ ID:19153, to the nucleotide sequence of VGAM1453 RNA, herein designated VGAM RNA, also designated SEQ ID:4164.

[50505] Another function of VGAM1453 is therefore inhibition of Cyclin M2 (CNNM2, Accession NM_017649). Accordingly, utilities of VGAM1453 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNNM2. DKFZp547D155 (Accession XM_046977) is another VGAM1453 host target gene. DKFZp547D155 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp547D155, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp547D155 BINDING SITE, designated SEQ ID:34868, to the nucleotide sequence of VGAM1453 RNA, herein designated VGAM RNA, also designated SEQ ID:4164.

[50506] Another function of VGAM1453 is therefore inhibition of DKFZp547D155 (Accession XM_046977). Accordingly, utilities of VGAM1453 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547D155. DKFZP564B1023 (Accession NM_031306) is another VGAM1453 host target gene. DKFZP564B1023 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564B1023, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564B1023 BINDING SITE, designated SEQ ID:25341, to the nucleotide sequence of VGAM1453 RNA, herein designated VGAM RNA, also designated SEQ ID:4164.

[50507] Another function of VGAM1453 is therefore inhibition of DKFZP564B1023 (Accession NM_031306). Accordingly,

utilities of VGAM1453 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564B1023. FLJ12428 (Accession NM_022783) is another VGAM1453 host target gene. FLJ12428 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12428, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12428 BINDING SITE, designated SEQ ID:23066, to the nucleotide sequence of VGAM1453 RNA, herein designated VGAM RNA, also designated SEQ ID:4164.

[50508] Another function of VGAM1453 is therefore inhibition of FLJ12428 (Accession NM_022783). Accordingly, utilities of VGAM1453 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12428. FLJ20694 (Accession NM_017928) is another VGAM1453 host target gene. FLJ20694 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20694, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20694

BINDING SITE, designated SEQ ID:19607, to the nucleotide sequence of VGAM1453 RNA, herein designated VGAM RNA, also designated SEQ ID:4164.

[50509] Another function of VGAM1453 is therefore inhibition of FLJ20694 (Accession NM_017928). Accordingly, utilities of VGAM1453 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20694. FLJ22693 (Accession NM_022750) is another VGAM1453 host target gene. FLJ22693 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ22693, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22693 BINDING SITE, designated SEQ ID:22974, to the nucleotide sequence of VGAM1453 RNA, herein designated VGAM RNA, also designated SEQ ID:4164.

[50510] Another function of VGAM1453 is therefore inhibition of FLJ22693 (Accession NM_022750). Accordingly, utilities of VGAM1453 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22693. KIAA0972 (Accession NM_014930) is another VGAM1453 host target gene. KIAA0972 BINDING SITE is

HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0972, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0972 BINDING SITE, designated SEQ ID:17226, to the nucleotide sequence of VGAM1453 RNA, herein designated VGAM RNA, also designated SEQ ID:4164.

[50511] Another function of VGAM1453 is therefore inhibition of KIAA0972 (Accession NM_014930). Accordingly, utilities of VGAM1453 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0972. KIAA1056 (Accession NM_014894) is another VGAM1453 host target gene. KIAA1056 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1056, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1056 BINDING SITE, designated SEQ ID:17047, to the nucleotide sequence of VGAM1453 RNA, herein designated VGAM RNA, also designated SEQ ID:4164.

[50512] Another function of VGAM1453 is therefore inhibition of

KIAA1056 (Accession NM_014894). Accordingly, utilities of VGAM1453 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1056. KIAA1871 (Accession XM_028409) is another VGAM1453 host target gene. KIAA1871 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1871, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1871 BINDING SITE, designated SEQ ID:30704, to the nucleotide sequence of VGAM1453 RNA, herein designated VGAM RNA, also designated SEQ ID:4164.

[50513] Another function of VGAM1453 is therefore inhibition of KIAA1871 (Accession XM_028409). Accordingly, utilities of VGAM1453 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1871. MAN1 (Accession NM_014319) is another VGAM1453 host target gene. MAN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of MAN1 BINDING SITE, designated SEQ ID:15616, to the nucleotide sequence of VGAM1453 RNA, herein designated VGAM RNA, also designated SEQ ID:4164.

[50514] Another function of VGAM1453 is therefore inhibition of MAN1 (Accession NM_014319). Accordingly, utilities of VGAM1453 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAN1. Mitochondrial Ribosomal Protein S18B (MRPS18B, Accession NM_014046) is another VGAM1453 host target gene. MRPS18B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MRPS18B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MRPS18B BINDING SITE, designated SEQ ID:15274, to the nucleotide sequence of VGAM1453 RNA, herein designated VGAM RNA, also designated SEQ ID:4164.

[50515] Another function of VGAM1453 is therefore inhibition of Mitochondrial Ribosomal Protein S18B (MRPS18B, Accession NM_014046). Accordingly, utilities of VGAM1453 include diagnosis, prevention and treatment of diseases and

clinical conditions associated with MRPS18B. ZAK (Accession NM_133646) is another VGAM1453 host target gene. ZAK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZAK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZAK BINDING SITE, designated SEQ ID:28605, to the nucleotide sequence of VGAM1453 RNA, herein designated VGAM RNA, also designated SEQ ID:4164.

[50516] Another function of VGAM1453 is therefore inhibition of ZAK (Accession NM_133646). Accordingly, utilities of VGAM1453 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZAK. LOC142779 (Accession XM_084337) is another VGAM1453 host target gene. LOC142779 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC142779, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC142779 BINDING SITE, designated SEQ ID:37559, to the nucleotide sequence of VGAM1453 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4164.

[50517] Another function of VGAM1453 is therefore inhibition of LOC142779 (Accession XM_084337). Accordingly, utilities of VGAM1453 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC142779. LOC143381 (Accession XM_084501) is another VGAM1453 host target gene. LOC143381 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC143381, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143381 BINDING SITE, designated SEQ ID:37613, to the nucleotide sequence of VGAM1453 RNA, herein designated VGAM RNA, also designated SEQ ID:4164.

[50518] Another function of VGAM1453 is therefore inhibition of LOC143381 (Accession XM_084501). Accordingly, utilities of VGAM1453 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143381. LOC148823 (Accession NM_145278) is another VGAM1453 host target gene. LOC148823 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148823, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148823 BINDING SITE, designated SEQ ID:29793, to the nucleotide sequence of VGAM1453 RNA, herein designated VGAM RNA, also designated SEQ ID:4164.

[50519] Another function of VGAM1453 is therefore inhibition of LOC148823 (Accession NM_145278). Accordingly, utilities of VGAM1453 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148823. LOC159036 (Accession XM_099018) is another VGAM1453 host target gene. LOC159036 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC159036, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC159036 BINDING SITE, designated SEQ ID:42052, to the nucleotide sequence of VGAM1453 RNA, herein designated VGAM RNA, also designated SEQ ID:4164.

[50520] Another function of VGAM1453 is therefore inhibition of LOC159036 (Accession XM_099018). Accordingly, utilities of VGAM1453 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC159036. LOC161823 (Accession XM_091156) is another VGAM1453 host target gene. LOC161823 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC161823, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC161823 BINDING SITE, designated SEQ ID:40033, to the nucleotide sequence of VGAM1453 RNA, herein designated VGAM RNA, also designated SEQ ID:4164.

[50521] Another function of VGAM1453 is therefore inhibition of LOC161823 (Accession XM_091156). Accordingly, utilities of VGAM1453 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC161823. LOC203350 (Accession XM_117536) is another VGAM1453 host target gene. LOC203350 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203350, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203350 BINDING SITE, designated SEQ ID:43532, to

the nucleotide sequence of VGAM1453 RNA, herein designated VGAM RNA, also designated SEQ ID:4164.

[50522] Another function of VGAM1453 is therefore inhibition of LOC203350 (Accession XM_117536). Accordingly, utilities of VGAM1453 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203350. LOC257464 (Accession XM_116972) is another VGAM1453 host target gene. LOC257464 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257464, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257464 BINDING SITE, designated SEQ ID:43165, to the nucleotide sequence of VGAM1453 RNA, herein designated VGAM RNA, also designated SEQ ID:4164.

[50523] Another function of VGAM1453 is therefore inhibition of LOC257464 (Accession XM_116972). Accordingly, utilities of VGAM1453 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257464. LOC257482 (Accession XM_168544) is another VGAM1453 host target gene. LOC257482 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC257482, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257482 BINDING SITE, designated SEQ ID:45235, to the nucleotide sequence of VGAM1453 RNA, herein designated VGAM RNA, also designated SEQ ID:4164.

[50524] Another function of VGAM1453 is therefore inhibition of LOC257482 (Accession XM_168544). Accordingly, utilities of VGAM1453 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257482. LOC90288 (Accession XM_030669) is another VGAM1453 host target gene. LOC90288 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90288, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90288 BINDING SITE, designated SEQ ID:31113, to the nucleotide sequence of VGAM1453 RNA, herein designated VGAM RNA, also designated SEQ ID:4164.

[50525] Another function of VGAM1453 is therefore inhibition of LOC90288 (Accession XM_030669). Accordingly, utilities

of VGAM1453 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90288. LOC92228 (Accession XM_043731) is another VGAM1453 host target gene. LOC92228 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92228, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92228 BINDING SITE, designated SEQ ID:34003, to the nucleotide sequence of VGAM1453 RNA, herein designated VGAM RNA, also designated SEQ ID:4164.

[50526] Another function of VGAM1453 is therefore inhibition of LOC92228 (Accession XM_043731). Accordingly, utilities of VGAM1453 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92228. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1454 (VGAM1454) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50527] VGAM1454 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1454 was detected is described hereinabove with reference to Figs. 1–8.

[50528] VGAM1454 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM1454 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50529] VGAM1454 gene encodes a VGAM1454 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1454 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1454 precursor RNA is designated SEQ ID:1440, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1440 is located at position 41662 relative to the genome of Equine Herpesvirus 2.

[50530] VGAM1454 precursor RNA folds onto itself, forming VGAM1454 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50531] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1454 folded precursor RNA into VGAM1454 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide sequence of VGAM1454 RNA is designated SEQ ID:4165, and is provided hereinbelow with reference to the sequence listing part.

[50532] VGAM1454 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1454 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1454 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[50533] VGAM1454 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1454 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1454 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1454 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1454 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[50534] The complementary binding of VGAM1454 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1454 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1454 host target RNA into VGAM1454 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50535] It is appreciated that VGAM1454 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1454 host target genes. The mRNA of each one of this plurality of VGAM1454 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1454 RNA, herein designated VGAM RNA, and which when bound by VGAM1454 RNA causes inhibition of translation of respective one or more VGAM1454 host target proteins.

[50536] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1454 gene, herein designated VGAM GENE, on one or more VGAM1454 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[50537] It is yet further appreciated that a function of VGAM1454 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1454 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1454 correlate with, and may be deduced from, the identity of the host target genes which VGAM1454 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50538] Nucleotide sequences of the VGAM1454 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the
`diced` VGAM1454 RNA, herein designated VGAM RNA,
and a schematic representation of the secondary folding
of VGAM1454 folded precursor RNA, herein designated
VGAM FOLDED PRECURSOR RNA, of VGAM1454 are further
described hereinbelow with reference to Table 1.

[50539] Nucleotide sequences of host target binding sites, such as
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of
Fig. 1, found on VGAM1454 host target RNA, and
schematic representation of the complementarity of each
of these host target binding sites to VGAM1454 RNA,
herein designated VGAM RNA, are described hereinbelow
with reference to Table 2.

[50540] As mentioned hereinabove with reference to Fig. 1, a
function of VGAM1454 gene, herein designated VGAM is
inhibition of expression of VGAM1454 target genes. It is
appreciated that specific functions, and accordingly utili-
ties, of VGAM1454 correlate with, and may be deduced
from, the identity of the target genes which VGAM1454
binds and inhibits, and the function of these target genes,
as elaborated hereinbelow.

[50541] CD244 (Accession NM_016382) is a VGAM1454 host tar-
get gene. CD244 BINDING SITE is HOST TARGET binding

site found in the 3` untranslated region of mRNA encoded by CD244, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CD244 BINDING SITE, designated SEQ ID:18524, to the nucleotide sequence of VGAM1454 RNA, herein designated VGAM RNA, also designated SEQ ID:4165.

[50542] A function of VGAM1454 is therefore inhibition of CD244 (Accession NM_016382), a gene which can interfere with a step as proximal as phosphorylation of an activation receptor. Accordingly, utilities of VGAM1454 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD244. The function of CD244 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1224. Heparan Sulfate (glucosamine) 3-O-sulfotransferase 3A1 (HS3ST3A1, Accession NM_006042) is another VGAM1454 host target gene. HS3ST3A1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by HS3ST3A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HS3ST3A1 BINDING SITE, designated SEQ ID:12679, to the nucleotide sequence of VGAM1454 RNA, herein designated VGAM RNA, also designated SEQ ID:4165.

[50543] Another function of VGAM1454 is therefore inhibition of Heparan Sulfate (glucosamine) 3-O-sulfotransferase 3A1 (HS3ST3A1, Accession NM_006042), a gene which plays a role in the generation of heparan sulfate proteoglycan. Accordingly, utilities of VGAM1454 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HS3ST3A1. The function of HS3ST3A1 has been established by previous studies. Heparan sulfate biosynthetic enzymes are key components in generating a myriad of distinct heparan sulfate fine structures that carry out multiple biologic activities. The heparan sulfate D-glucosaminyl 3-O-sulfotransferases (3OSTs) place the rare 3-O-sulfate group in various sequence contexts. See 3OST2 (OMIM Ref. No. 604056). Shworak et al. (1999) isolated cDNAs encoding 3OST2, 3OST3A1, 3OST3B1 (OMIM Ref. No. 604058), and 3OST4 (OMIM Ref. No. 604059). Like 3OST2 and 3OST3B1, the predicted 406-amino acid 3OST3A1 protein is a predicted

type II integral membrane protein. Although the 3OST2 and 3OST3 enzymes have a similar regional organization, the only region of significant sequence homology occurs in the sulfotransferase domains. On the DNA level, the coding regions for the 3OST3A1 and 3OST3B1 sulfotransferase domains are nearly identical, and they share approximately 72% identity with those of 3OST2 and 3OST4. Southern blot analysis revealed that the human genome contains 2 copies of the 3OST3A and 3OST3B genes. The authors stated that they were unable to assess the functionality of the duplicate genes, which they named 3OST3A2 and 3OST3B2. Northern blot analysis revealed that the 3OST3A gene was widely expressed as multiple transcripts, with the most abundant expression in heart and placenta. In a companion paper, Liu et al. (1999) demonstrated that while the 3OST1, 3OST2, and 3OST3 isoforms each generate unique 3-O-sulfated structures, the 3OST3A and 3OST3B isoforms sulfate an identical disaccharide. Shworak et al. (1999) concluded that the 3OST multigene family encodes key enzymes that regulate the production of many distinct heparan sulfate fine structures. By inclusion within mapped clones, Shworak et al. (1999) mapped the 3OST3A1 and 3OST3B1 genes to

17p12–p11.2. Using interspecific backcross analysis, they mapped the mouse 3Ost3A and 3Ost3B genes to chromosome 11. Shworak et al. (1999) stated that the tight linkage between the 2 genes in the mouse genome suggests that they arose by a tandem duplication.

[50544] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[50545] Liu, J.; Shworak, N. W.; Sinay, P.; Schwartz, J. J.; Zhang, L.; Fritze, L. M.; Rosenberg, R. D. : Expression of heparan sulfate D–glucosaminyl 3–O–sulfotransferase isoforms reveals novel substrate specificities. J. Biol. Chem. 274: 5185–5192, 1999. ; and

[50546] Shworak, N. W.; Liu, J.; Petros, L. M.; Zhang, L.; Kobayashi, M.; Copeland, N. G.; Jenkins, N. A.; Rosenberg, R. D. : Multiple isoforms of heparan sulfate D–glucosaminyl 3–O–sulfotransfera.

[50547] Further studies establishing the function and utilities of HS3ST3A1 are found in John Hopkins OMIM database record ID 604057, and in cited publications numbered 5054–5055 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Periaxin (PRX, Accession NM_020956) is another VGAM1454 host

target gene. PRX BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRX, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRX BINDING SITE, designated SEQ ID:21933, to the nucleotide sequence of VGAM1454 RNA, herein designated VGAM RNA, also designated SEQ ID:4165.

[50548] Another function of VGAM1454 is therefore inhibition of Periaxin (PRX, Accession NM_020956), a gene which seems to be required for maintenance of peripheral nerve myelin sheath. may have a role in axon-glial interactions, possibly by interacting with the cytoplasmic domains of integral membrane proteins such as myelin-associated glycoprotein in the periaxonal regions of the schwann cell plasma membrane. may have a role in the early phases of myelin deposition. Accordingly, utilities of VGAM1454 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRX. The function of PRX and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM476.RAS, Dexamethasone-induced 1 (RASD1, Accession

NM_016084) is another VGAM1454 host target gene. RASD1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by RASD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RASD1 BINDING SITE, designated SEQ ID:18168, to the nucleotide sequence of VGAM1454 RNA, herein designated VGAM RNA, also designated SEQ ID:4165.

[50549] Another function of VGAM1454 is therefore inhibition of RAS, Dexamethasone-induced 1 (RASD1, Accession NM_016084), a gene which is a novel physiologic NO effector. Accordingly, utilities of VGAM1454 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RASD1. The function of RASD1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM168. Solute Carrier Family 4, Sodium Bicarbonate Transporter-like, Member 10 (SLC4A10, Accession NM_022058) is another VGAM1454 host target gene. SLC4A10 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by SLC4A10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC4A10 BINDING SITE, designated SEQ ID:22594, to the nucleotide sequence of VGAM1454 RNA, herein designated VGAM RNA, also designated SEQ ID:4165.

[50550] Another function of VGAM1454 is therefore inhibition of Solute Carrier Family 4, Sodium Bicarbonate Transporter-like, Member 10 (SLC4A10, Accession NM_022058). Accordingly, utilities of VGAM1454 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC4A10. Sphingosine Kinase 2 (SPHK2, Accession NM_020126) is another VGAM1454 host target gene. SPHK2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SPHK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPHK2 BINDING SITE, designated SEQ ID:21312, to the nucleotide sequence of VGAM1454 RNA, herein designated VGAM RNA, also designated SEQ ID:4165.

[50551] Another function of VGAM1454 is therefore inhibition of Sphingosine Kinase 2 (SPHK2, Accession NM_020126). Accordingly, utilities of VGAM1454 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPHK2. Transglutaminase 2 (C polypeptide, protein-glutamine-gamma-glutamyltransferase) (TGM2, Accession NM_004613) is another VGAM1454 host target gene. TGM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TGM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TGM2 BINDING SITE, designated SEQ ID:10952, to the nucleotide sequence of VGAM1454 RNA, herein designated VGAM RNA, also designated SEQ ID:4165.

[50552] Another function of VGAM1454 is therefore inhibition of Transglutaminase 2 (C polypeptide, protein-glutamine-gamma-glutamyltransferase) (TGM2, Accession NM_004613), a gene which catalyzes the cross-linking of proteins and the conjugation of polyamines to proteins. Accordingly, utilities of VGAM1454 include diagnosis, prevention and treatment of diseases and clinical condi-

tions associated with TGM2. The function of TGM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM899. Zinc Finger Protein 278 (ZNF278, Accession NM_032052) is another VGAM1454 host target gene. ZNF278 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF278, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF278 BINDING SITE, designated SEQ ID:25783, to the nucleotide sequence of VGAM1454 RNA, herein designated VGAM RNA, also designated SEQ ID:4165.

[50553] Another function of VGAM1454 is therefore inhibition of Zinc Finger Protein 278 (ZNF278, Accession NM_032052), a gene which represses basal transcription as well as RNF4-mediated activation. Accordingly, utilities of VGAM1454 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF278. The function of ZNF278 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with

reference to VGAM414.APCL (Accession NM_005883) is another VGAM1454 host target gene. APCL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by APCL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APCL BINDING SITE, designated SEQ ID:12497, to the nucleotide sequence of VGAM1454 RNA, herein designated VGAM RNA, also designated SEQ ID:4165.

[50554] Another function of VGAM1454 is therefore inhibition of APCL (Accession NM_005883). Accordingly, utilities of VGAM1454 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APCL. CGRP-RCP (Accession NM_014478) is another VGAM1454 host target gene. CGRP-RCP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CGRP-RCP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CGRP-RCP BINDING SITE, designated SEQ ID:15822, to the nucleotide sequence of VGAM1454 RNA, herein designated VGAM RNA,

also designated SEQ ID:4165.

[50555] Another function of VGAM1454 is therefore inhibition of CGRP-RCP (Accession NM_014478). Accordingly, utilities of VGAM1454 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CGRP-RCP. DKFZP564M182 (Accession XM_085525) is another VGAM1454 host target gene. DKFZP564M182 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564M182, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564M182 BINDING SITE, designated SEQ ID:38218, to the nucleotide sequence of VGAM1454 RNA, herein designated VGAM RNA, also designated SEQ ID:4165.

[50556] Another function of VGAM1454 is therefore inhibition of DKFZP564M182 (Accession XM_085525). Accordingly, utilities of VGAM1454 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564M182. KIAA1171 (Accession XM_113868) is another VGAM1454 host target gene. KIAA1171 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by KIAA1171, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1171 BINDING SITE, designated SEQ ID:42482, to the nucleotide sequence of VGAM1454 RNA, herein designated VGAM RNA, also designated SEQ ID:4165.

[50557] Another function of VGAM1454 is therefore inhibition of KIAA1171 (Accession XM_113868). Accordingly, utilities of VGAM1454 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1171. Lipase, Endothelial (LIPG, Accession NM_006033) is another VGAM1454 host target gene. LIPG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LIPG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LIPG BINDING SITE, designated SEQ ID:12654, to the nucleotide sequence of VGAM1454 RNA, herein designated VGAM RNA, also designated SEQ ID:4165.

[50558] Another function of VGAM1454 is therefore inhibition of Lipase, Endothelial (LIPG, Accession NM_006033). Accord-

ingly, utilities of VGAM1454 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIPG. MGC10715 (Accession NM_024325) is another VGAM1454 host target gene. MGC10715 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC10715, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC10715 BINDING SITE, designated SEQ ID:23615, to the nucleotide sequence of VGAM1454 RNA, herein designated VGAM RNA, also designated SEQ ID:4165.

[50559] Another function of VGAM1454 is therefore inhibition of MGC10715 (Accession NM_024325). Accordingly, utilities of VGAM1454 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10715. MGC4504 (Accession NM_024111) is another VGAM1454 host target gene. MGC4504 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC4504, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4504

BINDING SITE, designated SEQ ID:23560, to the nucleotide sequence of VGAM1454 RNA, herein designated VGAM RNA, also designated SEQ ID:4165.

[50560] Another function of VGAM1454 is therefore inhibition of MGC4504 (Accession NM_024111). Accordingly, utilities of VGAM1454 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4504. LOC142955 (Accession XM_084389) is another VGAM1454 host target gene. LOC142955 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC142955, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC142955 BINDING SITE, designated SEQ ID:37572, to the nucleotide sequence of VGAM1454 RNA, herein designated VGAM RNA, also designated SEQ ID:4165.

[50561] Another function of VGAM1454 is therefore inhibition of LOC142955 (Accession XM_084389). Accordingly, utilities of VGAM1454 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC142955. LOC165257 (Accession XM_092478) is another VGAM1454 host target gene. LOC165257 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC165257, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC165257 BINDING SITE, designated SEQ ID:40128, to the nucleotide sequence of VGAM1454 RNA, herein designated VGAM RNA, also designated SEQ ID:4165.

[50562] Another function of VGAM1454 is therefore inhibition of LOC165257 (Accession XM_092478). Accordingly, utilities of VGAM1454 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC165257. LOC91266 (Accession XM_037268) is another VGAM1454 host target gene. LOC91266 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91266, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91266 BINDING SITE, designated SEQ ID:32601, to the nucleotide sequence of VGAM1454 RNA, herein designated VGAM RNA, also designated SEQ ID:4165.

[50563] Another function of VGAM1454 is therefore inhibition of

LOC91266 (Accession XM_037268). Accordingly, utilities of VGAM1454 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91266. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1455 (VGAM1455) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50564] VGAM1455 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1455 was detected is described hereinabove with reference to Figs. 1-8.

[50565] VGAM1455 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM1455 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50566] VGAM1455 gene encodes a VGAM1455 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1455 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1455 precursor RNA is designated SEQ ID:1441, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1441 is located at position 42997 relative to the genome of Equine Herpesvirus 2.

- [50567] VGAM1455 precursor RNA folds onto itself, forming VGAM1455 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [50568] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1455 folded precursor RNA into VGAM1455 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 65%) nucleotide se-

quence of VGAM1455 RNA is designated SEQ ID:4166, and is provided hereinbelow with reference to the sequence listing part.

[50569] VGAM1455 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1455 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1455 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[50570] VGAM1455 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1455 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1455 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM1455 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1455 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[50571] The complementary binding of VGAM1455 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1455 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1455 host target RNA into VGAM1455 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50572] It is appreciated that VGAM1455 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1455 host target genes. The mRNA of each one of this plurality of VGAM1455 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1455 RNA, herein designated VGAM RNA, and which when bound by VGAM1455 RNA causes inhibition of translation of respective one or more VGAM1455 host target proteins.

[50573] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1455 gene, herein designated VGAM GENE, on one or more VGAM1455 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[50574] It is yet further appreciated that a function of VGAM1455

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1455 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1455 correlate with, and may be deduced from, the identity of the host target genes which VGAM1455 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50575] Nucleotide sequences of the VGAM1455 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1455 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1455 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1455 are further described hereinbelow with reference to Table 1.

[50576] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1455 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1455 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50577] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1455 gene, herein designated VGAM is inhibition of expression of VGAM1455 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1455 correlate with, and may be deduced from, the identity of the target genes which VGAM1455 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[50578] Vitamin D (1,25– dihydroxyvitamin D3) Receptor (VDR, Accession NM_000376) is a VGAM1455 host target gene. VDR BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by VDR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VDR BINDING SITE, designated SEQ ID:5946, to the nucleotide sequence of VGAM1455 RNA, herein designated VGAM RNA, also designated SEQ ID:4166.

[50579] A function of VGAM1455 is therefore inhibition of Vitamin D (1,25– dihydroxyvitamin D3) Receptor (VDR, Accession NM_000376). Accordingly, utilities of VGAM1455 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VDR. FLJ20281 (Accession

XM_165663) is another VGAM1455 host target gene. FLJ20281 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ20281, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20281 BINDING SITE, designated SEQ ID:43726, to the nucleotide sequence of VGAM1455 RNA, herein designated VGAM RNA, also designated SEQ ID:4166.

[50580] Another function of VGAM1455 is therefore inhibition of FLJ20281 (Accession XM_165663). Accordingly, utilities of VGAM1455 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20281. Solute Carrier Family 26, Member 7 (SLC26A7, Accession NM_052832) is another VGAM1455 host target gene. SLC26A7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC26A7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC26A7 BINDING SITE, designated SEQ ID:27416, to the nucleotide sequence of VGAM1455 RNA,

herein designated VGAM RNA, also designated SEQ ID:4166.

[50581] Another function of VGAM1455 is therefore inhibition of Solute Carrier Family 26, Member 7 (SLC26A7, Accession NM_052832). Accordingly, utilities of VGAM1455 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC26A7. LOC134266 (Accession XM_059701) is another VGAM1455 host target gene. LOC134266 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC134266, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC134266 BINDING SITE, designated SEQ ID:37067, to the nucleotide sequence of VGAM1455 RNA, herein designated VGAM RNA, also designated SEQ ID:4166.

[50582] Another function of VGAM1455 is therefore inhibition of LOC134266 (Accession XM_059701). Accordingly, utilities of VGAM1455 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC134266. LOC144438 (Accession XM_084860) is another VGAM1455 host target gene. LOC144438 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC144438, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144438 BINDING SITE, designated SEQ ID:37736, to the nucleotide sequence of VGAM1455 RNA, herein designated VGAM RNA, also designated SEQ ID:4166.

[50583] Another function of VGAM1455 is therefore inhibition of LOC144438 (Accession XM_084860). Accordingly, utilities of VGAM1455 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144438. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1456 (VGAM1456) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50584] VGAM1456 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1456 was detected is described hereinabove with reference to Figs. 1-8.

[50585] VGAM1456 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM1456 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50586] VGAM1456 gene encodes a VGAM1456 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1456 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1456 precursor RNA is designated SEQ ID:1442, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1442 is located at position 39288 relative to the genome of Equine Herpesvirus 2.

[50587] VGAM1456 precursor RNA folds onto itself, forming VGAM1456 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[50588] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1456 folded precursor RNA into VGAM1456 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1456 RNA is designated SEQ ID:4167, and is provided hereinbelow with reference to the sequence listing part.

[50589] VGAM1456 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1456 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1456 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[50590] VGAM1456 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1456 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1456 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1456 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1456 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[50591] The complementary binding of VGAM1456 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1456 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1456 host target RNA into VGAM1456 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50592] It is appreciated that VGAM1456 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1456 host target genes. The mRNA of each one of this plurality of VGAM1456 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1456 RNA, herein designated VGAM RNA, and which when bound by VGAM1456 RNA causes inhibition of translation of respective one or more VGAM1456 host target proteins.

[50593] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1456 gene, herein designated VGAM GENE, on one or more VGAM1456 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[50594] It is yet further appreciated that a function of VGAM1456 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1456 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1456 correlate with, and may be deduced from, the identity of the host target genes which VGAM1456 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50595] Nucleotide sequences of the VGAM1456 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1456 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1456 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1456 are further described hereinbelow with reference to Table 1.

[50596] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1456 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1456 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50597] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1456 gene, herein designated VGAM is inhibition of expression of VGAM1456 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1456 correlate with, and may be deduced from, the identity of the target genes which VGAM1456 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[50598] Fatty-acid-Coenzyme A Ligase, Long-chain 2 (FACL2, Accession NM_021122) is a VGAM1456 host target gene. FACL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FACL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of FACL2 BINDING SITE, designated SEQ ID:22096, to the nucleotide sequence of VGAM1456 RNA, herein designated VGAM RNA, also designated SEQ ID:4167.

[50599] A function of VGAM1456 is therefore inhibition of Fatty-acid-Coenzyme A Ligase, Long-chain 2 (FACL2, Accession NM_021122), a gene which activates long-chain fatty acids for both synthesis of cellular lipids. Accordingly, utilities of VGAM1456 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FACL2. The function of FACL2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM172. Polycystic Kidney and Hepatic Disease 1 (autosomal recessive) (PKHD1, Accession NM_138694) is another VGAM1456 host target gene. PKHD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PKHD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PKHD1 BINDING SITE, designated SEQ

ID:28936, to the nucleotide sequence of VGAM1456 RNA, herein designated VGAM RNA, also designated SEQ ID:4167.

[50600] Another function of VGAM1456 is therefore inhibition of Polycystic Kidney and Hepatic Disease 1 (autosomal recessive) (PKHD1, Accession NM_138694). Accordingly, utilities of VGAM1456 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PKHD1. ARL8 (Accession XM_167671) is another VGAM1456 host target gene. ARL8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARL8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARL8 BINDING SITE, designated SEQ ID:44760, to the nucleotide sequence of VGAM1456 RNA, herein designated VGAM RNA, also designated SEQ ID:4167.

[50601] Another function of VGAM1456 is therefore inhibition of ARL8 (Accession XM_167671). Accordingly, utilities of VGAM1456 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARL8. DKFZp547H025 (Accession NM_020161) is another

VGAM1456 host target gene. DKFZp547H025 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp547H025, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp547H025 BINDING SITE, designated SEQ ID:21370, to the nucleotide sequence of VGAM1456 RNA, herein designated VGAM RNA, also designated SEQ ID:4167.

[50602] Another function of VGAM1456 is therefore inhibition of DKFZp547H025 (Accession NM_020161). Accordingly, utilities of VGAM1456 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547H025. DKFZP761F241 (Accession NM_031455) is another VGAM1456 host target gene. DKFZP761F241 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP761F241, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP761F241 BINDING SITE, designated SEQ ID:25476, to the nucleotide sequence of

VGAM1456 RNA, herein designated VGAM RNA, also designated SEQ ID:4167.

[50603] Another function of VGAM1456 is therefore inhibition of DKFZP761F241 (Accession NM_031455). Accordingly, utilities of VGAM1456 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP761F241. FLJ13881 (Accession NM_024729) is another VGAM1456 host target gene. FLJ13881 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13881, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13881 BINDING SITE, designated SEQ ID:24068, to the nucleotide sequence of VGAM1456 RNA, herein designated VGAM RNA, also designated SEQ ID:4167.

[50604] Another function of VGAM1456 is therefore inhibition of FLJ13881 (Accession NM_024729). Accordingly, utilities of VGAM1456 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13881. FLJ22644 (Accession NM_025098) is another VGAM1456 host target gene. FLJ22644 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by FLJ22644, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22644 BINDING SITE, designated SEQ ID:24740, to the nucleotide sequence of VGAM1456 RNA, herein designated VGAM RNA, also designated SEQ ID:4167.

[50605] Another function of VGAM1456 is therefore inhibition of FLJ22644 (Accession NM_025098). Accordingly, utilities of VGAM1456 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22644. KIAA0258 (Accession NM_014785) is another VGAM1456 host target gene. KIAA0258 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0258, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0258 BINDING SITE, designated SEQ ID:16644, to the nucleotide sequence of VGAM1456 RNA, herein designated VGAM RNA, also designated SEQ ID:4167.

[50606] Another function of VGAM1456 is therefore inhibition of KIAA0258 (Accession NM_014785). Accordingly, utilities

of VGAM1456 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0258. KIAA0296 (Accession NM_014699) is another VGAM1456 host target gene. KIAA0296 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0296, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0296 BINDING SITE, designated SEQ ID:16217, to the nucleotide sequence of VGAM1456 RNA, herein designated VGAM RNA, also designated SEQ ID:4167.

[50607] Another function of VGAM1456 is therefore inhibition of KIAA0296 (Accession NM_014699). Accordingly, utilities of VGAM1456 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0296. KIAA1100 (Accession NM_014901) is another VGAM1456 host target gene. KIAA1100 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1100, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA1100 BINDING SITE, designated SEQ ID:17083, to the nucleotide sequence of VGAM1456 RNA, herein designated VGAM RNA, also designated SEQ ID:4167.

[50608] Another function of VGAM1456 is therefore inhibition of KIAA1100 (Accession NM_014901). Accordingly, utilities of VGAM1456 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1100. Solute Carrier Family 25 (mitochondrial oxodicarboxylate carrier), Member 21 (SLC25A21, Accession NM_030631) is another VGAM1456 host target gene. SLC25A21 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC25A21, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC25A21 BINDING SITE, designated SEQ ID:24966, to the nucleotide sequence of VGAM1456 RNA, herein designated VGAM RNA, also designated SEQ ID:4167.

[50609] Another function of VGAM1456 is therefore inhibition of Solute Carrier Family 25 (mitochondrial oxodicarboxylate carrier), Member 21 (SLC25A21, Accession NM_030631). Accordingly, utilities of VGAM1456 include diagnosis,

prevention and treatment of diseases and clinical conditions associated with SLC25A21. LOC149372 (Accession XM_086509) is another VGAM1456 host target gene.

LOC149372 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149372, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149372 BINDING SITE, designated SEQ ID:38729, to the nucleotide sequence of VGAM1456 RNA, herein designated VGAM RNA, also designated SEQ ID:4167.

[50610] Another function of VGAM1456 is therefore inhibition of LOC149372 (Accession XM_086509). Accordingly, utilities of VGAM1456 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149372. LOC154860 (Accession XM_098623) is another VGAM1456 host target gene. LOC154860 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC154860, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC154860 BINDING SITE, designated SEQ ID:41735, to the nucleotide sequence of VGAM1456 RNA, herein designated VGAM RNA, also designated SEQ ID:4167.

[50611] Another function of VGAM1456 is therefore inhibition of LOC154860 (Accession XM_098623). Accordingly, utilities of VGAM1456 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154860. LOC197358 (Accession XM_113872) is another VGAM1456 host target gene. LOC197358 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC197358, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197358 BINDING SITE, designated SEQ ID:42505, to the nucleotide sequence of VGAM1456 RNA, herein designated VGAM RNA, also designated SEQ ID:4167.

[50612] Another function of VGAM1456 is therefore inhibition of LOC197358 (Accession XM_113872). Accordingly, utilities of VGAM1456 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197358. LOC257177 (Accession XM_170909) is another VGAM1456 host target gene. LOC257177 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257177, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257177 BINDING SITE, designated SEQ ID:45675, to the nucleotide sequence of VGAM1456 RNA, herein designated VGAM RNA, also designated SEQ ID:4167.

[50613] Another function of VGAM1456 is therefore inhibition of LOC257177 (Accession XM_170909). Accordingly, utilities of VGAM1456 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257177. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1457 (VGAM1457) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50614] VGAM1457 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1457 was detected is described hereinabove with reference to Figs. 1-8.

[50615] VGAM1457 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM1457 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50616] VGAM1457 gene encodes a VGAM1457 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1457 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1457 precursor RNA is designated SEQ ID:1443, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1443 is located at position 43126 relative to the genome of Equine Herpesvirus 2.

[50617] VGAM1457 precursor RNA folds onto itself, forming VGAM1457 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[50618] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1457 folded precursor RNA into VGAM1457 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1457 RNA is designated SEQ ID:4168, and is provided hereinbelow with reference to the sequence listing part.

[50619] VGAM1457 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1457 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1457 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[50620] VGAM1457 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1457 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1457 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1457 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1457 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[50621] The complementary binding of VGAM1457 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1457 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1457 host target RNA into VGAM1457 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50622] It is appreciated that VGAM1457 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1457 host target genes. The mRNA of each one of this plurality of VGAM1457 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1457 RNA, herein designated VGAM RNA, and which when bound by VGAM1457 RNA causes inhibition of translation of respective one or more VGAM1457 host target proteins.

[50623] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1457 gene, herein designated VGAM GENE, on one or more VGAM1457 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[50624] It is yet further appreciated that a function of VGAM1457 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1457 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1457 correlate with, and may be deduced from, the identity of the host target genes which VGAM1457 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50625] Nucleotide sequences of the VGAM1457 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1457 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1457 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1457 are further described hereinbelow with reference to Table 1.

[50626] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1457 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1457 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50627] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1457 gene, herein designated VGAM is inhibition of expression of VGAM1457 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1457 correlate with, and may be deduced from, the identity of the target genes which VGAM1457 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[50628] Zinc Finger Protein 146 (ZNF146, Accession NM_007145) is a VGAM1457 host target gene. ZNF146 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ZNF146, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of ZNF146 BINDING SITE, designated SEQ ID:13993, to the nucleotide sequence of VGAM1457 RNA, herein designated VGAM RNA, also designated SEQ ID:4168.

[50629] A function of VGAM1457 is therefore inhibition of Zinc Finger Protein 146 (ZNF146, Accession NM_007145), a gene which binds zinc ions, DNA, and heparin. Accordingly, utilities of VGAM1457 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF146. The function of ZNF146 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM192.KIAA0063 (Accession NM_014876) is another VGAM1457 host target gene. KIAA0063 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0063, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0063 BINDING SITE, designated SEQ ID:17015, to the nucleotide sequence of VGAM1457 RNA, herein designated VGAM RNA, also designated SEQ ID:4168.

[50630] Another function of VGAM1457 is therefore inhibition of KIAA0063 (Accession NM_014876). Accordingly, utilities of VGAM1457 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0063. KIAA0676 (Accession NM_015043) is another VGAM1457 host target gene. KIAA0676 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0676, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0676 BINDING SITE, designated SEQ ID:17391, to the nucleotide sequence of VGAM1457 RNA, herein designated VGAM RNA, also designated SEQ ID:4168.

[50631] Another function of VGAM1457 is therefore inhibition of KIAA0676 (Accession NM_015043). Accordingly, utilities of VGAM1457 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0676. Neurexophilin 3 (NXPH3, Accession XM_037847) is another VGAM1457 host target gene. NXPH3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NXPH3, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NXPH3 BINDING SITE, designated SEQ ID:32711, to the nucleotide sequence of VGAM1457 RNA, herein designated VGAM RNA, also designated SEQ ID:4168.

[50632] Another function of VGAM1457 is therefore inhibition of Neurexophilin 3 (NXPH3, Accession XM_037847). Accordingly, utilities of VGAM1457 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NXPH3. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1458 (VGAM1458) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50633] VGAM1458 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1458 was detected is described hereinabove with reference to Figs. 1–8.

[50634] VGAM1458 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2.

VGAM1458 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50635] VGAM1458 gene encodes a VGAM1458 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1458 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1458 precursor RNA is designated SEQ ID:1444, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1444 is located at position 39736 relative to the genome of Equine Herpesvirus 2.

[50636] VGAM1458 precursor RNA folds onto itself, forming VGAM1458 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50637] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM1458 folded precursor RNA into VGAM1458 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM1458 RNA is designated SEQ ID:4169, and is provided hereinbelow with reference to the sequence listing part.

[50638] VGAM1458 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1458 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1458 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[50639] VGAM1458 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1458 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1458 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1458 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1458 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[50640] The complementary binding of VGAM1458 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1458 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1458 host target RNA into VGAM1458 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50641] It is appreciated that VGAM1458 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1458 host target genes. The mRNA of each one of this plurality of VGAM1458 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1458 RNA, herein designated VGAM RNA, and which when bound by VGAM1458 RNA causes inhibition of translation of respective one or more VGAM1458 host target proteins.

[50642] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1458 gene, herein designated VGAM GENE, on one or more VGAM1458 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[50643] It is yet further appreciated that a function of VGAM1458 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1458 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1458 correlate with, and may be deduced from, the identity of the host target genes which VGAM1458 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50644] Nucleotide sequences of the VGAM1458 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1458 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1458 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1458 are further described hereinbelow with reference to Table 1.

[50645] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1458 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1458 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50646] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1458 gene, herein designated VGAM is inhibition of expression of VGAM1458 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1458 correlate with, and may be deduced from, the identity of the target genes which VGAM1458 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[50647] Calcitonin Receptor-like (CALCRL, Accession NM_005795) is a VGAM1458 host target gene. CALCRL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CALCRL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CALCRL BINDING SITE, designated SEQ ID:12375, to the nucleotide

sequence of VGAM1458 RNA, herein designated VGAM RNA, also designated SEQ ID:4169.

[50648] A function of VGAM1458 is therefore inhibition of Calcitonin Receptor-like (CALCRL, Accession NM_005795), a gene which is a receptor for calcitonin gene-related peptide type 1. Accordingly, utilities of VGAM1458 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CALCRL. The function of CALCRL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM995. Cyclin-dependent Kinase (CDC2-like) 10 (CDK10, Accession NM_052988) is another VGAM1458 host target gene. CDK10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CDK10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDK10 BINDING SITE, designated SEQ ID:27553, to the nucleotide sequence of VGAM1458 RNA, herein designated VGAM RNA, also designated SEQ ID:4169.

[50649] Another function of VGAM1458 is therefore inhibition of

Cyclin-dependent Kinase (CDC2-like) 10 (CDK10, Accession NM_052988), a gene which plays a pivotal role in the regulation of the eukaryotic cell cycle. Accordingly, utilities of VGAM1458 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDK10. The function of CDK10 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM193.A Disintegrin and Metalloproteinase Domain 9 (meltrin gamma) (ADAM9, Accession NM_003816) is another VGAM1458 host target gene. ADAM9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADAM9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAM9 BINDING SITE, designated SEQ ID:9905, to the nucleotide sequence of VGAM1458 RNA, herein designated VGAM RNA, also designated SEQ ID:4169.

[50650] Another function of VGAM1458 is therefore inhibition of A Disintegrin and Metalloproteinase Domain 9 (meltrin gamma) (ADAM9, Accession NM_003816). Accordingly,

utilities of VGAM1458 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAM9. KIAA1164 (Accession XM_045358) is another VGAM1458 host target gene. KIAA1164 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1164, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1164 BINDING SITE, designated SEQ ID:34439, to the nucleotide sequence of VGAM1458 RNA, herein designated VGAM RNA, also designated SEQ ID:4169.

[50651] Another function of VGAM1458 is therefore inhibition of KIAA1164 (Accession XM_045358). Accordingly, utilities of VGAM1458 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1164. KIAA1211 (Accession XM_044178) is another VGAM1458 host target gene. KIAA1211 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1211, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA1211 BINDING SITE, designated SEQ ID:34158, to the nucleotide sequence of VGAM1458 RNA, herein designated VGAM RNA, also designated SEQ ID:4169.

[50652] Another function of VGAM1458 is therefore inhibition of KIAA1211 (Accession XM_044178). Accordingly, utilities of VGAM1458 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1211. KIAA1458 (Accession XM_044434) is another VGAM1458 host target gene. KIAA1458 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1458, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1458 BINDING SITE, designated SEQ ID:34202, to the nucleotide sequence of VGAM1458 RNA, herein designated VGAM RNA, also designated SEQ ID:4169.

[50653] Another function of VGAM1458 is therefore inhibition of KIAA1458 (Accession XM_044434). Accordingly, utilities of VGAM1458 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1458. MGC5566 (Accession NM_024049) is another VGAM1458 host target gene. MGC5566 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC5566, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC5566 BINDING SITE, designated SEQ ID:23485, to the nucleotide sequence of VGAM1458 RNA, herein designated VGAM RNA, also designated SEQ ID:4169.

[50654] Another function of VGAM1458 is therefore inhibition of MGC5566 (Accession NM_024049). Accordingly, utilities of VGAM1458 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC5566. PANK (Accession NM_138316) is another VGAM1458 host target gene. PANK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PANK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PANK BINDING SITE, designated SEQ ID:28714, to the nucleotide sequence of VGAM1458 RNA, herein designated VGAM RNA, also designated SEQ ID:4169.

[50655] Another function of VGAM1458 is therefore inhibition of

PANK (Accession NM_138316). Accordingly, utilities of VGAM1458 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PANK. LOC146667 (Accession XM_097044) is another VGAM1458 host target gene. LOC146667 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146667, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146667 BINDING SITE, designated SEQ ID:40710, to the nucleotide sequence of VGAM1458 RNA, herein designated VGAM RNA, also designated SEQ ID:4169.

[50656] Another function of VGAM1458 is therefore inhibition of LOC146667 (Accession XM_097044). Accordingly, utilities of VGAM1458 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146667. LOC147184 (Accession NM_145274) is another VGAM1458 host target gene. LOC147184 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147184, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC147184 BINDING SITE, designated SEQ ID:29786, to the nucleotide sequence of VGAM1458 RNA, herein designated VGAM RNA, also designated SEQ ID:4169.

[50657] Another function of VGAM1458 is therefore inhibition of LOC147184 (Accession NM_145274). Accordingly, utilities of VGAM1458 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147184. LOC149448 (Accession XM_097642) is another VGAM1458 host target gene. LOC149448 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149448, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149448 BINDING SITE, designated SEQ ID:40989, to the nucleotide sequence of VGAM1458 RNA, herein designated VGAM RNA, also designated SEQ ID:4169.

[50658] Another function of VGAM1458 is therefore inhibition of LOC149448 (Accession XM_097642). Accordingly, utilities of VGAM1458 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149448. LOC200531 (Accession XM_114244) is an-

other VGAM1458 host target gene. LOC200531 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC200531, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200531 BINDING SITE, designated SEQ ID:42817, to the nucleotide sequence of VGAM1458 RNA, herein designated VGAM RNA, also designated SEQ ID:4169.

[50659] Another function of VGAM1458 is therefore inhibition of LOC200531 (Accession XM_114244). Accordingly, utilities of VGAM1458 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200531. LOC257443 (Accession XM_171072) is another VGAM1458 host target gene. LOC257443 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257443, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257443 BINDING SITE, designated SEQ ID:45871, to the nucleotide sequence of VGAM1458 RNA, herein designated VGAM RNA, also designated SEQ ID:4169.

[50660] Another function of VGAM1458 is therefore inhibition of LOC257443 (Accession XM_171072). Accordingly, utilities of VGAM1458 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257443. LOC51301 (Accession NM_016591) is another VGAM1458 host target gene. LOC51301 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC51301, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51301 BINDING SITE, designated SEQ ID:18669, to the nucleotide sequence of VGAM1458 RNA, herein designated VGAM RNA, also designated SEQ ID:4169.

[50661] Another function of VGAM1458 is therefore inhibition of LOC51301 (Accession NM_016591). Accordingly, utilities of VGAM1458 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51301. LOC90110 (Accession XM_029046) is another VGAM1458 host target gene. LOC90110 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC90110, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90110 BINDING SITE, designated SEQ ID:30840, to the nucleotide sequence of VGAM1458 RNA, herein designated VGAM RNA, also designated SEQ ID:4169.

[50662] Another function of VGAM1458 is therefore inhibition of LOC90110 (Accession XM_029046). Accordingly, utilities of VGAM1458 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90110. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1459 (VGAM1459) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50663] VGAM1459 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1459 was detected is described hereinabove with reference to Figs. 1-8.

[50664] VGAM1459 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM1459 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[50665] VGAM1459 gene encodes a VGAM1459 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1459 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1459 precursor RNA is designated SEQ ID:1445, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1445 is located at position 39156 relative to the genome of Equine Herpesvirus 2.

[50666] VGAM1459 precursor RNA folds onto itself, forming VGAM1459 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50667] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1459 folded precursor RNA into VGAM1459

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1459 RNA is designated SEQ ID:4170, and is provided hereinbelow with reference to the sequence listing part.

[50668] VGAM1459 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1459 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1459 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[50669] VGAM1459 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1459 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1459 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1459 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1459 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[50670] The complementary binding of VGAM1459 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1459 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1459 host target RNA into VGAM1459 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[50671] It is appreciated that VGAM1459 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1459 host target genes. The mRNA of each one of this plurality of VGAM1459 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1459 RNA, herein designated VGAM RNA, and which when bound by VGAM1459 RNA causes inhibition of translation of respective one or more VGAM1459 host target proteins.

[50672] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1459 gene, herein designated VGAM GENE, on one or more VGAM1459 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[50673] It is yet further appreciated that a function of VGAM1459 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1459 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1459 correlate with, and may be deduced from, the identity of the host target genes which VGAM1459 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50674] Nucleotide sequences of the VGAM1459 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1459 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1459 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1459 are further described hereinbelow with reference to Table 1.

[50675] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1459 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1459 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50676] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1459 gene, herein designated VGAM is inhibition of expression of VGAM1459 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1459 correlate with, and may be deduced from, the identity of the target genes which VGAM1459 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[50677] Cytochrome P450, Subfamily I (aromatic compound-inducible), Polypeptide 1 (CYP1A1, Accession NM_000499) is a VGAM1459 host target gene. CYP1A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CYP1A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYP1A1 BINDING SITE, designated SEQ ID:6111, to the nucleotide

sequence of VGAM1459 RNA, herein designated VGAM RNA, also designated SEQ ID:4170.

[50678] A function of VGAM1459 is therefore inhibition of Cytochrome P450, Subfamily I (aromatic compound-inducible), Polypeptide 1 (CYP1A1, Accession NM_000499), a gene which intervenes in an NADPH-dependent electron transport pathway. Accordingly, utilities of VGAM1459 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP1A1. The function of CYP1A1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM335. Ladinin 1 (LAD1, Accession NM_005558) is another VGAM1459 host target gene. LAD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LAD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LAD1 BINDING SITE, designated SEQ ID:12084, to the nucleotide sequence of VGAM1459 RNA, herein designated VGAM RNA, also designated SEQ ID:4170.

[50679] Another function of VGAM1459 is therefore inhibition of

Ladinin 1 (LAD1, Accession NM_005558). Accordingly, utilities of VGAM1459 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LAD1. Lipase, Hormone-sensitive (LIPE, Accession NM_005357) is another VGAM1459 host target gene. LIPE BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LIPE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LIPE BINDING SITE, designated SEQ ID:11825, to the nucleotide sequence of VGAM1459 RNA, herein designated VGAM RNA, also designated SEQ ID:4170.

[50680] Another function of VGAM1459 is therefore inhibition of Lipase, Hormone-sensitive (LIPE, Accession NM_005357), a gene which primarily hydrolyzes stored triglycerides to free fatty acids. Accordingly, utilities of VGAM1459 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIPE. The function of LIPE has been established by previous studies. Free fatty acids (FFA) derived from adipose tissue triglycerides are the most important fuel in mammals and provide more than half the caloric needs during fasting. Hormone-sensi-

tive lipase (HSL) has a vital role in the mobilization of FFA from adipose tissue by controlling the rate of lipolysis of the stored triglycerides. HSL regulates energy homeostasis by catalyzing the rate-limiting step in adipose tissue lipolysis. Like glycogen phosphorylase (OMIM Ref. No. 232700), the corresponding enzyme in carbohydrate metabolism, HSL is under acute neuronal and hormonal control. In both cases activation by catecholamines occurs through the cyclic AMP-mediated phosphorylation of a single serine residue. The dephosphorylation of HSL by insulin is responsible for the antilipolytic effect of this hormone, one of its most important actions. Holm et al. (1988) cloned the gene for hormone-sensitive lipase from the rat adipocyte and found that the 757-amino acid sequence predicted by the cDNA shows no homology with any other known lipase or protein. The activity-controlling phosphorylation site was localized to serine-563 in a markedly hydrophilic domain, and a lipid-binding consensus site was tentatively identified. They used the rat clone to map the human HSL gene to 19cen-q13.3 by Southern analysis of DNA from human-rodent somatic cell hybrids. By hybridization studies using a panel of somatic cell hybrids with subchromosomal segments of 19q, Schonk et

al. (1990) localized the HSL gene, symbolized LIPE, to 19q13.1. By fluorescence in situ hybridization, Levitt et al. (1995) mapped the LIPE gene to 19q13.1–q13.2 Li et al. (1994) found that the gene encoding mouse Hsl spans approximately 10.4 kb and comprises 9 exons interrupted by 8 introns. The deduced amino acid sequence predicted a protein that shows 94% identity with the previously determined rat sequence and 85% identity with the human sequence. Despite the high degree of similarity, the 3 species diverge significantly for a stretch of 16 amino acid residues upstream of the phosphorylation site. Wang et al. (1994) demonstrated that the homologous gene is on proximal chromosome 7 in the mouse. The mouse locus, symbolized Lipe, was found to be distinct from the Tub and Ad loci, which are associated with obesity in the mouse

[50681] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[50682] Schonk, D.; van Dijk, P.; Riegmann, P.; Trapman, J.; Holm, C.; Willcocks, T. C.; Sillekens, P.; van Venrooij, W.; Wimmer, E.; Geurts van Kessel, A.; Ropers, H.–H.; Wieringa, B. : Assignment of seven genes to distinct intervals on the

midportion of human chromosome 19q surrounding the myotonic dystrophy gene region. Cytogenet. Cell Genet. 54: 15–19, 1990. ; and

[50683] Levitt, R. C.; Liu, Z.; Nouri, N.; Meyers, D. A.; Brandriff, B.; Mohrenweiser, H. M. : Mapping of the gene for hormone sensitive lipase (LIPE) to chromosome 19q13.1–q13.2. Cytogenet. Cell G.

[50684] Further studies establishing the function and utilities of LIPE are found in John Hopkins OMIM database record ID 151750, and in cited publications numbered and 3788–3793 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Supervillin (SVIL, Accession NM_003174) is another VGAM1459 host target gene. SVIL BINDING SITE1 and SVIL BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SVIL, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SVIL BINDING SITE1 and SVIL BINDING SITE2, designated SEQ ID:9149 and SEQ ID:22346 respectively, to the nucleotide sequence of VGAM1459 RNA, herein designated VGAM RNA, also designated SEQ ID:4170.

[50685] Another function of VGAM1459 is therefore inhibition of Supervillin (SVIL, Accession NM_003174), a gene which binds actin, links filamentous actin with the plasma membrane; and contains putative nuclear localization signals. Accordingly, utilities of VGAM1459 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SVIL. The function of SVIL has been established by previous studies. Pope et al. (1998) used PCR with primers based on bovine sequence to clone human supervillin. The human gene encodes a 1,788-amino acid polypeptide that contains 3 predicted nuclear localization signals, several consensus phosphorylation sites, 1 ATP/GTP-binding motif, 1 potential RNP-binding site, and 3 potential actin-binding sites. The region containing the actin-binding sites is similar to the 'headpiece' of villin (OMIM Ref. No. 193040). Dot blots showed that many tissues express supervillin, with the highest expression in muscle tissues. Northern blot analysis revealed a 7.5-kb mRNA that is abundant in some human cancer cell lines. Southern blot analysis revealed that supervillin is a single-copy gene. Activation of androgen receptor (AR; 313700) via androgen in muscle cells is closely linked to their growth and differentiation. Ting et al. (2002) cloned and

characterized supervillin as an AR coregulator from a skeletal muscle cDNA library. They identified a domain within supervillin (amino acids 594 to 1,268) that could interact with the AR N terminus and DNA-binding domain–ligand-binding domain in a ligand-enhanced manner. Subcellular colocalization studies with fluorescence staining indicated that supervillin colocalized with AR in the presence of 5- α -dihydrotestosterone in COS-1 cells. Furthermore, supervillin could enhance expression of the endogenous AR target gene p27(KIP1) (OMIM Ref. No. 600778) in prostate cells. Thus, supervillin is an AR coregulator that can enhance AR transactivation in muscle and other cells.

[50686] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[50687] Pope, R. K.; Pestonjamas, K. N.; Smith, K. P.; Wulfkühle, J. D.; Strassel, C. P.; Lawrence, J. B.; Luna, E. J. : Cloning, characterization, and chromosomal localization of human supervillin (SVIL). *Genomics* 52: 342–351, 1998. ; and

[50688] Ting, H.-J.; Yeh, S.; Nishimura, K.; Chang, C. : Supervillin associates with androgen receptor and modulates its transcriptional activity. *Proc. Nat. Acad. Sci.* 99: 661–666,

2002.

[50689] Further studies establishing the function and utilities of SVIL are found in John Hopkins OMIM database record ID 604126, and in cited publications numbered 7410–7411 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Nudix (nucleoside diphosphate linked moiety X)–type Motif 11 (NUDT11, Accession XM_010230) is another VGAM1459 host target gene. NUDT11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NUDT11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NUDT11 BINDING SITE, designated SEQ ID:30136, to the nucleotide sequence of VGAM1459 RNA, herein designated VGAM RNA, also designated SEQ ID:4170.

[50690] Another function of VGAM1459 is therefore inhibition of Nudix (nucleoside diphosphate linked moiety X)–type Motif 11 (NUDT11, Accession XM_010230). Accordingly, utilities of VGAM1459 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NUDT11. Pleiomorphic Adenoma Gene–like 2

(PLAGL2, Accession XM_047007) is another VGAM1459 host target gene. PLAGL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PLAGL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLAGL2 BINDING SITE, designated SEQ ID:34873, to the nucleotide sequence of VGAM1459 RNA, herein designated VGAM RNA, also designated SEQ ID:4170.

[50691] Another function of VGAM1459 is therefore inhibition of Pleiomorphic Adenoma Gene-like 2 (PLAGL2, Accession XM_047007). Accordingly, utilities of VGAM1459 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLAGL2. PRO2958 (Accession NM_018546) is another VGAM1459 host target gene. PRO2958 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRO2958, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2958 BINDING SITE, designated SEQ ID:20625, to the nucleotide sequence of VGAM1459

RNA, herein designated VGAM RNA, also designated SEQ ID:4170.

[50692] Another function of VGAM1459 is therefore inhibition of PRO2958 (Accession NM_018546). Accordingly, utilities of VGAM1459 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2958. LOC154790 (Accession XM_088044) is another VGAM1459 host target gene. LOC154790 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC154790, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154790 BINDING SITE, designated SEQ ID:39489, to the nucleotide sequence of VGAM1459 RNA, herein designated VGAM RNA, also designated SEQ ID:4170.

[50693] Another function of VGAM1459 is therefore inhibition of LOC154790 (Accession XM_088044). Accordingly, utilities of VGAM1459 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154790. LOC203197 (Accession XM_114645) is another VGAM1459 host target gene. LOC203197 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by LOC203197, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203197 BINDING SITE, designated SEQ ID:43008, to the nucleotide sequence of VGAM1459 RNA, herein designated VGAM RNA, also designated SEQ ID:4170.

[50694] Another function of VGAM1459 is therefore inhibition of LOC203197 (Accession XM_114645). Accordingly, utilities of VGAM1459 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203197. LOC254249 (Accession XM_170931) is another VGAM1459 host target gene. LOC254249 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254249, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254249 BINDING SITE, designated SEQ ID:45711, to the nucleotide sequence of VGAM1459 RNA, herein designated VGAM RNA, also designated SEQ ID:4170.

[50695] Another function of VGAM1459 is therefore inhibition of LOC254249 (Accession XM_170931). Accordingly, utilities

of VGAM1459 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254249. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1460 (VGAM1460) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50696] VGAM1460 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1460 was detected is described hereinabove with reference to Figs. 1-8.

[50697] VGAM1460 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM1460 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50698] VGAM1460 gene encodes a VGAM1460 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1460 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM1460 precursor RNA is designated SEQ ID:1446, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1446 is located at position 39460 relative to the genome of Equine Herpesvirus 2.

[50699] VGAM1460 precursor RNA folds onto itself, forming VGAM1460 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50700] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1460 folded precursor RNA into VGAM1460 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide sequence of VGAM1460 RNA is designated SEQ ID:4171, and

is provided hereinbelow with reference to the sequence listing part.

[50701] VGAM1460 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1460 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1460 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[50702] VGAM1460 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1460 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1460 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM1460 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1460 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[50703] The complementary binding of VGAM1460 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1460 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1460 host target RNA into VGAM1460 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50704] It is appreciated that VGAM1460 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1460 host target genes. The mRNA of each one of this plurality of VGAM1460 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM1460 RNA, herein designated VGAM RNA, and which when bound by VGAM1460 RNA causes inhibition of translation of respective one or more VGAM1460 host target proteins.

[50705] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1460 gene, herein designated VGAM GENE, on one or more VGAM1460 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[50706] It is yet further appreciated that a function of VGAM1460 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1460 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1460 correlate with, and may be deduced from, the identity of the host target genes which VGAM1460 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50707] Nucleotide sequences of the VGAM1460 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1460 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1460 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1460 are further described hereinbelow with reference to Table 1.

[50708] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1460 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1460 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50709] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM1460 gene, herein designated VGAM is inhibition of expression of VGAM1460 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1460 correlate with, and may be deduced from, the identity of the target genes which VGAM1460 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[50710] KIAA0237 (Accession NM_014747) is a VGAM1460 host target gene. KIAA0237 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0237, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0237 BINDING SITE, designated SEQ ID:16441, to the nucleotide sequence of VGAM1460 RNA, herein designated VGAM RNA, also designated SEQ ID:4171.

[50711] A function of VGAM1460 is therefore inhibition of KIAA0237 (Accession NM_014747). Accordingly, utilities of VGAM1460 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0237. KIAA0453 (Accession XM_044546) is another VGAM1460 host target gene. KIAA0453 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0453, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0453 BINDING SITE, designated SEQ ID:34229, to the nucleotide sequence of VGAM1460 RNA, herein designated VGAM RNA, also designated SEQ ID:4171.

[50712] Another function of VGAM1460 is therefore inhibition of KIAA0453 (Accession XM_044546). Accordingly, utilities of VGAM1460 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0453. MGC10812 (Accession NM_031425) is another VGAM1460 host target gene. MGC10812 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC10812, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC10812 BINDING SITE, designated SEQ ID:25411, to the nucleotide sequence of VGAM1460 RNA, herein designated VGAM RNA, also designated SEQ ID:4171.

[50713] Another function of VGAM1460 is therefore inhibition of

MGC10812 (Accession NM_031425). Accordingly, utilities of VGAM1460 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10812. LOC219397 (Accession XM_167889) is another VGAM1460 host target gene. LOC219397 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219397, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219397 BINDING SITE, designated SEQ ID:44899, to the nucleotide sequence of VGAM1460 RNA, herein designated VGAM RNA, also designated SEQ ID:4171.

[50714] Another function of VGAM1460 is therefore inhibition of LOC219397 (Accession XM_167889). Accordingly, utilities of VGAM1460 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219397. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1461 (VGAM1461) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[50715] VGAM1461 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1461 was detected is described hereinabove with reference to Figs. 1–8.

[50716] VGAM1461 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM1461 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50717] VGAM1461 gene encodes a VGAM1461 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1461 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1461 precursor RNA is designated SEQ ID:1447, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1447 is located at position 44627 relative to the genome of Equine Herpesvirus 2.

[50718] VGAM1461 precursor RNA folds onto itself, forming VGAM1461 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two–

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50719] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1461 folded precursor RNA into VGAM1461 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1461 RNA is designated SEQ ID:4172, and is provided hereinbelow with reference to the sequence listing part.

[50720] VGAM1461 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1461 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1461 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[50721] VGAM1461 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1461 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1461 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1461 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1461 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[50722] The complementary binding of VGAM1461 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1461 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1461 host target RNA into VGAM1461 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50723] It is appreciated that VGAM1461 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1461 host target genes. The mRNA of each one of this plurality of VGAM1461 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1461 RNA, herein designated VGAM RNA, and which when bound by VGAM1461 RNA causes inhibition of translation of respective one or more VGAM1461 host target proteins.

[50724] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1461 gene, herein designated VGAM GENE, on one

or more VGAM1461 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[50725] It is yet further appreciated that a function of VGAM1461 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1461 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1461 correlate with, and may be deduced from, the identity of the host target genes which VGAM1461 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50726] Nucleotide sequences of the VGAM1461 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1461 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1461 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1461 are further described hereinbelow with reference to Table 1.

[50727] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1461 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1461 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50728] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1461 gene, herein designated VGAM is inhibition of expression of VGAM1461 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1461 correlate with, and may be deduced from, the identity of the target genes which VGAM1461 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[50729] Membrane-spanning 4-domains, Subfamily A, Member 3

(hematopoietic cell-specific) (MS4A3, Accession NM_006138) is a VGAM1461 host target gene. MS4A3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MS4A3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MS4A3 BINDING SITE, designated SEQ ID:12777, to the nucleotide sequence of VGAM1461 RNA, herein designated VGAM RNA, also designated SEQ ID:4172.

[50730] A function of VGAM1461 is therefore inhibition of Membrane-spanning 4-domains, Subfamily A, Member 3 (hematopoietic cell-specific) (MS4A3, Accession NM_006138). Accordingly, utilities of VGAM1461 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MS4A3. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1462 (VGAM1462) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50731] VGAM1462 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1462 was detected is described hereinabove with reference to Figs. 1–8.

[50732] VGAM1462 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM1462 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50733] VGAM1462 gene encodes a VGAM1462 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1462 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1462 precursor RNA is designated SEQ ID:1448, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1448 is located at position 40327 relative to the genome of Equine Herpesvirus 2.

[50734] VGAM1462 precursor RNA folds onto itself, forming VGAM1462 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50735] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1462 folded precursor RNA into VGAM1462 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1462 RNA is designated SEQ ID:4173, and is provided hereinbelow with reference to the sequence listing part.

[50736] VGAM1462 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1462 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1462 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[50737] VGAM1462 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1462 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1462 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1462 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1462 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[50738] The complementary binding of VGAM1462 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1462 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1462 host target RNA into VGAM1462 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50739] It is appreciated that VGAM1462 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1462 host target genes. The mRNA of each one of this plurality of VGAM1462 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1462 RNA, herein designated VGAM RNA, and which when bound by VGAM1462 RNA causes inhibition of translation of respective one or more VGAM1462 host target proteins.

[50740] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1462 gene, herein designated VGAM GENE, on one or more VGAM1462 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[50741] It is yet further appreciated that a function of VGAM1462 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1462 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1462 correlate with, and may be deduced from, the identity of the host target genes which VGAM1462 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50742] Nucleotide sequences of the VGAM1462 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM1462 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1462 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1462 are further described hereinbelow with reference to Table 1.

[50743] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1462 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1462 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50744] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1462 gene, herein designated VGAM is inhibition of expression of VGAM1462 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1462 correlate with, and may be deduced from, the identity of the target genes which VGAM1462 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[50745] Phosphodiesterase 4D, CAMP-specific (phosphodiesterase E3 dunce homolog, Drosophila) (PDE4D, Accession XM_056815) is a VGAM1462 host target gene. PDE4D

BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PDE4D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDE4D BINDING SITE, designated SEQ ID:36437, to the nucleotide sequence of VGAM1462 RNA, herein designated VGAM RNA, also designated SEQ ID:4173.

[50746] A function of VGAM1462 is therefore inhibition of Phosphodiesterase 4D, CAMP-specific (phosphodiesterase E3 dunce homolog, *Drosophila*) (PDE4D, Accession XM_056815), a gene which has similarity to *Drosophila* dnc, which is the affected protein in learning and memory mutant dunce. Accordingly, utilities of VGAM1462 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE4D. The function of PDE4D and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM180. Protein Phosphatase 1, Regulatory (inhibitor) Subunit 8 (PPP1R8, Accession NM_138558) is another VGAM1462 host target gene. PPP1R8 BINDING SITE1 through PPP1R8 BINDING SITE3 are HOST TARGET binding

sites found in untranslated regions of mRNA encoded by PPP1R8, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R8 BINDING SITE1 through PPP1R8 BINDING SITE3, designated SEQ ID:28855, SEQ ID:8569 and SEQ ID:15339 respectively, to the nucleotide sequence of VGAM1462 RNA, herein designated VGAM RNA, also designated SEQ ID:4173.

[50747] Another function of VGAM1462 is therefore inhibition of Protein Phosphatase 1, Regulatory (inhibitor) Subunit 8 (PPP1R8, Accession NM_138558), a gene which is an inhibitor subunit of the major nuclear protein phosphatase-1 (pp-1). Accordingly, utilities of VGAM1462 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R8. The function of PPP1R8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM101.KIAA0603 (Accession NM_014832) is another VGAM1462 host target gene. KIAA0603 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0603, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0603 BINDING SITE, designated SEQ ID:16828, to the nucleotide sequence of VGAM1462 RNA, herein designated VGAM RNA, also designated SEQ ID:4173.

[50748] Another function of VGAM1462 is therefore inhibition of KIAA0603 (Accession NM_014832). Accordingly, utilities of VGAM1462 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0603. MEGF10 (Accession NM_032446) is another VGAM1462 host target gene. MEGF10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MEGF10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MEGF10 BINDING SITE, designated SEQ ID:26208, to the nucleotide sequence of VGAM1462 RNA, herein designated VGAM RNA, also designated SEQ ID:4173.

[50749] Another function of VGAM1462 is therefore inhibition of MEGF10 (Accession NM_032446). Accordingly, utilities of VGAM1462 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with MEGF10. MGC13008 (Accession NM_032686) is another VGAM1462 host target gene. MGC13008 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC13008, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC13008 BINDING SITE, designated SEQ ID:26406, to the nucleotide sequence of VGAM1462 RNA, herein designated VGAM RNA, also designated SEQ ID:4173.

[50750] Another function of VGAM1462 is therefore inhibition of MGC13008 (Accession NM_032686). Accordingly, utilities of VGAM1462 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13008. MGC14156 (Accession NM_032906) is another VGAM1462 host target gene. MGC14156 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC14156, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC14156 BINDING SITE, designated SEQ ID:26727, to

the nucleotide sequence of VGAM1462 RNA, herein designated VGAM RNA, also designated SEQ ID:4173.

[50751] Another function of VGAM1462 is therefore inhibition of MGC14156 (Accession NM_032906). Accordingly, utilities of VGAM1462 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC14156. Protocadherin 10 (PCDH10, Accession NM_032961) is another VGAM1462 host target gene. PCDH10 BINDING SITE1 and PCDH10 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PCDH10, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDH10 BINDING SITE1 and PCDH10 BINDING SITE2, designated SEQ ID:26768 and SEQ ID:21883 respectively, to the nucleotide sequence of VGAM1462 RNA, herein designated VGAM RNA, also designated SEQ ID:4173.

[50752] Another function of VGAM1462 is therefore inhibition of Protocadherin 10 (PCDH10, Accession NM_032961). Accordingly, utilities of VGAM1462 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH10. LOC142893 (Accession

XM_096354) is another VGAM1462 host target gene.

LOC142893 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC142893, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC142893 BINDING SITE, designated SEQ ID:40321, to the nucleotide sequence of VGAM1462 RNA, herein designated VGAM RNA, also designated SEQ ID:4173.

[50753] Another function of VGAM1462 is therefore inhibition of LOC142893 (Accession XM_096354). Accordingly, utilities of VGAM1462 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC142893. LOC148545 (Accession XM_086226) is another VGAM1462 host target gene. LOC148545 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148545, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148545 BINDING SITE, designated SEQ ID:38554, to the nucleotide sequence of VGAM1462 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4173.

[50754] Another function of VGAM1462 is therefore inhibition of LOC148545 (Accession XM_086226). Accordingly, utilities of VGAM1462 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148545. LOC150170 (Accession XM_086799) is another VGAM1462 host target gene. LOC150170 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150170, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150170 BINDING SITE, designated SEQ ID:38862, to the nucleotide sequence of VGAM1462 RNA, herein designated VGAM RNA, also designated SEQ ID:4173.

[50755] Another function of VGAM1462 is therefore inhibition of LOC150170 (Accession XM_086799). Accordingly, utilities of VGAM1462 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150170. LOC150175 (Accession XM_086806) is another VGAM1462 host target gene. LOC150175 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150175, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150175 BINDING SITE, designated SEQ ID:38884, to the nucleotide sequence of VGAM1462 RNA, herein designated VGAM RNA, also designated SEQ ID:4173.

[50756] Another function of VGAM1462 is therefore inhibition of LOC150175 (Accession XM_086806). Accordingly, utilities of VGAM1462 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150175. LOC150215 (Accession XM_086813) is another VGAM1462 host target gene. LOC150215 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150215, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150215 BINDING SITE, designated SEQ ID:38888, to the nucleotide sequence of VGAM1462 RNA, herein designated VGAM RNA, also designated SEQ ID:4173.

[50757] Another function of VGAM1462 is therefore inhibition of LOC150215 (Accession XM_086813). Accordingly, utilities of VGAM1462 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC150215. LOC150218 (Accession XM_086850) is another VGAM1462 host target gene. LOC150218 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150218, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150218 BINDING SITE, designated SEQ ID:38915, to the nucleotide sequence of VGAM1462 RNA, herein designated VGAM RNA, also designated SEQ ID:4173.

[50758] Another function of VGAM1462 is therefore inhibition of LOC150218 (Accession XM_086850). Accordingly, utilities of VGAM1462 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150218. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1463 (VGAM1463) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50759] VGAM1463 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1463 was detected is described hereinabove with reference to Figs. 1–8.

[50760] VGAM1463 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM1463 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50761] VGAM1463 gene encodes a VGAM1463 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1463 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1463 precursor RNA is designated SEQ ID:1449, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1449 is located at position 38131 relative to the genome of Equine Herpesvirus 2.

[50762] VGAM1463 precursor RNA folds onto itself, forming VGAM1463 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50763] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1463 folded precursor RNA into VGAM1463 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1463 RNA is designated SEQ ID:4174, and is provided hereinbelow with reference to the sequence listing part.

[50764] VGAM1463 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1463 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1463 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[50765] VGAM1463 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1463 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1463 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1463 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1463 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[50766] The complementary binding of VGAM1463 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1463 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1463 host target RNA into VGAM1463 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50767] It is appreciated that VGAM1463 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1463 host target genes. The mRNA of each one of this plurality of VGAM1463 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1463 RNA, herein designated VGAM RNA, and which when bound by VGAM1463 RNA causes inhibition of translation of respective one or more VGAM1463 host target proteins.

[50768] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1463 gene, herein designated VGAM GENE, on one or more VGAM1463 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[50769] It is yet further appreciated that a function of VGAM1463 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1463 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1463 correlate with, and may be deduced from, the identity of the host target genes which VGAM1463 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50770] Nucleotide sequences of the VGAM1463 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM1463 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1463 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1463 are further described hereinbelow with reference to Table 1.

[50771] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1463 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1463 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50772] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1463 gene, herein designated VGAM is inhibition of expression of VGAM1463 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1463 correlate with, and may be deduced from, the identity of the target genes which VGAM1463 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[50773] Death Associated Transcription Factor 1 (DATF1, Accession NM_022105) is a VGAM1463 host target gene. DATF1 BINDING SITE1 and DATF1 BINDING SITE2 are HOST TAR-

GET binding sites found in untranslated regions of mRNA encoded by DATF1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DATF1 BINDING SITE1 and DATF1 BINDING SITE2, designated SEQ ID:22650 and SEQ ID:28061 respectively, to the nucleotide sequence of VGAM1463 RNA, herein designated VGAM RNA, also designated SEQ ID:4174.

[50774] A function of VGAM1463 is therefore inhibition of Death Associated Transcription Factor 1 (DATF1, Accession NM_022105). Accordingly, utilities of VGAM1463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DATF1. KIAA0014 (Accession NM_014665) is another VGAM1463 host target gene. KIAA0014 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0014, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0014 BINDING SITE, designated SEQ ID:16112, to the nucleotide sequence of VGAM1463 RNA, herein designated VGAM RNA, also designated SEQ

ID:4174.

[50775] Another function of VGAM1463 is therefore inhibition of KIAA0014 (Accession NM_014665). Accordingly, utilities of VGAM1463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0014. LOC158156 (Accession XM_088496) is another VGAM1463 host target gene. LOC158156 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158156, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158156 BINDING SITE, designated SEQ ID:39736, to the nucleotide sequence of VGAM1463 RNA, herein designated VGAM RNA, also designated SEQ ID:4174.

[50776] Another function of VGAM1463 is therefore inhibition of LOC158156 (Accession XM_088496). Accordingly, utilities of VGAM1463 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158156. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1464 (VGAM1464) viral gene, which

modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50777] VGAM1464 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1464 was detected is described hereinabove with reference to Figs. 1–8.

[50778] VGAM1464 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM1464 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50779] VGAM1464 gene encodes a VGAM1464 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1464 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1464 precursor RNA is designated SEQ ID:1450, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1450 is located at position 42592 relative to the genome of Equine Herpesvirus 2.

[50780] VGAM1464 precursor RNA folds onto itself, forming

VGAM1464 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50781] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1464 folded precursor RNA into VGAM1464 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide sequence of VGAM1464 RNA is designated SEQ ID:4175, and is provided hereinbelow with reference to the sequence listing part.

[50782] VGAM1464 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1464 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1464 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[50783] VGAM1464 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1464 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1464 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1464 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1464 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[50784] The complementary binding of VGAM1464 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1464 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1464 host target RNA into VGAM1464 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50785] It is appreciated that VGAM1464 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1464 host target genes. The mRNA of each one of this plurality of VGAM1464 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1464 RNA, herein designated VGAM RNA, and which when bound by VGAM1464 RNA causes inhibition of translation of respective one or more VGAM1464 host target proteins.

[50786] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1464 gene, herein designated VGAM GENE, on one or more VGAM1464 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[50787] It is yet further appreciated that a function of VGAM1464 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1464 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1464 correlate with, and may be deduced from, the identity of the host target genes which VGAM1464 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[50788] Nucleotide sequences of the VGAM1464 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1464 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1464 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1464 are further described hereinbelow with reference to Table 1.

[50789] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1464 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1464 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50790] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1464 gene, herein designated VGAM is inhibition of expression of VGAM1464 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1464 correlate with, and may be deduced from, the identity of the target genes which VGAM1464 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[50791] Citron (rho-interacting, serine/threonine kinase 21) (CIT, Accession XM_045786) is a VGAM1464 host target gene. CIT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CIT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CIT BINDING SITE, designated SEQ ID:34566, to the nucleotide sequence of VGAM1464 RNA, herein designated VGAM RNA, also designated SEQ ID:4175.

[50792] A function of VGAM1464 is therefore inhibition of Citron (rho-interacting, serine/threonine kinase 21) (CIT, Accession XM_045786), a gene which is increased several-fold by coexpression of constitutively active Rho . Accordingly, utilities of VGAM1464 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CIT. The function of CIT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM393. Death Effector Domain Containing (DEDD, Accession NM_032998) is another VGAM1464 host target gene. DEDD BINDING SITE is HOST TARGET binding

site found in the 3` untranslated region of mRNA encoded by DEDD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DEDD BINDING SITE, designated SEQ ID:26880, to the nucleotide sequence of VGAM1464 RNA, herein designated VGAM RNA, also designated SEQ ID:4175.

[50793] Another function of VGAM1464 is therefore inhibition of Death Effector Domain Containing (DEDD, Accession NM_032998), a gene which intervenes in apoptosis. Accordingly, utilities of VGAM1464 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DEDD. The function of DEDD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1189. Nuclear Mitotic Apparatus Protein 1 (NUMA1, Accession XM_167853) is another VGAM1464 host target gene. NUMA1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NUMA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of NUMA1 BINDING SITE, designated SEQ ID:44882, to the nucleotide sequence of VGAM1464 RNA, herein designated VGAM RNA, also designated SEQ ID:4175.

[50794] Another function of VGAM1464 is therefore inhibition of Nuclear Mitotic Apparatus Protein 1 (NUMA1, Accession XM_167853), a gene which is nuclear mitotic apparatus protein. Accordingly, utilities of VGAM1464 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NUMA1. The function of NUMA1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM192.FLJ10916 (Accession NM_018271) is another VGAM1464 host target gene. FLJ10916 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ10916, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10916 BINDING SITE, designated SEQ ID:20249, to the nucleotide sequence of VGAM1464 RNA, herein designated VGAM RNA, also designated SEQ ID:4175.

[50795] Another function of VGAM1464 is therefore inhibition of FLJ10916 (Accession NM_018271). Accordingly, utilities of VGAM1464 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10916. FLJ20584 (Accession NM_017891) is another VGAM1464 host target gene. FLJ20584 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20584, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20584 BINDING SITE, designated SEQ ID:19559, to the nucleotide sequence of VGAM1464 RNA, herein designated VGAM RNA, also designated SEQ ID:4175.

[50796] Another function of VGAM1464 is therefore inhibition of FLJ20584 (Accession NM_017891). Accordingly, utilities of VGAM1464 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20584. KIAA1508 (Accession XM_030209) is another VGAM1464 host target gene. KIAA1508 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1508, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1508 BINDING SITE, designated SEQ ID:30995, to the nucleotide sequence of VGAM1464 RNA, herein designated VGAM RNA, also designated SEQ ID:4175.

[50797] Another function of VGAM1464 is therefore inhibition of KIAA1508 (Accession XM_030209). Accordingly, utilities of VGAM1464 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1508. MGC2705 (Accession NM_032701) is another VGAM1464 host target gene. MGC2705 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC2705, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2705 BINDING SITE, designated SEQ ID:26414, to the nucleotide sequence of VGAM1464 RNA, herein designated VGAM RNA, also designated SEQ ID:4175.

[50798] Another function of VGAM1464 is therefore inhibition of MGC2705 (Accession NM_032701). Accordingly, utilities of VGAM1464 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

MGC2705. Placenta-specific 3 (PLAC3, Accession XM_045115) is another VGAM1464 host target gene. PLAC3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PLAC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLAC3 BINDING SITE, designated SEQ ID:34364, to the nucleotide sequence of VGAM1464 RNA, herein designated VGAM RNA, also designated SEQ ID:4175.

[50799] Another function of VGAM1464 is therefore inhibition of Placenta-specific 3 (PLAC3, Accession XM_045115). Accordingly, utilities of VGAM1464 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLAC3. LOC149837 (Accession XM_097747) is another VGAM1464 host target gene. LOC149837 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149837, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149837 BINDING SITE, desig-

nated SEQ ID:41098, to the nucleotide sequence of VGAM1464 RNA, herein designated VGAM RNA, also designated SEQ ID:4175.

[50800] Another function of VGAM1464 is therefore inhibition of LOC149837 (Accession XM_097747). Accordingly, utilities of VGAM1464 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149837. LOC51292 (Accession NM_016576) is another VGAM1464 host target gene. LOC51292 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC51292, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51292 BINDING SITE, designated SEQ ID:18652, to the nucleotide sequence of VGAM1464 RNA, herein designated VGAM RNA, also designated SEQ ID:4175.

[50801] Another function of VGAM1464 is therefore inhibition of LOC51292 (Accession NM_016576). Accordingly, utilities of VGAM1464 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51292. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 1465 (VGAM1465) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50802] VGAM1465 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1465 was detected is described hereinabove with reference to Figs. 1–8.

[50803] VGAM1465 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM1465 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50804] VGAM1465 gene encodes a VGAM1465 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1465 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1465 precursor RNA is designated SEQ ID:1451, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1451 is located at position 40669 relative to the

genome of Equine Herpesvirus 2.

[50805] VGAM1465 precursor RNA folds onto itself, forming VGAM1465 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50806] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1465 folded precursor RNA into VGAM1465 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1465 RNA is designated SEQ ID:4176, and is provided hereinbelow with reference to the sequence listing part.

[50807] VGAM1465 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1465 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1465 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[50808] VGAM1465 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1465 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1465 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1465 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1465 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[50809] The complementary binding of VGAM1465 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1465 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1465 host target RNA into VGAM1465 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50810] It is appreciated that VGAM1465 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1465 host target genes. The mRNA of each one of this plurality of VGAM1465 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1465 RNA, herein designated VGAM RNA, and which when bound by VGAM1465 RNA causes inhibition of translation of respective one or more VGAM1465 host target proteins.

[50811] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1465 gene, herein designated VGAM GENE, on one or more VGAM1465 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[50812] It is yet further appreciated that a function of VGAM1465 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1465 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1465

correlate with, and may be deduced from, the identity of the host target genes which VGAM1465 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50813] Nucleotide sequences of the VGAM1465 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1465 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1465 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1465 are further described hereinbelow with reference to Table 1.

[50814] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1465 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1465 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50815] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1465 gene, herein designated VGAM is inhibition of expression of VGAM1465 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1465 correlate with, and may be deduced

from, the identity of the target genes which VGAM1465 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[50816] Early Growth Response 2 (Krox-20 homolog, Drosophila) (EGR2, Accession NM_000399) is a VGAM1465 host target gene. EGR2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EGR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGR2 BINDING SITE, designated SEQ ID:5973, to the nucleotide sequence of VGAM1465 RNA, herein designated VGAM RNA, also designated SEQ ID:4176.

[50817] A function of VGAM1465 is therefore inhibition of Early Growth Response 2 (Krox-20 homolog, Drosophila) (EGR2, Accession NM_000399), a gene which binds to two specific dna sites located in the promoter region of hox-1.4. Accordingly, utilities of VGAM1465 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGR2. The function of EGR2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM234. Inhibin, Beta B

(activin AB beta polypeptide) (INHBB, Accession NM_002193) is another VGAM1465 host target gene. INHBB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by INHBB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of INHBB BINDING SITE, designated SEQ ID:7948, to the nucleotide sequence of VGAM1465 RNA, herein designated VGAM RNA, also designated SEQ ID:4176.

[50818] Another function of VGAM1465 is therefore inhibition of Inhibin, Beta B (activin AB beta polypeptide) (INHBB, Accession NM_002193), a gene which inhibits inhibit the secretion of follitropin by the pituitary gland. Accordingly, utilities of VGAM1465 include diagnosis, prevention and treatment of diseases and clinical conditions associated with INHBB. The function of INHBB has been established by previous studies. The activins, dimers of beta-A or beta-B subunits encoded by the genes *Inhba* (OMIM Ref. No. 147290) and *Inhbb*, respectively, are TGF-beta (see OMIM Ref. No. 190180) superfamily members that have roles in reproduction and development (Brown et al., 2000). Activin ligands act as growth and differentiation

factors in many cells and tissues. Mellor et al. (2000) examined the localization of and dimerization among activin subunits. The results demonstrated that activin beta-C (see OMIM Ref. No. 601233) can form dimers with activin beta-A and beta-B in vitro, but not with the inhibin alpha subunit (OMIM Ref. No. 147380). Using a specific antibody, activin beta-C protein was localized to human liver and prostate and colocalized with beta-A and beta-B subunits to specific cell types in benign and malignant prostate tissues. The capacity to form novel activin heterodimers (but not inhibin C) appears to reside in the human liver and prostate. The authors concluded that formation of activin AC or BC heterodimers may have significant implications in the regulation of levels and/or biologic activity of other activins in these tissues. Malignancy of pheochromocytomas is difficult to estimate on the basis of histopathologic features. In a search for new markers to differentiate malignant pheochromocytomas from benign ones, Salmenkivi et al. (2001) tested the value of inhibin/activin subunit expression. Inhibins are heterodimeric glycoproteins consisting of an alpha subunit and either a beta-A or a beta-B subunit. Activins are composed of beta subunits only. Immunohistochemically, in-

hibin/activin beta-B subunit was strongly positive in the normal adrenal medulla, but the cortex was negative. A striking difference was found in inhibin/activin beta-B expression between benign and malignant pheochromocytomas. The majority of benign adrenal tumors (27 of 30) showed strong or moderate immunoreactivity, whereas all 7 malignant tumors were negative or only weakly positive for inhibin/activin beta-B subunit. Salmenkivi et al. (2001) suggested that inhibin/activin beta-B subunit is expressed in normal adrenal medullary cells. Strong staining was found in most benign adrenal pheochromocytomas, whereas malignant tumors were almost negative. They concluded that loss of inhibin/activin beta-B subunit expression in pheochromocytomas may be used as an indicator of malignant potential. Animal model experiments lend further support to the function of INHBB. Whereas mice homozygous for the *Inhba*-null allele demonstrate disruption of whisker, palate, and tooth development leading to neonatal lethality, homozygous *Inhbb*-null mice are viable, fertile, and have eye defects. To determine if these phenotypes were due to spatiotemporal expression differences of the ligands or disruption of specific ligand-receptor interactions, Brown et al. (2000) replaced the re-

gion of *Inhba* encoding the mature protein with *Inhbb*, creating the allele designated *Inhba*(BK). Although the craniofacial phenotypes of the *Inhba*-null mutation were rescued by the *Inhba*(BK) allele, somatic, testicular, genital, and hair growth were grossly affected and influenced by the dosage and bioactivity of the allele. Thus, Brown et al. (2000) concluded that functional compensation within the TGF- β superfamily can occur if the replacement gene is expressed appropriately. The novel phenotypes in these mice further illustrate the usefulness of insertion strategies for defining protein function. The structural organization of the testes of adult *Inhba*(BK/BK) mice was normal; however, the differentiation of the seminiferous tubules of *Inhba*(BK/-) mice was delayed. The testicular volumes of both *Inhba*(BK/BK) and *Inhba*(BK/-) mice were less than those of controls, and the dosage of the *Inhba*(BK) allele correlated positively with testicular size. *Inhba*(+/BK) males had normal onset of fertility, whereas *Inhba*(BK/BK) males had delayed onset of fertility similar to *Acvr2* (OMIM Ref. No. 102581) -/- mice. Only 1 in 6 *Inhba*(BK/BK) females produced litters, whereas *Inhba*(+/BK) females were normally fertile. The ovaries of *Inhba*(BK/-) mice were smaller and contained fewer large preantral

follicles than those of controls. Inhba(BK/BK) and Inhba(BK/–) mice were identified by their smaller size, slower hair growth, the rough appearance of their fur, and sunken eyes. Approximately 50% of Inhba(BK/BK) mice died by 26 weeks, whereas Inhba(BK/–) mice invariably became cachectic and died between 3 and 4 weeks. The summary of phenotypic findings of Inhba(BK/–) mice includes short whiskers, normal tooth development, no cleft palate, symmetric growth deficiency (OMIM Ref. No. severe), enlargement of external genitalia, hypogonadism (OMIM Ref. No. severe), delayed hair growth (moderate), hypoglycemia (mild), decreased life expectancy (OMIM Ref. No. severe), and anemia

[50819] It is appreciated that the abovementioned animal model for INHBB is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[50820] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[50821] Salmenkivi, K.; Arola, J.; Voutilainen, R.; Ilvesmaki, V.; Haglund, C.; Kahri, A. I.; Heikkila, P.; Liu, J. : Inhibin/activin beta-B-subunit expression in pheochromocytomas

favours benign diagnosis. J. Clin. Endocr. Metab. 86: 2231–2235, 2001. ; and

[50822] Brown, C. W.; Houston–Hawkins, D. E.; Woodruff, T. K.; Matzuk, M. M. : Insertion of Inhbb into the Inhba locus rescues the Inhba–null phenotype and reveals new activin functions. Nature.

[50823] Further studies establishing the function and utilities of INHBB are found in John Hopkins OMIM database record ID 147390, and in cited publications numbered 5241, 11328–524 and 11329–11330 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Paired Basic Amino Acid Cleaving System 4 (PACE4, Accession NM_002570) is another VGAM1465 host target gene. PACE4 BINDING SITE1 and PACE4 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PACE4, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PACE4 BINDING SITE1 and PACE4 BINDING SITE2, designated SEQ ID:8432 and SEQ ID:28721 respectively, to the nucleotide sequence of VGAM1465 RNA, herein designated VGAM RNA, also designated SEQ ID:4176.

[50824] Another function of VGAM1465 is therefore inhibition of Paired Basic Amino Acid Cleaving System 4 (PACE4, Accession NM_002570), a gene which processes hormone precursors by cleaving paired basic amino acids. Accordingly, utilities of VGAM1465 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PACE4. The function of PACE4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1194. Potassium Voltage-gated Channel, Delayed-rectifier, Subfamily S, Member 1 (KCNS1, Accession NM_002251) is another VGAM1465 host target gene. KCNS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KCNS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNS1 BINDING SITE, designated SEQ ID:8048, to the nucleotide sequence of VGAM1465 RNA, herein designated VGAM RNA, also designated SEQ ID:4176.

[50825] Another function of VGAM1465 is therefore inhibition of Potassium Voltage-gated Channel, Delayed-rectifier, Sub-

family S, Member 1 (KCNS1, Accession NM_002251). Accordingly, utilities of VGAM1465 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNS1. KIAA1045 (Accession XM_048592) is another VGAM1465 host target gene. KIAA1045 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1045, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1045 BINDING SITE, designated SEQ ID:35195, to the nucleotide sequence of VGAM1465 RNA, herein designated VGAM RNA, also designated SEQ ID:4176.

[50826] Another function of VGAM1465 is therefore inhibition of KIAA1045 (Accession XM_048592). Accordingly, utilities of VGAM1465 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1045. LOC152195 (Accession XM_098172) is another VGAM1465 host target gene. LOC152195 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152195, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC152195 BINDING SITE, designated SEQ ID:41434, to the nucleotide sequence of VGAM1465 RNA, herein designated VGAM RNA, also designated SEQ ID:4176.

[50827] Another function of VGAM1465 is therefore inhibition of LOC152195 (Accession XM_098172). Accordingly, utilities of VGAM1465 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152195. LOC199990 (Accession XM_114083) is another VGAM1465 host target gene. LOC199990 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC199990, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199990 BINDING SITE, designated SEQ ID:42685, to the nucleotide sequence of VGAM1465 RNA, herein designated VGAM RNA, also designated SEQ ID:4176.

[50828] Another function of VGAM1465 is therefore inhibition of LOC199990 (Accession XM_114083). Accordingly, utilities of VGAM1465 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199990. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1466 (VGAM1466) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50829] VGAM1466 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1466 was detected is described hereinabove with reference to Figs. 1–8.

[50830] VGAM1466 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM1466 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50831] VGAM1466 gene encodes a VGAM1466 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1466 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1466 precursor RNA is designated SEQ ID:1452, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:1452 is located at position 39035 relative to the genome of Equine Herpesvirus 2.

[50832] VGAM1466 precursor RNA folds onto itself, forming VGAM1466 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50833] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1466 folded precursor RNA into VGAM1466 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1466 RNA is designated SEQ ID:4177, and is provided hereinbelow with reference to the sequence listing part.

[50834] VGAM1466 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1466 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1466 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[50835] VGAM1466 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1466 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1466 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1466 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1466 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[50836] The complementary binding of VGAM1466 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1466 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1466 host target RNA into VGAM1466 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50837] It is appreciated that VGAM1466 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1466 host target genes. The mRNA of each one of this plurality of VGAM1466 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1466 RNA, herein designated VGAM RNA, and which when bound by VGAM1466 RNA causes inhibition of translation of respective one or more

VGAM1466 host target proteins.

[50838] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1466 gene, herein designated VGAM GENE, on one or more VGAM1466 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[50839] It is yet further appreciated that a function of VGAM1466 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Spe-

cific functions, and accordingly utilities, of VGAM1466 correlate with, and may be deduced from, the identity of the host target genes which VGAM1466 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50840] Nucleotide sequences of the VGAM1466 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1466 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1466 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1466 are further described hereinbelow with reference to Table 1.

[50841] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1466 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1466 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[50842] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1466 gene, herein designated VGAM is inhibition of expression of VGAM1466 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM1466 correlate with, and may be deduced from, the identity of the target genes which VGAM1466 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[50843] Adenylate Cyclase 6 (ADCY6, Accession NM_015270) is a VGAM1466 host target gene. ADCY6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ADCY6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADCY6 BINDING SITE, designated SEQ ID:17593, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50844] A function of VGAM1466 is therefore inhibition of Adenylate Cyclase 6 (ADCY6, Accession NM_015270), a gene which this a membrane-bound, Ca^{2+} -inhibitable adenylyl cyclase (by similarity). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADCY6. The function of ADCY6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to VGAM22.B-cell CLL/lymphoma 10 (BCL10, Accession NM_003921) is another VGAM1466 host target gene. BCL10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BCL10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL10 BINDING SITE, designated SEQ ID:10010, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50845] Another function of VGAM1466 is therefore inhibition of B-cell CLL/lymphoma 10 (BCL10, Accession NM_003921), a gene which is a positive regulator of lymphocyte proliferation, NF-kappaB activator. Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL10. The function of BCL10 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM433.Caspase Recruitment Domain Family, Member 15 (CARD15, Accession NM_022162) is another VGAM1466 host target gene. CARD15 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CARD15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CARD15 BINDING SITE, designated SEQ ID:22720, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50846] Another function of VGAM1466 is therefore inhibition of Caspase Recruitment Domain Family, Member 15 (CARD15, Accession NM_022162), a gene which serves as an intracellular receptor for bacterial products in monocytes and transduces signals leading to NFkB activation. Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CARD15. The function of CARD15 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM126.CDC6 Cell Division Cycle 6 Homolog (*S. cerevisiae*) (CDC6, Accession NM_001254) is another VGAM1466 host target gene. CDC6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

CDC6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDC6 BINDING SITE, designated SEQ ID:6924, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50847] Another function of VGAM1466 is therefore inhibition of CDC6 Cell Division Cycle 6 Homolog (*S. cerevisiae*) (CDC6, Accession NM_001254), a gene which is a component of the origin recognition complex (orc) that binds origins of replication. Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDC6. The function of CDC6 has been established by previous studies. In yeasts, Cdc6 (*Saccharomyces cerevisiae*) and Cdc18 (*Schizosaccharomyces pombe*) associate with the origin recognition complex (ORC) proteins to render cells competent for DNA replication. Thus, Cdc6 has a critical regulatory role in the initiation of DNA replication in yeast. Williams et al. (1997) isolated cDNAs encoding *Xenopus* and human homologs of yeast CDC6. They designated the human and *Xenopus* proteins p62(cdc6). Independently, in a yeast 2-hybrid assay using PCNA (OMIM Ref. No.

176740) as bait, Saha et al. (1998) isolated cDNAs encoding the human CDC6/Cdc18 homolog. These authors reported that the predicted 560-amino acid human protein shares approximately 33% sequence identity with the 2 yeast proteins. On Western blots of HeLa cell extracts, human CDC6/cdc18 migrates as a 66-kD protein. Although Northern blots indicated that CDC6/Cdc18 mRNA levels peak at the onset of S phase and diminish at the onset of mitosis in HeLa cells, the authors found that total CDC6/Cdc18 protein level is unchanged throughout the cell cycle. Immunofluorescent analysis of epitope-tagged protein revealed that human CDC6/Cdc18 is nuclear in G1- and cytoplasmic in S-phase cells, suggesting that DNA replication may be regulated by either the translocation of this protein between the nucleus and cytoplasm or by selective degradation of the protein in the nucleus. Immunoprecipitation studies showed that human CDC6/Cdc18 associates in vivo with cyclin A (OMIM Ref. No. 123835), CDK2 (OMIM Ref. No. 116953), and ORC1 (OMIM Ref. No. 601902). The association of cyclin-CDK2 with CDC6/Cdc18 was specifically inhibited by a factor present in mitotic cell extracts. Saha et al. (1998) suggested that if the interaction between CDC6/Cdc18 with

the S phase–promoting factor cyclin–CDK2 is essential for the initiation of DNA replication, the mitotic inhibitor of this interaction could prevent a premature interaction until the appropriate time in G1.

[50848] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[50849] Williams, R. S.; Shohet, R. V.; Stillman, B. : A human protein related to yeast Cdc6p. Proc. Nat. Acad. Sci. 94: 142–147, 1997. ; and

[50850] Saha, P.; Chen, J.; Thome, K. C.; Lawlis, S. J.; Hou, Z.–H.; Hendricks, M.; Parvin, J. D.; Dutta, A. : Human CDC6/Cdc18 associates with Orc1 and cyclin–cdk and is selectively eliminated.

[50851] Further studies establishing the function and utilities of CDC6 are found in John Hopkins OMIM database record ID 602627, and in cited publications numbered 8565–856 and 9449 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Cadherin 17, LI Cadherin (liver–intestine) (CDH17, Accession NM_004063) is another VGAM1466 host target gene. CDH17 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by

CDH17, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDH17 BINDING SITE, designated SEQ ID:10271, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50852] Another function of VGAM1466 is therefore inhibition of Cadherin 17, LI Cadherin (liver–intestine) (CDH17, Accession NM_004063), a gene which may have a role in the morphological organization of liver and intestine and involved in intestinal peptide transport. Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDH17. The function of CDH17 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM795. Cholinergic Receptor, Muscarinic 1 (CHRM1, Accession XM_170669) is another VGAM1466 host target gene. CHRM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CHRM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHRM1 BINDING SITE, designated SEQ ID:45442, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50853] Another function of VGAM1466 is therefore inhibition of Cholinergic Receptor, Muscarinic 1 (CHRM1, Accession XM_170669), a gene which mediates various cellular responses. Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHRM1. The function of CHRM1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM302.COX15 Homolog, Cytochrome C Oxidase Assembly Protein (yeast) (COX15, Accession NM_078470) is another VGAM1466 host target gene. COX15 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by COX15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COX15 BINDING SITE, designated SEQ ID:27792, to the

nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50854] Another function of VGAM1466 is therefore inhibition of COX15 Homolog, Cytochrome C Oxidase Assembly Protein (yeast) (COX15, Accession NM_078470). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COX15. Down Syndrome Critical Region Gene 3 (DSCR3, Accession NM_006052) is another VGAM1466 host target gene. DSCR3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DSCR3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DSCR3 BINDING SITE, designated SEQ ID:12689, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50855] Another function of VGAM1466 is therefore inhibition of Down Syndrome Critical Region Gene 3 (DSCR3, Accession NM_006052). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DSCR3. Fibulin 5 (FBLN5,

Accession NM_006329) is another VGAM1466 host target gene. FBLN5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FBLN5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBLN5 BINDING SITE, designated SEQ ID:13025, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50856] Another function of VGAM1466 is therefore inhibition of Fibulin 5 (FBLN5, Accession NM_006329), a gene which promotes adhesion of endothelial cells through interaction of integrins and the rgd motif. Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBLN5. The function of FBLN5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1127. Fibronectin Leucine Rich Transmembrane Protein 2 (FLRT2, Accession NM_013231) is another VGAM1466 host target gene. FLRT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region

of mRNA encoded by FLRT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLRT2 BINDING SITE, designated SEQ ID:14883, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50857] Another function of VGAM1466 is therefore inhibition of Fibronectin Leucine Rich Transmembrane Protein 2 (FLRT2, Accession NM_013231), a gene which may have a function in cell adhesion and/or receptor signaling. Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLRT2. The function of FLRT2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM247.GNE (Accession NM_005476) is another VGAM1466 host target gene. GNE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GNE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

GNE BINDING SITE, designated SEQ ID:11977, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50858] Another function of VGAM1466 is therefore inhibition of GNE (Accession NM_005476), a gene which has roles in sialic acid biosynthesis and regulates cell surface sialylation. Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNE. The function of GNE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM362.GRAF (Accession NM_015071) is another VGAM1466 host target gene. GRAF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GRAF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRAF BINDING SITE, designated SEQ ID:17444, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50859] Another function of VGAM1466 is therefore inhibition of GRAF (Accession NM_015071), a gene which is a GTPase

activating protein for p21–rac. Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRAF. The function of GRAF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM430. Glutamate Receptor, Ionotropic, Kainate 3 (GRIK3, Accession NM_000831) is another VGAM1466 host target gene. GRIK3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GRIK3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRIK3 BINDING SITE, designated SEQ ID:6487, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50860] Another function of VGAM1466 is therefore inhibition of Glutamate Receptor, Ionotropic, Kainate 3 (GRIK3, Accession NM_000831). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRIK3. Kinesin Heavy Chain Member 2 (KIF2, Accession NM_004520) is another

VGAM1466 host target gene. KIF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIF2 BINDING SITE, designated SEQ ID:10849, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50861] Another function of VGAM1466 is therefore inhibition of Kinesin Heavy Chain Member 2 (KIF2, Accession NM_004520). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIF2. LENG4 (Accession NM_024298) is another VGAM1466 host target gene. LENG4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LENG4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LENG4 BINDING SITE, designated SEQ ID:23588, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ

ID:4177.

[50862] Another function of VGAM1466 is therefore inhibition of LENG4 (Accession NM_024298), a gene which may be a transmembrane protein. Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LENG4. The function of LENG4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM259.V-myb Myeloblastosis Viral Oncogene Homolog (avian) (MYB, Accession XM_004256) is another VGAM1466 host target gene. MYB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MYB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYB BINDING SITE, designated SEQ ID:29944, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50863] Another function of VGAM1466 is therefore inhibition of V-myb Myeloblastosis Viral Oncogene Homolog (avian) (MYB, Accession XM_004256). Accordingly, utilities of

VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYB. Neurocalcin Delta (NCALD, Accession NM_032041) is another VGAM1466 host target gene. NCALD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NCALD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NCALD BINDING SITE, designated SEQ ID:25747, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50864] Another function of VGAM1466 is therefore inhibition of Neurocalcin Delta (NCALD, Accession NM_032041). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCALD. Protocadherin Alpha 9 (PCDHA9, Accession NM_014005) is another VGAM1466 host target gene. PCDHA9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHA9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of PCDHA9 BINDING SITE, designated SEQ ID:15213, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50865] Another function of VGAM1466 is therefore inhibition of Protocadherin Alpha 9 (PCDHA9, Accession NM_014005), a gene which is a calcium-dependent cell-adhesion protein. Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA9. The function of PCDHA9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM71. Platelet-derived Growth Factor Receptor, Alpha Polypeptide (PDGFRA, Accession NM_006206) is another VGAM1466 host target gene. PDGFRA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PDGFRA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDGFRA BINDING SITE, designated SEQ ID:12886, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM

RNA, also designated SEQ ID:4177.

[50866] Another function of VGAM1466 is therefore inhibition of Platelet-derived Growth Factor Receptor, Alpha Polypeptide (PDGFRA, Accession NM_006206), a gene which this receptor binds platelet-derived growth factor and has a tyrosine-protein kinase activity. Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDGFRA. The function of PDGFRA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM117. Phosphoprotein Enriched In Astrocytes 15 (PEA15, Accession NM_003768) is another VGAM1466 host target gene. PEA15 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PEA15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PEA15 BINDING SITE, designated SEQ ID:9853, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50867] Another function of VGAM1466 is therefore inhibition of

Phosphoprotein Enriched In Astrocytes 15 (PEA15, Accession NM_003768), a gene which is a phosphoprotein and involved in glucose uptake. Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PEA15. The function of PEA15 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM949. Phosphoinositide-3-kinase, Regulatory Subunit, Polypeptide 1 (p85 alpha) (PIK3R1, Accession XM_043865) is another VGAM1466 host target gene. PIK3R1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PIK3R1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIK3R1 BINDING SITE, designated SEQ ID:34038, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50868] Another function of VGAM1466 is therefore inhibition of Phosphoinositide-3-kinase, Regulatory Subunit, Polypeptide 1 (p85 alpha) (PIK3R1, Accession XM_043865), a gene

which acts as an adapter, for the insulin-stimulated increase in glucose uptake and glycogen synthesis. Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIK3R1. The function of PIK3R1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM826. Protein Phosphatase, EF Hand Calcium-binding Domain 2 (PPEF2, Accession NM_006239) is another VGAM1466 host target gene. PPEF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPEF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPEF2 BINDING SITE, designated SEQ ID:12905, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50869] Another function of VGAM1466 is therefore inhibition of Protein Phosphatase, EF Hand Calcium-binding Domain 2 (PPEF2, Accession NM_006239), a gene which is a homolog of *Drosophila* rdgC. Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with PPEF2. The function of PPEF2 has been established by previous studies. During random sequencing of human retina cDNAs, Sherman et al. (1997) identified a homolog of *Drosophila* rdgC. Full-length cDNAs of the gene, termed PPEF2, predicted a 753-amino acid protein that is 39% identical to that of *Drosophila* rdgC and has a domain structure similar to that of rdgC and PPEF1 (OMIM Ref. No. 300109). Sherman et al. (1997) noted the existence of a shorter alternatively spliced form of PPEF2, termed PPEF2(S), that uses alternative splice acceptor sites in exons 5 and 14 and predicts a 598-amino acid protein lacking EF-hand domains. Northern blot analysis of rat tissues revealed a 3.7-kb PPEF2 mRNA in retina. In situ hybridization and cell fractionation experiments further revealed that the gene is expressed exclusively in the inner segments of the photoreceptor cells of the retina and in the pineal gland. Sherman et al. (1997) stated that the inner segment localization implies that PPEF2 probably does not dephosphorylate rhodopsin and is probably not directly involved in phototransduction. Animal model experiments lend further support to the function of PPEF2. Ramulu et al. (2001) produced mice carrying targeted disruptions in

the Ppef1 and Ppef2 genes. By analyzing both single and double mutant mice, they observed that rod light responses and rhodopsin dephosphorylation kinetics were normal. Furthermore, there was no evidence of retinal degeneration in the PPEF mutant mice. Ramulu et al. (2001) concluded that in contrast to loss of rdgC function in *Drosophila*, elimination of PPEF function does not cause retinal degeneration in vertebrates.

[50870] It is appreciated that the abovementioned animal model for PPEF2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[50871] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[50872] Ramulu, P.; Kennedy, M.; Xiong, W.-H.; Williams, J.; Cowan, M.; Blesh, D.; Yau, K.-W.; Hurley, J. B.; Nathans, J. : Normal light response, photoreceptor integrity, and rhodopsin dephosphorylation in mice lacking both protein phosphatases with EF hands (PPEF-1 and PPEF-2). *Molec. Cell. Biol.* 21: 8605-8614, 2001. ; and

[50873] Sherman, P. M.; Sun, H.; Macke, J. P.; Williams, J.; Smallwood, P. M.; Nathans, J. : Identification and characteriza-

tion of a conserved family of protein serine/threonine phosphatases h.

[50874] Further studies establishing the function and utilities of PPEF2 are found in John Hopkins OMIM database record ID 602256, and in cited publications numbered 10627 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Rabphilin 3A-like (without C2 domains) (RPH3AL, Accession NM_006987) is another VGAM1466 host target gene. RPH3AL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RPH3AL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RPH3AL BINDING SITE, designated SEQ ID:13849, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50875] Another function of VGAM1466 is therefore inhibition of Rabphilin 3A-like (without C2 domains) (RPH3AL, Accession NM_006987), a gene which is a protein transporter. could play a role in neurotransmitter release by regulating membrane flow in the nerve terminal. Accordingly, utilities of VGAM1466 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with RPH3AL. The function of RPH3AL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM923. Spondyloepiphyseal Dysplasia, Late (SEDL, Accession NM_014563) is another VGAM1466 host target gene. SEDL BINDING SITE1 and SEDL BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SEDL, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEDL BINDING SITE1 and SEDL BINDING SITE2, designated SEQ ID:15915 and SEQ ID:15916 respectively, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50876] Another function of VGAM1466 is therefore inhibition of Spondyloepiphyseal Dysplasia, Late (SEDL, Accession NM_014563), a gene which may play role in vesicular transport from endoplasmic reticulum to golgi. Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEDL. The function of SEDL and its association

with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74. Solute Carrier Family 22 (organic anion/cation transporter), Member 12 (SLC22A12, Accession NM_144585) is another VGAM1466 host target gene. SLC22A12 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SLC22A12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC22A12 BINDING SITE, designated SEQ ID:29405, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50877] Another function of VGAM1466 is therefore inhibition of Solute Carrier Family 22 (organic anion/cation transporter), Member 12 (SLC22A12, Accession NM_144585), a gene which is a urate -anion exchanger regulating blood urate levels. Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC22A12. The function of SLC22A12 and its association with various diseases and clinical conditions, has been established by previous stud-

ies, as described hereinabove with reference to VGAM1034. Thromboxane A2 Receptor (TBXA2R, Accession NM_001060) is another VGAM1466 host target gene. TBXA2R BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TBXA2R, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TBXA2R BINDING SITE, designated SEQ ID:6731, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50878] Another function of VGAM1466 is therefore inhibition of Thromboxane A2 Receptor (TBXA2R, Accession NM_001060), a gene which activates Ca²⁺-activated chloride channels; stimulates platelet aggregation and smooth muscle constriction. Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TBXA2R. The function of TBXA2R and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM433. Tec Protein Tyrosine Kinase (TEC,

Accession NM_003215) is another VGAM1466 host target gene. TEC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TEC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TEC BINDING SITE, designated SEQ ID:9219, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50879] Another function of VGAM1466 is therefore inhibition of Tec Protein Tyrosine Kinase (TEC, Accession NM_003215). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TEC. Trichorhinophalangeal Syndrome I (TRPS1, Accession NM_014112) is another VGAM1466 host target gene. TRPS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRPS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPS1 BINDING SITE, designated SEQ ID:15357, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4177.

[50880] Another function of VGAM1466 is therefore inhibition of Trichorhinophalangeal Syndrome I (TRPS1, Accession NM_014112), a gene which may function as a transcriptional activator protein. Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPS1. The function of TRPS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM172. Ubiquitin Specific Protease 9, Y Chromosome (fat facets-like Drosophila) (USP9Y, Accession XM_034147) is another VGAM1466 host target gene. USP9Y BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by USP9Y, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of USP9Y BINDING SITE, designated SEQ ID:32018, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50881] Another function of VGAM1466 is therefore inhibition of

Ubiquitin Specific Protease 9, Y Chromosome (fat facets-like *Drosophila*) (USP9Y, Accession XM_034147), a gene which removes ubiquitin from ubiquitin-conjugated proteins and has a role in spermatogenesis. Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with USP9Y. The function of USP9Y and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM894. Wolf-Hirschhorn Syndrome Candidate 1 (WHSC1, Accession NM_014919) is another VGAM1466 host target gene. WHSC1 BINDING SITE1 through WHSC1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by WHSC1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WHSC1 BINDING SITE1 through WHSC1 BINDING SITE3, designated SEQ ID:17185, SEQ ID:28449 and SEQ ID:28466 respectively, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50882] Another function of VGAM1466 is therefore inhibition of

Wolf-Hirschhorn Syndrome Candidate 1 (WHSC1, Accession NM_014919), a gene which binds covalently to and repairs g/t mismatches. Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WHSC1. The function of WHSC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200. Ras Homolog Gene Family, Member F (in filopodia) (ARHF, Accession NM_019034) is another VGAM1466 host target gene. ARHF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARHF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHF BINDING SITE, designated SEQ ID:21122, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50883] Another function of VGAM1466 is therefore inhibition of Ras Homolog Gene Family, Member F (in filopodia) (ARHF, Accession NM_019034). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with ARHF. ARPP-19 (Accession NM_006628) is another VGAM1466 host target gene. ARPP-19 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ARPP-19, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARPP-19 BINDING SITE, designated SEQ ID:13425, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50884] Another function of VGAM1466 is therefore inhibition of ARPP-19 (Accession NM_006628). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARPP-19. Chromosome 11 Open Reading Frame 25 (C11orf25, Accession NM_031418) is another VGAM1466 host target gene. C11orf25 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C11orf25, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C11orf25 BINDING SITE, designated

SEQ ID:25401, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50885] Another function of VGAM1466 is therefore inhibition of Chromosome 11 Open Reading Frame 25 (C11orf25, Accession NM_031418). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C11orf25. C1q and Tumor Necrosis Factor Related Protein 6 (C1QTNF6, Accession NM_031910) is another VGAM1466 host target gene. C1QTNF6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C1QTNF6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1QTNF6 BINDING SITE, designated SEQ ID:25660, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50886] Another function of VGAM1466 is therefore inhibition of C1q and Tumor Necrosis Factor Related Protein 6 (C1QTNF6, Accession NM_031910). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with C1QTNF6. Chromosome 9 Open Reading Frame 9 (C9orf9, Accession NM_018956) is another VGAM1466 host target gene. C9orf9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C9orf9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C9orf9 BINDING SITE, designated SEQ ID:21030, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50887] Another function of VGAM1466 is therefore inhibition of Chromosome 9 Open Reading Frame 9 (C9orf9, Accession NM_018956). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C9orf9. Calneuron 1 (CALN1, Accession NM_031468) is another VGAM1466 host target gene. CALN1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CALN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of CALN1 BINDING SITE, designated SEQ ID:25520, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50888] Another function of VGAM1466 is therefore inhibition of Calneuron 1 (CALN1, Accession NM_031468). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CALN1. Caspase Recruitment Domain Family, Member 6 (CARD6, Accession NM_032587) is another VGAM1466 host target gene. CARD6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CARD6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CARD6 BINDING SITE, designated SEQ ID:26323, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50889] Another function of VGAM1466 is therefore inhibition of Caspase Recruitment Domain Family, Member 6 (CARD6, Accession NM_032587). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with CARD6. Chromobox Homolog 6 (CBX6, Accession NM_014292) is another VGAM1466 host target gene. CBX6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CBX6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CBX6 BINDING SITE, designated SEQ ID:15579, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50890] Another function of VGAM1466 is therefore inhibition of Chromobox Homolog 6 (CBX6, Accession NM_014292). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CBX6. CDC14 Cell Division Cycle 14 Homolog A (*S. cerevisiae*) (CDC14A, Accession NM_003672) is another VGAM1466 host target gene. CDC14A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CDC14A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of CDC14A BINDING SITE, designated SEQ ID:9766, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50891] Another function of VGAM1466 is therefore inhibition of CDC14 Cell Division Cycle 14 Homolog A (*S. cerevisiae*) (CDC14A, Accession NM_003672). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDC14A. Chromatin Accessibility Complex 1 (CHRAC1, Accession NM_017444) is another VGAM1466 host target gene. CHRAC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CHRAC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHRAC1 BINDING SITE, designated SEQ ID:18906, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50892] Another function of VGAM1466 is therefore inhibition of Chromatin Accessibility Complex 1 (CHRAC1, Accession NM_017444). Accordingly, utilities of VGAM1466 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with CHRAC1. DKFZP434F0318 (Accession NM_030817) is another VGAM1466 host target gene. DKFZP434F0318 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434F0318, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434F0318 BINDING SITE, designated SEQ ID:25144, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50893] Another function of VGAM1466 is therefore inhibition of DKFZP434F0318 (Accession NM_030817). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434F0318. DKFZP564G092 (Accession NM_015601) is another VGAM1466 host target gene. DKFZP564G092 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZP564G092, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the

nucleotide sequences of DKFZP564G092 BINDING SITE, designated SEQ ID:17878, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50894] Another function of VGAM1466 is therefore inhibition of DKFZP564G092 (Accession NM_015601). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564G092. DKFZP564O0463 (Accession NM_014156) is another VGAM1466 host target gene. DKFZP564O0463 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564O0463, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564O0463 BINDING SITE, designated SEQ ID:15446, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50895] Another function of VGAM1466 is therefore inhibition of DKFZP564O0463 (Accession NM_014156). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with DKFZP564O0463. DKFZp761O0113 (Accession NM_018409) is another VGAM1466 host target gene. DKFZp761O0113 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZp761O0113, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761O0113 BINDING SITE, designated SEQ ID:20449, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50896] Another function of VGAM1466 is therefore inhibition of DKFZp761O0113 (Accession NM_018409). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761O0113. Eukaryotic Translation Initiation Factor 2C, 2 (EIF2C2, Accession XM_050334) is another VGAM1466 host target gene. EIF2C2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EIF2C2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EIF2C2 BIND-

ING SITE, designated SEQ ID:35614, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50897] Another function of VGAM1466 is therefore inhibition of Eukaryotic Translation Initiation Factor 2C, 2 (EIF2C2, Accession XM_050334). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EIF2C2. FLJ12903 (Accession NM_022753) is another VGAM1466 host target gene. FLJ12903 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12903, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12903 BINDING SITE, designated SEQ ID:22984, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50898] Another function of VGAM1466 is therefore inhibition of FLJ12903 (Accession NM_022753). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12903. FLJ13188 (Accession NM_022063) is another

VGAM1466 host target gene. FLJ13188 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13188, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13188 BINDING SITE, designated SEQ ID:22607, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50899] Another function of VGAM1466 is therefore inhibition of FLJ13188 (Accession NM_022063). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13188. FLJ13197 (Accession NM_024614) is another VGAM1466 host target gene. FLJ13197 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13197, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13197 BINDING SITE, designated SEQ ID:23875, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50900] Another function of VGAM1466 is therefore inhibition of FLJ13197 (Accession NM_024614). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13197. FLJ14084 (Accession NM_021637) is another VGAM1466 host target gene. FLJ14084 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14084, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14084 BINDING SITE, designated SEQ ID:22285, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50901] Another function of VGAM1466 is therefore inhibition of FLJ14084 (Accession NM_021637). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14084. FLJ14950 (Accession NM_032865) is another VGAM1466 host target gene. FLJ14950 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14950, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14950 BINDING SITE, designated SEQ ID:26678, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50902] Another function of VGAM1466 is therefore inhibition of FLJ14950 (Accession NM_032865). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14950. FLJ14957 (Accession NM_032866) is another VGAM1466 host target gene. FLJ14957 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14957, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14957 BINDING SITE, designated SEQ ID:26685, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50903] Another function of VGAM1466 is therefore inhibition of FLJ14957 (Accession NM_032866). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ14957. FLJ20010 (Accession NM_019021) is another VGAM1466 host target gene. FLJ20010 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20010, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20010 BINDING SITE, designated SEQ ID:21110, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50904] Another function of VGAM1466 is therefore inhibition of FLJ20010 (Accession NM_019021). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20010. FLJ20695 (Accession NM_017929) is another VGAM1466 host target gene. FLJ20695 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20695, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20695 BINDING SITE, designated SEQ ID:19615, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM

RNA, also designated SEQ ID:4177.

[50905] Another function of VGAM1466 is therefore inhibition of FLJ20695 (Accession NM_017929). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20695. FLJ22944 (Accession NM_025145) is another VGAM1466 host target gene. FLJ22944 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22944, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22944 BINDING SITE, designated SEQ ID:24784, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50906] Another function of VGAM1466 is therefore inhibition of FLJ22944 (Accession NM_025145). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22944. FLJ23519 (Accession NM_032240) is another VGAM1466 host target gene. FLJ23519 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23519, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23519 BINDING SITE, designated SEQ ID:25978, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50907] Another function of VGAM1466 is therefore inhibition of FLJ23519 (Accession NM_032240). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23519. FLJ31101 (Accession NM_017964) is another VGAM1466 host target gene. FLJ31101 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ31101, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ31101 BINDING SITE, designated SEQ ID:19687, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50908] Another function of VGAM1466 is therefore inhibition of FLJ31101 (Accession NM_017964). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ31101. FLJ31153 (Accession NM_144600) is another VGAM1466 host target gene. FLJ31153 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ31153, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ31153 BINDING SITE, designated SEQ ID:29415, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50909] Another function of VGAM1466 is therefore inhibition of FLJ31153 (Accession NM_144600). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31153. GREB1 (Accession NM_014668) is another VGAM1466 host target gene. GREB1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GREB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GREB1 BINDING SITE, designated SEQ ID:16126, to the nucleotide sequence of

VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50910] Another function of VGAM1466 is therefore inhibition of GREB1 (Accession NM_014668). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GREB1. GRP3 (Accession NM_015376) is another VGAM1466 host target gene. GRP3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GRP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRP3 BINDING SITE, designated SEQ ID:17674, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50911] Another function of VGAM1466 is therefore inhibition of GRP3 (Accession NM_015376). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRP3. HSMPP8 (Accession XM_167894) is another VGAM1466 host target gene. HSMPP8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by HSMPP8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSMPP8 BINDING SITE, designated SEQ ID:44905, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50912] Another function of VGAM1466 is therefore inhibition of HSMPP8 (Accession XM_167894). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSMPP8. JM11 (Accession NM_033626) is another VGAM1466 host target gene. JM11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by JM11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JM11 BINDING SITE, designated SEQ ID:27333, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50913] Another function of VGAM1466 is therefore inhibition of JM11 (Accession NM_033626). Accordingly, utilities of

VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JM11. KIAA0087 (Accession NM_014769) is another VGAM1466 host target gene. KIAA0087 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0087, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0087 BINDING SITE, designated SEQ ID:16561, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50914] Another function of VGAM1466 is therefore inhibition of KIAA0087 (Accession NM_014769). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0087. KIAA0352 (Accession NM_014830) is another VGAM1466 host target gene. KIAA0352 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0352, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA0352 BINDING SITE, designated SEQ ID:16826, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50915] Another function of VGAM1466 is therefore inhibition of KIAA0352 (Accession NM_014830). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0352. KIAA0449 (Accession NM_017596) is another VGAM1466 host target gene. KIAA0449 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0449, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0449 BINDING SITE, designated SEQ ID:19054, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50916] Another function of VGAM1466 is therefore inhibition of KIAA0449 (Accession NM_017596). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0449. KIAA0472 (Accession XM_050147) is another VGAM1466 host target gene. KIAA0472 BINDING SITE is

HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0472, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0472 BINDING SITE, designated SEQ ID:35584, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50917] Another function of VGAM1466 is therefore inhibition of KIAA0472 (Accession XM_050147). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0472. KIAA0513 (Accession NM_014732) is another VGAM1466 host target gene. KIAA0513 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0513, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0513 BINDING SITE, designated SEQ ID:16364, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50918] Another function of VGAM1466 is therefore inhibition of

KIAA0513 (Accession NM_014732). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0513. KIAA0557 (Accession XM_085507) is another VGAM1466 host target gene. KIAA0557 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0557, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0557 BINDING SITE, designated SEQ ID:38213, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50919] Another function of VGAM1466 is therefore inhibition of KIAA0557 (Accession XM_085507). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0557. KIAA0828 (Accession XM_088105) is another VGAM1466 host target gene. KIAA0828 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0828, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA0828 BINDING SITE, designated SEQ ID:39516, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50920] Another function of VGAM1466 is therefore inhibition of KIAA0828 (Accession XM_088105). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0828. KIAA0831 (Accession NM_014924) is another VGAM1466 host target gene. KIAA0831 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0831, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0831 BINDING SITE, designated SEQ ID:17210, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50921] Another function of VGAM1466 is therefore inhibition of KIAA0831 (Accession NM_014924). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0831. KIAA1198 (Accession XM_032674) is another

VGAM1466 host target gene. KIAA1198 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1198, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1198 BINDING SITE, designated SEQ ID:31719, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50922] Another function of VGAM1466 is therefore inhibition of KIAA1198 (Accession XM_032674). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1198. KIAA1257 (Accession XM_031577) is another VGAM1466 host target gene. KIAA1257 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1257, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1257 BINDING SITE, designated SEQ ID:31443, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50923] Another function of VGAM1466 is therefore inhibition of KIAA1257 (Accession XM_031577). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1257. KIAA1430 (Accession XM_087593) is another VGAM1466 host target gene. KIAA1430 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1430, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1430 BINDING SITE, designated SEQ ID:39358, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50924] Another function of VGAM1466 is therefore inhibition of KIAA1430 (Accession XM_087593). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1430. KIAA1500 (Accession XM_034353) is another VGAM1466 host target gene. KIAA1500 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1500, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1500 BINDING SITE, designated SEQ ID:32070, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50925] Another function of VGAM1466 is therefore inhibition of KIAA1500 (Accession XM_034353). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1500. KIAA1655 (Accession XM_039442) is another VGAM1466 host target gene. KIAA1655 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1655, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1655 BINDING SITE, designated SEQ ID:33092, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50926] Another function of VGAM1466 is therefore inhibition of KIAA1655 (Accession XM_039442). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1655. KIAA1727 (Accession XM_034262) is another VGAM1466 host target gene. KIAA1727 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1727, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1727 BINDING SITE, designated SEQ ID:32037, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50927] Another function of VGAM1466 is therefore inhibition of KIAA1727 (Accession XM_034262). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1727. KIAA1971 (Accession XM_058720) is another VGAM1466 host target gene. KIAA1971 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1971, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1971 BINDING SITE, designated SEQ ID:36732, to the nucleotide sequence of VGAM1466 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4177.

[50928] Another function of VGAM1466 is therefore inhibition of KIAA1971 (Accession XM_058720). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1971. Kallikrein 7 (chymotryptic, stratum corneum) (KLK7, Accession NM_139277) is another VGAM1466 host target gene. KLK7 BINDING SITE1 and KLK7 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KLK7, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KLK7 BINDING SITE1 and KLK7 BINDING SITE2, designated SEQ ID:29275 and SEQ ID:11478 respectively, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50929] Another function of VGAM1466 is therefore inhibition of Kallikrein 7 (chymotryptic, stratum corneum) (KLK7, Accession NM_139277). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLK7. MGC21675 (Accession NM_052861) is another VGAM1466 host target

gene. MGC21675 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC21675, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC21675 BINDING SITE, designated SEQ ID:27446, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50930] Another function of VGAM1466 is therefore inhibition of MGC21675 (Accession NM_052861). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC21675. MGC4707 (Accession NM_024113) is another VGAM1466 host target gene. MGC4707 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC4707, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4707 BINDING SITE, designated SEQ ID:23565, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50931] Another function of VGAM1466 is therefore inhibition of MGC4707 (Accession NM_024113). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4707. Ninjurin 2 (NINJ2, Accession NM_016533) is another VGAM1466 host target gene. NINJ2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NINJ2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NINJ2 BINDING SITE, designated SEQ ID:18606, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50932] Another function of VGAM1466 is therefore inhibition of Ninjurin 2 (NINJ2, Accession NM_016533). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NINJ2. Nup43 (Accession NM_024647) is another VGAM1466 host target gene. Nup43 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by Nup43, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Nup43 BINDING SITE, designated SEQ ID:23938, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50933] Another function of VGAM1466 is therefore inhibition of Nup43 (Accession NM_024647). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Nup43. OCT11 (Accession NM_014352) is another VGAM1466 host target gene. OCT11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OCT11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OCT11 BINDING SITE, designated SEQ ID:15680, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50934] Another function of VGAM1466 is therefore inhibition of OCT11 (Accession NM_014352). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OCT11.

PAI-RBP1 (Accession NM_015640) is another VGAM1466 host target gene. PAI-RBP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PAI-RBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAI-RBP1 BINDING SITE, designated SEQ ID:17894, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50935] Another function of VGAM1466 is therefore inhibition of PAI-RBP1 (Accession NM_015640). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAI-RBP1. Pellino Homolog 1 (Drosophila) (PELI1, Accession NM_020651) is another VGAM1466 host target gene. PELI1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PELI1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PELI1 BINDING SITE, designated SEQ ID:21818, to the nucleotide sequence of VGAM1466 RNA, herein

designated VGAM RNA, also designated SEQ ID:4177.

[50936] Another function of VGAM1466 is therefore inhibition of Pellino Homolog 1 (Drosophila) (PELI1, Accession NM_020651). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PELI1. PIP3-E (Accession XM_039749) is another VGAM1466 host target gene. PIP3-E BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PIP3-E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIP3-E BINDING SITE, designated SEQ ID:33181, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50937] Another function of VGAM1466 is therefore inhibition of PIP3-E (Accession XM_039749). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIP3-E. Protein Phosphatase 1, Regulatory (inhibitor) Subunit 3B (PPP1R3B, Accession NM_024607) is another VGAM1466 host target gene. PPP1R3B BINDING SITE is HOST TARGET

binding site found in the 3` untranslated region of mRNA encoded by PPP1R3B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R3B BINDING SITE, designated SEQ ID:23858, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50938] Another function of VGAM1466 is therefore inhibition of Protein Phosphatase 1, Regulatory (inhibitor) Subunit 3B (PPP1R3B, Accession NM_024607). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R3B. PRO2198 (Accession NM_018621) is another VGAM1466 host target gene. PRO2198 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRO2198, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2198 BINDING SITE, designated SEQ ID:20695, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50939] Another function of VGAM1466 is therefore inhibition of PRO2198 (Accession NM_018621). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2198. Ras Association (RalGDS/AF-6) Domain Family 2 (RASSF2, Accession NM_014737) is another VGAM1466 host target gene. RASSF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RASSF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RASSF2 BINDING SITE, designated SEQ ID:16398, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50940] Another function of VGAM1466 is therefore inhibition of Ras Association (RalGDS/AF-6) Domain Family 2 (RASSF2, Accession NM_014737). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RASSF2. RGPR (Accession NM_033127) is another VGAM1466 host target gene. RGPR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region

of mRNA encoded by RGPR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RGPR BINDING SITE, designated SEQ ID:26971, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50941] Another function of VGAM1466 is therefore inhibition of RGPR (Accession NM_033127). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RGPR. SCYA22 (Accession XM_165651) is another VGAM1466 host target gene. SCYA22 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCYA22, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCYA22 BINDING SITE, designated SEQ ID:43717, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50942] Another function of VGAM1466 is therefore inhibition of SCYA22 (Accession XM_165651). Accordingly, utilities of

VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCYA22. Sema Domain, Immunoglobulin Domain (Ig), Transmembrane Domain (TM) and Short Cytoplasmic Domain, (semaphorin) 4F (SEMA4F, Accession NM_004263) is another VGAM1466 host target gene. SEMA4F BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEMA4F, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEMA4F BINDING SITE, designated SEQ ID:10461, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50943] Another function of VGAM1466 is therefore inhibition of Sema Domain, Immunoglobulin Domain (Ig), Transmembrane Domain (TM) and Short Cytoplasmic Domain, (semaphorin) 4F (SEMA4F, Accession NM_004263). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEMA4F. Solute Carrier Family 6 (neurotransmitter transporter), Member 14 (SLC6A14, Accession NM_007231) is another VGAM1466 host target

gene. SLC6A14 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC6A14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC6A14 BINDING SITE, designated SEQ ID:14105, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50944] Another function of VGAM1466 is therefore inhibition of Solute Carrier Family 6 (neurotransmitter transporter), Member 14 (SLC6A14, Accession NM_007231). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC6A14. T-cell Leukemia/lymphoma 6 (TCL6, Accession NM_014418) is another VGAM1466 host target gene. TCL6 BINDING SITE1 through TCL6 BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TCL6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCL6 BINDING SITE1 through TCL6 BINDING SITE4, designated SEQ

ID:15771, SEQ ID:21764, SEQ ID:21773 and SEQ ID:14847 respectively, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50945] Another function of VGAM1466 is therefore inhibition of T-cell Leukemia/lymphoma 6 (TCL6, Accession NM_014418). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCL6. TUSP (Accession NM_020245) is another VGAM1466 host target gene. TUSP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TUSP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TUSP BINDING SITE, designated SEQ ID:21537, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50946] Another function of VGAM1466 is therefore inhibition of TUSP (Accession NM_020245). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TUSP. Wingless-type MMTV Integration Site Family, Member 10A

(WNT10A, Accession NM_025216) is another VGAM1466 host target gene. WNT10A BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by WNT10A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WNT10A BINDING SITE, designated SEQ ID:24895, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50947] Another function of VGAM1466 is therefore inhibition of Wingless-type MMTV Integration Site Family, Member 10A (WNT10A, Accession NM_025216). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WNT10A. ZF5128 (Accession NM_014347) is another VGAM1466 host target gene. ZF5128 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZF5128, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZF5128 BINDING SITE, designated SEQ ID:15672, to the nucleotide

sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50948] Another function of VGAM1466 is therefore inhibition of ZF5128 (Accession NM_014347). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZF5128. ZFP106 (Accession NM_022473) is another VGAM1466 host target gene. ZFP106 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZFP106, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZFP106 BINDING SITE, designated SEQ ID:22837, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50949] Another function of VGAM1466 is therefore inhibition of ZFP106 (Accession NM_022473). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFP106. LOC112817 (Accession NM_138413) is another VGAM1466 host target gene. LOC112817 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by LOC112817, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC112817 BINDING SITE, designated SEQ ID:28783, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50950] Another function of VGAM1466 is therefore inhibition of LOC112817 (Accession NM_138413). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC112817. LOC121504 (Accession XM_058571) is another VGAM1466 host target gene. LOC121504 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC121504, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC121504 BINDING SITE, designated SEQ ID:36671, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50951] Another function of VGAM1466 is therefore inhibition of LOC121504 (Accession XM_058571). Accordingly, utilities

of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC121504. LOC128989 (Accession XM_059310) is another VGAM1466 host target gene. LOC128989 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC128989, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC128989 BINDING SITE, designated SEQ ID:36947, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50952] Another function of VGAM1466 is therefore inhibition of LOC128989 (Accession XM_059310). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC128989. LOC135818 (Accession XM_059804) is another VGAM1466 host target gene. LOC135818 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC135818, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC135818 BINDING SITE, designated SEQ ID:37097, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50953] Another function of VGAM1466 is therefore inhibition of LOC135818 (Accession XM_059804). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC135818. LOC145371 (Accession XM_085123) is another VGAM1466 host target gene. LOC145371 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145371, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145371 BINDING SITE, designated SEQ ID:37850, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50954] Another function of VGAM1466 is therefore inhibition of LOC145371 (Accession XM_085123). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145371. LOC145678 (Accession XM_096832) is another VGAM1466 host target gene. LOC145678 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145678, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145678 BINDING SITE, designated SEQ ID:40556, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50955] Another function of VGAM1466 is therefore inhibition of LOC145678 (Accession XM_096832). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145678. LOC145813 (Accession XM_096873) is another VGAM1466 host target gene. LOC145813 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145813, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145813 BINDING SITE, designated SEQ ID:40599, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50956] Another function of VGAM1466 is therefore inhibition of

LOC145813 (Accession XM_096873). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145813. LOC146894 (Accession NM_145273) is another VGAM1466 host target gene. LOC146894 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146894, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146894 BINDING SITE, designated SEQ ID:29785, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50957] Another function of VGAM1466 is therefore inhibition of LOC146894 (Accession NM_145273). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146894. LOC146909 (Accession XM_085634) is another VGAM1466 host target gene. LOC146909 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146909, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC146909 BINDING SITE, designated SEQ ID:38271, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50958] Another function of VGAM1466 is therefore inhibition of LOC146909 (Accession XM_085634). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146909. LOC148887 (Accession XM_097537) is another VGAM1466 host target gene. LOC148887 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148887, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148887 BINDING SITE, designated SEQ ID:40913, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50959] Another function of VGAM1466 is therefore inhibition of LOC148887 (Accession XM_097537). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148887. LOC152018 (Accession XM_098156) is an-

other VGAM1466 host target gene. LOC152018 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC152018, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152018 BINDING SITE, designated SEQ ID:41424, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50960] Another function of VGAM1466 is therefore inhibition of LOC152018 (Accession XM_098156). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152018. LOC153077 (Accession XM_098307) is another VGAM1466 host target gene. LOC153077 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC153077, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153077 BINDING SITE, designated SEQ ID:41571, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50961] Another function of VGAM1466 is therefore inhibition of LOC153077 (Accession XM_098307). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153077. LOC153454 (Accession XM_087672) is another VGAM1466 host target gene. LOC153454 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC153454, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153454 BINDING SITE, designated SEQ ID:39377, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50962] Another function of VGAM1466 is therefore inhibition of LOC153454 (Accession XM_087672). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153454. LOC154877 (Accession XM_098626) is another VGAM1466 host target gene. LOC154877 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC154877, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154877 BINDING SITE, designated SEQ ID:41747, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50963] Another function of VGAM1466 is therefore inhibition of LOC154877 (Accession XM_098626). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154877. LOC158476 (Accession XM_098955) is another VGAM1466 host target gene. LOC158476 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158476, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158476 BINDING SITE, designated SEQ ID:42001, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50964] Another function of VGAM1466 is therefore inhibition of LOC158476 (Accession XM_098955). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC158476. LOC158865 (Accession XM_099000) is another VGAM1466 host target gene. LOC158865 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158865, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158865 BINDING SITE, designated SEQ ID:42039, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50965] Another function of VGAM1466 is therefore inhibition of LOC158865 (Accession XM_099000). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158865. LOC162333 (Accession XM_102591) is another VGAM1466 host target gene. LOC162333 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC162333, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC162333 BINDING SITE, designated SEQ ID:42138, to the nucleotide sequence of VGAM1466 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4177.

[50966] Another function of VGAM1466 is therefore inhibition of LOC162333 (Accession XM_102591). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC162333. LOC164955 (Accession XM_092265) is another VGAM1466 host target gene. LOC164955 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC164955, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC164955 BINDING SITE, designated SEQ ID:40113, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50967] Another function of VGAM1466 is therefore inhibition of LOC164955 (Accession XM_092265). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC164955. LOC169225 (Accession XM_108531) is another VGAM1466 host target gene. LOC169225 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC169225, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC169225 BINDING SITE, designated SEQ ID:42205, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50968] Another function of VGAM1466 is therefore inhibition of LOC169225 (Accession XM_108531). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC169225. LOC196529 (Accession XM_113746) is another VGAM1466 host target gene. LOC196529 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196529, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196529 BINDING SITE, designated SEQ ID:42412, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50969] Another function of VGAM1466 is therefore inhibition of LOC196529 (Accession XM_113746). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC196529. LOC199786 (Accession XM_114021) is another VGAM1466 host target gene. LOC199786 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC199786, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199786 BINDING SITE, designated SEQ ID:42623, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50970] Another function of VGAM1466 is therefore inhibition of LOC199786 (Accession XM_114021). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199786. LOC200316 (Accession XM_114205) is another VGAM1466 host target gene. LOC200316 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200316, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200316 BINDING SITE, designated SEQ ID:42796, to the nucleotide sequence of VGAM1466 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4177.

[50971] Another function of VGAM1466 is therefore inhibition of LOC200316 (Accession XM_114205). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200316. LOC200982 (Accession XM_117305) is another VGAM1466 host target gene. LOC200982 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200982, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200982 BINDING SITE, designated SEQ ID:43379, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50972] Another function of VGAM1466 is therefore inhibition of LOC200982 (Accession XM_117305). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200982. LOC201626 (Accession XM_114349) is another VGAM1466 host target gene. LOC201626 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC201626, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201626 BINDING SITE, designated SEQ ID:42892, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50973] Another function of VGAM1466 is therefore inhibition of LOC201626 (Accession XM_114349). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201626. LOC203197 (Accession XM_114645) is another VGAM1466 host target gene. LOC203197 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203197, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203197 BINDING SITE, designated SEQ ID:43013, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50974] Another function of VGAM1466 is therefore inhibition of LOC203197 (Accession XM_114645). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC203197. LOC220064 (Accession XM_167827) is another VGAM1466 host target gene. LOC220064 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220064, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220064 BINDING SITE, designated SEQ ID:44870, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50975] Another function of VGAM1466 is therefore inhibition of LOC220064 (Accession XM_167827). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220064. LOC220074 (Accession NM_145309) is another VGAM1466 host target gene. LOC220074 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220074, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220074 BINDING SITE, designated SEQ ID:29825, to

the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50976] Another function of VGAM1466 is therefore inhibition of LOC220074 (Accession NM_145309). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220074. LOC221964 (Accession XM_168342) is another VGAM1466 host target gene. LOC221964 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221964, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221964 BINDING SITE, designated SEQ ID:45114, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50977] Another function of VGAM1466 is therefore inhibition of LOC221964 (Accession XM_168342). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221964. LOC222031 (Accession XM_168371) is another VGAM1466 host target gene. LOC222031 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC222031, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222031 BINDING SITE, designated SEQ ID:45138, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50978] Another function of VGAM1466 is therefore inhibition of LOC222031 (Accession XM_168371). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222031. LOC222224 (Accession XM_168473) is another VGAM1466 host target gene. LOC222224 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222224, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222224 BINDING SITE, designated SEQ ID:45198, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50979] Another function of VGAM1466 is therefore inhibition of LOC222224 (Accession XM_168473). Accordingly, utilities

of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222224. LOC253981 (Accession XM_171064) is another VGAM1466 host target gene. LOC253981 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253981, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253981 BINDING SITE, designated SEQ ID:45868, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50980] Another function of VGAM1466 is therefore inhibition of LOC253981 (Accession XM_171064). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253981. LOC254057 (Accession XM_173085) is another VGAM1466 host target gene. LOC254057 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254057, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC254057 BINDING SITE, designated SEQ ID:46351, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50981] Another function of VGAM1466 is therefore inhibition of LOC254057 (Accession XM_173085). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254057. LOC256306 (Accession XM_172976) is another VGAM1466 host target gene. LOC256306 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC256306, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256306 BINDING SITE, designated SEQ ID:46240, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50982] Another function of VGAM1466 is therefore inhibition of LOC256306 (Accession XM_172976). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256306. LOC257127 (Accession XM_172975) is another VGAM1466 host target gene. LOC257127 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257127, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257127 BINDING SITE, designated SEQ ID:46232, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50983] Another function of VGAM1466 is therefore inhibition of LOC257127 (Accession XM_172975). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257127. LOC51008 (Accession NM_015947) is another VGAM1466 host target gene. LOC51008 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC51008, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51008 BINDING SITE, designated SEQ ID:18065, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50984] Another function of VGAM1466 is therefore inhibition of

LOC51008 (Accession NM_015947). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51008. LOC90288 (Accession XM_030669) is another VGAM1466 host target gene. LOC90288 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90288, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90288 BINDING SITE, designated SEQ ID:31117, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50985] Another function of VGAM1466 is therefore inhibition of LOC90288 (Accession XM_030669). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90288. LOC90459 (Accession XM_031826) is another VGAM1466 host target gene. LOC90459 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90459, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC90459 BINDING SITE, designated SEQ ID:31494, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50986] Another function of VGAM1466 is therefore inhibition of LOC90459 (Accession XM_031826). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90459. LOC96597 (Accession XM_039922) is another VGAM1466 host target gene. LOC96597 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC96597, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC96597 BINDING SITE, designated SEQ ID:33231, to the nucleotide sequence of VGAM1466 RNA, herein designated VGAM RNA, also designated SEQ ID:4177.

[50987] Another function of VGAM1466 is therefore inhibition of LOC96597 (Accession XM_039922). Accordingly, utilities of VGAM1466 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC96597. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1467 (VGAM1467) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[50988] VGAM1467 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1467 was detected is described hereinabove with reference to Figs. 1–8.

[50989] VGAM1467 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 2. VGAM1467 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[50990] VGAM1467 gene encodes a VGAM1467 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1467 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1467 precursor RNA is designated SEQ ID:1453, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:1453 is located at position 40183 relative to the genome of Equine Herpesvirus 2.

[50991] VGAM1467 precursor RNA folds onto itself, forming VGAM1467 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[50992] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1467 folded precursor RNA into VGAM1467 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1467 RNA is designated SEQ ID:4178, and is provided hereinbelow with reference to the sequence listing part.

[50993] VGAM1467 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1467 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1467 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[50994] VGAM1467 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1467 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1467 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1467 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1467 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[50995] The complementary binding of VGAM1467 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1467 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1467 host target RNA into VGAM1467 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[50996] It is appreciated that VGAM1467 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1467 host target genes. The mRNA of each one of this plurality of VGAM1467 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1467 RNA, herein designated VGAM RNA, and which when bound by VGAM1467 RNA causes inhibition of translation of respective one or more

VGAM1467 host target proteins.

[50997] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1467 gene, herein designated VGAM GENE, on one or more VGAM1467 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[50998] It is yet further appreciated that a function of VGAM1467 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1467 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Spe-

cific functions, and accordingly utilities, of VGAM1467 correlate with, and may be deduced from, the identity of the host target genes which VGAM1467 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[50999] Nucleotide sequences of the VGAM1467 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1467 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1467 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1467 are further described hereinbelow with reference to Table 1.

[51000] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1467 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1467 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51001] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1467 gene, herein designated VGAM is inhibition of expression of VGAM1467 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM1467 correlate with, and may be deduced from, the identity of the target genes which VGAM1467 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[51002] BCL2-like 2 (BCL2L2, Accession NM_004050) is a VGAM1467 host target gene. BCL2L2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BCL2L2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL2L2 BINDING SITE, designated SEQ ID:10259, to the nucleotide sequence of VGAM1467 RNA, herein designated VGAM RNA, also designated SEQ ID:4178.

[51003] A function of VGAM1467 is therefore inhibition of BCL2-like 2 (BCL2L2, Accession NM_004050), a gene which promotes cell survival. Accordingly, utilities of VGAM1467 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL2L2. The function of BCL2L2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM431. Cyclin-dependent Kinase 2 (CDK2,

Accession NM_001798) is another VGAM1467 host target gene. CDK2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CDK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDK2 BINDING SITE, designated SEQ ID:7551, to the nucleotide sequence of VGAM1467 RNA, herein designated VGAM RNA, also designated SEQ ID:4178.

[51004] Another function of VGAM1467 is therefore inhibition of Cyclin-dependent Kinase 2 (CDK2, Accession NM_001798), a gene which plays a unique role in cell cycle regulation of vertebrate cells. Accordingly, utilities of VGAM1467 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDK2. The function of CDK2 has been established by previous studies. The complex formed of p34(cdc2) (OMIM Ref. No. 116940) and cyclin B (OMIM Ref. No. 176740) is required for the G2-to-M transition in cell division. Human cyclin A (OMIM Ref. No. 123835) binds independently to 2 kinases, p34(cdc2) or p33. In adenovirus-transformed cells, the viral E1A oncoprotein seems to associate with p33/cyclin A but not with p34(cdc2)/cyclin A. Tsai et al. (1991) isolated

the gene for p33, which shares 65% sequence identity with p34(cdc2). They suggested that p33(cdk2) plays a unique role in cell cycle regulation of vertebrate cells. CDK (e.g., CDK2) activation requires association with cyclins (e.g., CCNE1; 123837) and phosphorylation by CAK (CCNH; 601953), and leads to cell proliferation. Inhibition of cellular proliferation occurs upon association of CDK inhibitor (e.g., CDKN1B; 600778) with a cyclin-CDK complex. Sheaff et al. (1997) showed that expression of CCNE1-CDK2 at physiologic levels of ATP results in phosphorylation of CDKN1B at thr187, leading to elimination of CDKN1B from the cell and progression of the cell cycle from G1 to S phase. At low ATP levels, the inhibitory functions of CDKN1B are enhanced, thereby arresting cell proliferation.

[51005] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[51006] Sheaff, R. J.; Groudine, M.; Gordon, M.; Roberts, J. M.; Clurman, B. E. : Cyclin E-CDK2 is a regulator of p27(Kip1). *Genes Dev.* 11: 1464-1478, 1997. ; and

[51007] Tsai, L.-H.; Harlow, E.; Meyerson, M. : Isolation of the human cdk2 gene that encodes the cyclin A- and adenovirus

E1A-associated p33 kinase. Nature 353: 174–177, 1991.

[51008] Further studies establishing the function and utilities of CDK2 are found in John Hopkins OMIM database record ID 116953, and in cited publications numbered 335, 12055–12056, 159, 1496, 4704, 712 and 4705–368 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Cytochrome P450, Subfamily VIII B (sterol 12- α -hydroxylase), Polypeptide 1 (CYP8B1, Accession NM_004391) is another VGAM1467 host target gene. CYP8B1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CYP8B1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYP8B1 BINDING SITE, designated SEQ ID:10628, to the nucleotide sequence of VGAM1467 RNA, herein designated VGAM RNA, also designated SEQ ID:4178.

[51009] Another function of VGAM1467 is therefore inhibition of Cytochrome P450, Subfamily VIII B (sterol 12- α -hydroxylase), Polypeptide 1 (CYP8B1, Accession NM_004391), a gene which functions in bile acid biosynthesis. Accordingly, utilities of VGAM1467 include diag-

nosis, prevention and treatment of diseases and clinical conditions associated with CYP8B1. The function of CYP8B1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM923. Giant Axonal Neuropathy (gigaxonin) (GAN, Accession NM_022041) is another VGAM1467 host target gene. GAN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GAN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GAN BINDING SITE, designated SEQ ID:22563, to the nucleotide sequence of VGAM1467 RNA, herein designated VGAM RNA, also designated SEQ ID:4178.

[51010] Another function of VGAM1467 is therefore inhibition of Giant Axonal Neuropathy (gigaxonin) (GAN, Accession NM_022041), a gene which plays an important role in neurofilament architecture. Accordingly, utilities of VGAM1467 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAN. The function of GAN and its association with various diseases and clinical conditions, has been established by

previous studies, as described hereinabove with reference to VGAM606.Kinesin Family Member C3 (KIFC3, Accession NM_005550) is another VGAM1467 host target gene.

KIFC3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIFC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIFC3 BINDING SITE, designated SEQ ID:12080, to the nucleotide sequence of VGAM1467 RNA, herein designated VGAM RNA, also designated SEQ ID:4178.

[51011] Another function of VGAM1467 is therefore inhibition of Kinesin Family Member C3 (KIFC3, Accession NM_005550), a gene which may function in intracellular transport and mitosis. Accordingly, utilities of VGAM1467 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIFC3. The function of KIFC3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1006.Nyctalopin (NYX, Accession NM_022567) is another VGAM1467 host target gene. NYX BINDING SITE1 and NYX BINDING SITE2 are HOST TARGET binding sites

found in untranslated regions of mRNA encoded by NYX, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NYX BINDING SITE1 and NYX BINDING SITE2, designated SEQ ID:22887 and SEQ ID:22888 respectively, to the nucleotide sequence of VGAM1467 RNA, herein designated VGAM RNA, also designated SEQ ID:4178.

[51012] Another function of VGAM1467 is therefore inhibition of Nyctalopin (NYX, Accession NM_022567), a gene which functions as the von willebrand factor receptor and mediates von willebrand factor-dependent platelet adhesion to blood vessels. the adhesion of platelets to injured vascular surfaces in the arterial circulation is a critical initiating event in hemostasis (by similarity). Accordingly, utilities of VGAM1467 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NYX. The function of NYX and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM206. Promyelocytic Leukemia (PML, Accession NM_033240) is another VGAM1467 host target gene. PML BINDING SITE1 and PML BINDING SITE2 are HOST TARGET

binding sites found in untranslated regions of mRNA encoded by PML, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PML BINDING SITE1 and PML BINDING SITE2, designated SEQ ID:27082 and SEQ ID:27086 respectively, to the nucleotide sequence of VGAM1467 RNA, herein designated VGAM RNA, also designated SEQ ID:4178.

[51013] Another function of VGAM1467 is therefore inhibition of Promyelocytic Leukemia (PML, Accession NM_033240). Accordingly, utilities of VGAM1467 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PML. Paired Mesoderm Homeo Box 1 (PMX1, Accession NM_006902) is another VGAM1467 host target gene. PMX1 BINDING SITE1 and PMX1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PMX1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PMX1 BINDING SITE1 and PMX1 BINDING SITE2, designated SEQ ID:13778 and SEQ ID:12907 respectively, to the nu-

cleotide sequence of VGAM1467 RNA, herein designated VGAM RNA, also designated SEQ ID:4178.

[51014] Another function of VGAM1467 is therefore inhibition of Paired Mesoderm Homeo Box 1 (PMX1, Accession NM_006902), a gene which acts as a transcriptional regulator of muscle creatine kinase. Accordingly, utilities of VGAM1467 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PMX1. The function of PMX1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM381.FLJ13189 (Accession NM_024882) is another VGAM1467 host target gene. FLJ13189 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ13189, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13189 BINDING SITE, designated SEQ ID:24330, to the nucleotide sequence of VGAM1467 RNA, herein designated VGAM RNA, also designated SEQ ID:4178.

[51015] Another function of VGAM1467 is therefore inhibition of FLJ13189 (Accession NM_024882). Accordingly, utilities of

VGAM1467 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13189. Glycoprotein V (platelet) (GP5, Accession NM_004488) is another VGAM1467 host target gene. GP5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GP5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GP5 BINDING SITE, designated SEQ ID:10815, to the nucleotide sequence of VGAM1467 RNA, herein designated VGAM RNA, also designated SEQ ID:4178.

[51016] Another function of VGAM1467 is therefore inhibition of Glycoprotein V (platelet) (GP5, Accession NM_004488). Accordingly, utilities of VGAM1467 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GP5. Interleukin 1 Family, Member 10 (theta) (IL1F10, Accession NM_032556) is another VGAM1467 host target gene. IL1F10 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by IL1F10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of IL1F10 BINDING SITE, designated SEQ ID:26283, to the nucleotide sequence of VGAM1467 RNA, herein designated VGAM RNA, also designated SEQ ID:4178.

[51017] Another function of VGAM1467 is therefore inhibition of Interleukin 1 Family, Member 10 (theta) (IL1F10, Accession NM_032556). Accordingly, utilities of VGAM1467 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL1F10. KIAA0935 (Accession XM_052620) is another VGAM1467 host target gene. KIAA0935 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0935, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0935 BINDING SITE, designated SEQ ID:36009, to the nucleotide sequence of VGAM1467 RNA, herein designated VGAM RNA, also designated SEQ ID:4178.

[51018] Another function of VGAM1467 is therefore inhibition of KIAA0935 (Accession XM_052620). Accordingly, utilities of VGAM1467 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0935. KIAA1388 (Accession XM_168030) is another VGAM1467 host target gene. KIAA1388 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1388, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1388 BINDING SITE, designated SEQ ID:44951, to the nucleotide sequence of VGAM1467 RNA, herein designated VGAM RNA, also designated SEQ ID:4178.

[51019] Another function of VGAM1467 is therefore inhibition of KIAA1388 (Accession XM_168030). Accordingly, utilities of VGAM1467 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1388. KIAA1674 (Accession XM_044065) is another VGAM1467 host target gene. KIAA1674 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1674, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1674 BINDING SITE, designated SEQ ID:34103, to the nucleotide sequence of VGAM1467 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4178.

[51020] Another function of VGAM1467 is therefore inhibition of KIAA1674 (Accession XM_044065). Accordingly, utilities of VGAM1467 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1674. Neuroblastoma, Suppression of Tumorigenicity 1 (NBL1, Accession XM_001434) is another VGAM1467 host target gene. NBL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NBL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NBL1 BINDING SITE, designated SEQ ID:29837, to the nucleotide sequence of VGAM1467 RNA, herein designated VGAM RNA, also designated SEQ ID:4178.

[51021] Another function of VGAM1467 is therefore inhibition of Neuroblastoma, Suppression of Tumorigenicity 1 (NBL1, Accession XM_001434). Accordingly, utilities of VGAM1467 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NBL1. Nei Like 2 (E. coli) (NEIL2, Accession NM_145043) is another VGAM1467 host target gene. NEIL2 BINDING SITE is

HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by NEIL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NEIL2 BINDING SITE, designated SEQ ID:29672, to the nucleotide sequence of VGAM1467 RNA, herein designated VGAM RNA, also designated SEQ ID:4178.

[51022] Another function of VGAM1467 is therefore inhibition of Nei Like 2 (E. coli) (NEIL2, Accession NM_145043). Accordingly, utilities of VGAM1467 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NEIL2. PTK6 Protein Tyrosine Kinase 6 (PTK6, Accession NM_005975) is another VGAM1467 host target gene. PTK6 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PTK6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTK6 BINDING SITE, designated SEQ ID:12600, to the nucleotide sequence of VGAM1467 RNA, herein designated VGAM RNA, also designated SEQ ID:4178.

[51023] Another function of VGAM1467 is therefore inhibition of PTK6 Protein Tyrosine Kinase 6 (PTK6, Accession NM_005975). Accordingly, utilities of VGAM1467 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTK6. RAB3A Interacting Protein (rabin3)-like 1 (RAB3IL1, Accession NM_013401) is another VGAM1467 host target gene. RAB3IL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAB3IL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB3IL1 BINDING SITE, designated SEQ ID:15061, to the nucleotide sequence of VGAM1467 RNA, herein designated VGAM RNA, also designated SEQ ID:4178.

[51024] Another function of VGAM1467 is therefore inhibition of RAB3A Interacting Protein (rabin3)-like 1 (RAB3IL1, Accession NM_013401). Accordingly, utilities of VGAM1467 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB3IL1. SEC24 Related Gene Family, Member A (*S. cerevisiae*) (SEC24A, Accession XM_094581) is another VGAM1467 host target gene. SEC24A BINDING SITE is HOST TARGET binding site found

in the 5' untranslated region of mRNA encoded by SEC24A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEC24A BINDING SITE, designated SEQ ID:40234, to the nucleotide sequence of VGAM1467 RNA, herein designated VGAM RNA, also designated SEQ ID:4178.

[51025] Another function of VGAM1467 is therefore inhibition of SEC24 Related Gene Family, Member A (*S. cerevisiae*) (SEC24A, Accession XM_094581). Accordingly, utilities of VGAM1467 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEC24A. Solute Carrier Family 1 (glutamate transporter), Member 7 (SLC1A7, Accession NM_006671) is another VGAM1467 host target gene. SLC1A7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC1A7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC1A7 BINDING SITE, designated SEQ ID:13488, to the nucleotide sequence of VGAM1467 RNA, herein designated VGAM

RNA, also designated SEQ ID:4178.

[51026] Another function of VGAM1467 is therefore inhibition of Solute Carrier Family 1 (glutamate transporter), Member 7 (SLC1A7, Accession NM_006671). Accordingly, utilities of VGAM1467 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC1A7. STRAIT11499 (Accession NM_021242) is another VGAM1467 host target gene. STRAIT11499 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by STRAIT11499, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STRAIT11499 BINDING SITE, designated SEQ ID:22208, to the nucleotide sequence of VGAM1467 RNA, herein designated VGAM RNA, also designated SEQ ID:4178.

[51027] Another function of VGAM1467 is therefore inhibition of STRAIT11499 (Accession NM_021242). Accordingly, utilities of VGAM1467 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STRAIT11499. LOC145988 (Accession XM_085290) is another VGAM1467 host target gene. LOC145988 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC145988, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145988 BINDING SITE, designated SEQ ID:38035, to the nucleotide sequence of VGAM1467 RNA, herein designated VGAM RNA, also designated SEQ ID:4178.

[51028] Another function of VGAM1467 is therefore inhibition of LOC145988 (Accession XM_085290). Accordingly, utilities of VGAM1467 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145988. LOC148529 (Accession XM_097481) is another VGAM1467 host target gene. LOC148529 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148529, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148529 BINDING SITE, designated SEQ ID:40889, to the nucleotide sequence of VGAM1467 RNA, herein designated VGAM RNA, also designated SEQ ID:4178.

[51029] Another function of VGAM1467 is therefore inhibition of LOC148529 (Accession XM_097481). Accordingly, utilities

of VGAM1467 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148529. LOC150407 (Accession XM_086906) is another VGAM1467 host target gene. LOC150407 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150407, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150407 BINDING SITE, designated SEQ ID:38951, to the nucleotide sequence of VGAM1467 RNA, herein designated VGAM RNA, also designated SEQ ID:4178.

[51030] Another function of VGAM1467 is therefore inhibition of LOC150407 (Accession XM_086906). Accordingly, utilities of VGAM1467 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150407. LOC157567 (Accession XM_088328) is another VGAM1467 host target gene. LOC157567 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC157567, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC157567 BINDING SITE, designated SEQ ID:39613, to the nucleotide sequence of VGAM1467 RNA, herein designated VGAM RNA, also designated SEQ ID:4178.

[51031] Another function of VGAM1467 is therefore inhibition of LOC157567 (Accession XM_088328). Accordingly, utilities of VGAM1467 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157567. LOC159121 (Accession XM_099028) is another VGAM1467 host target gene. LOC159121 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC159121, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC159121 BINDING SITE, designated SEQ ID:42064, to the nucleotide sequence of VGAM1467 RNA, herein designated VGAM RNA, also designated SEQ ID:4178.

[51032] Another function of VGAM1467 is therefore inhibition of LOC159121 (Accession XM_099028). Accordingly, utilities of VGAM1467 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC159121. LOC196812 (Accession XM_116868) is another VGAM1467 host target gene. LOC196812 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196812, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196812 BINDING SITE, designated SEQ ID:43137, to the nucleotide sequence of VGAM1467 RNA, herein designated VGAM RNA, also designated SEQ ID:4178.

[51033] Another function of VGAM1467 is therefore inhibition of LOC196812 (Accession XM_116868). Accordingly, utilities of VGAM1467 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196812. LOC199923 (Accession XM_114057) is another VGAM1467 host target gene. LOC199923 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC199923, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199923 BINDING SITE, designated SEQ ID:42666, to the nucleotide sequence of VGAM1467 RNA, herein designated VGAM RNA, also designated SEQ ID:4178.

[51034] Another function of VGAM1467 is therefore inhibition of

LOC199923 (Accession XM_114057). Accordingly, utilities of VGAM1467 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199923. LOC92465 (Accession XM_045250) is another VGAM1467 host target gene. LOC92465 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92465, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92465 BINDING SITE, designated SEQ ID:34391, to the nucleotide sequence of VGAM1467 RNA, herein designated VGAM RNA, also designated SEQ ID:4178.

[51035] Another function of VGAM1467 is therefore inhibition of LOC92465 (Accession XM_045250). Accordingly, utilities of VGAM1467 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92465. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1468 (VGAM1468) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[51036] VGAM1468 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1468 was detected is described hereinabove with reference to Figs. 1–8.

[51037] VGAM1468 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Infectious Flacherie Virus. VGAM1468 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51038] VGAM1468 gene encodes a VGAM1468 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1468 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1468 precursor RNA is designated SEQ ID:1454, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1454 is located at position 4200 relative to the genome of Infectious Flacherie Virus.

[51039] VGAM1468 precursor RNA folds onto itself, forming VGAM1468 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two–

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51040] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1468 folded precursor RNA into VGAM1468 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1468 RNA is designated SEQ ID:4179, and is provided hereinbelow with reference to the sequence listing part.

[51041] VGAM1468 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1468 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1468 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[51042] VGAM1468 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1468 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1468 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1468 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1468 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[51043] The complementary binding of VGAM1468 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1468 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1468 host target RNA into VGAM1468 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51044] It is appreciated that VGAM1468 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1468 host target genes. The mRNA of each one of this plurality of VGAM1468 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1468 RNA, herein designated VGAM RNA, and which when bound by VGAM1468 RNA causes inhibition of translation of respective one or more VGAM1468 host target proteins.

[51045] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1468 gene, herein designated VGAM GENE, on one

or more VGAM1468 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[51046] It is yet further appreciated that a function of VGAM1468 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1468 include diagnosis, prevention and treatment of viral infection by Infectious Flacherie Virus. Specific functions, and accordingly utilities, of VGAM1468 correlate with, and may be deduced from, the identity of the host target genes which VGAM1468 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51047] Nucleotide sequences of the VGAM1468 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1468 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1468 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1468 are further described hereinbelow with reference to Table 1.

[51048] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1468 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1468 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51049] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1468 gene, herein designated VGAM is inhibition of expression of VGAM1468 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1468 correlate with, and may be deduced from, the identity of the target genes which VGAM1468 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[51050] Ankyrin Repeat Domain 6 (ANKRD6, Accession

NM_014942) is a VGAM1468 host target gene. ANKRD6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ANKRD6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ANKRD6 BINDING SITE, designated SEQ ID:17251, to the nucleotide sequence of VGAM1468 RNA, herein designated VGAM RNA, also designated SEQ ID:4179.

[51051] A function of VGAM1468 is therefore inhibition of Ankyrin Repeat Domain 6 (ANKRD6, Accession NM_014942). Accordingly, utilities of VGAM1468 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANKRD6. FLJ10853 (Accession NM_018246) is another VGAM1468 host target gene. FLJ10853 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10853, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10853 BINDING SITE, designated SEQ ID:20212, to the nucleotide sequence of VGAM1468 RNA,

herein designated VGAM RNA, also designated SEQ ID:4179.

[51052] Another function of VGAM1468 is therefore inhibition of FLJ10853 (Accession NM_018246). Accordingly, utilities of VGAM1468 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10853. FLJ22625 (Accession NM_024715) is another VGAM1468 host target gene. FLJ22625 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22625, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22625 BINDING SITE, designated SEQ ID:24040, to the nucleotide sequence of VGAM1468 RNA, herein designated VGAM RNA, also designated SEQ ID:4179.

[51053] Another function of VGAM1468 is therefore inhibition of FLJ22625 (Accession NM_024715). Accordingly, utilities of VGAM1468 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22625. KIAA0446 (Accession XM_044155) is another VGAM1468 host target gene. KIAA0446 BINDING SITE is HOST TARGET binding site found in the 5' untranslated

region of mRNA encoded by KIAA0446, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0446 BINDING SITE, designated SEQ ID:34152, to the nucleotide sequence of VGAM1468 RNA, herein designated VGAM RNA, also designated SEQ ID:4179.

[51054] Another function of VGAM1468 is therefore inhibition of KIAA0446 (Accession XM_044155). Accordingly, utilities of VGAM1468 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0446. LOC126964 (Accession XM_059100) is another VGAM1468 host target gene. LOC126964 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC126964, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126964 BINDING SITE, designated SEQ ID:36881, to the nucleotide sequence of VGAM1468 RNA, herein designated VGAM RNA, also designated SEQ ID:4179.

[51055] Another function of VGAM1468 is therefore inhibition of LOC126964 (Accession XM_059100). Accordingly, utilities

of VGAM1468 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126964. LOC158476 (Accession XM_098955) is another VGAM1468 host target gene. LOC158476 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158476, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158476 BINDING SITE, designated SEQ ID:41994, to the nucleotide sequence of VGAM1468 RNA, herein designated VGAM RNA, also designated SEQ ID:4179.

[51056] Another function of VGAM1468 is therefore inhibition of LOC158476 (Accession XM_098955). Accordingly, utilities of VGAM1468 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158476. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1469 (VGAM1469) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51057] VGAM1469 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1469 was detected is described hereinabove with reference to Figs. 1-8.

[51058] VGAM1469 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Infectious Flacherie Virus. VGAM1469 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51059] VGAM1469 gene encodes a VGAM1469 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1469 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1469 precursor RNA is designated SEQ ID:1455, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1455 is located at position 916 relative to the genome of Infectious Flacherie Virus.

[51060] VGAM1469 precursor RNA folds onto itself, forming VGAM1469 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51061] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1469 folded precursor RNA into VGAM1469 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of VGAM1469 RNA is designated SEQ ID:4180, and is provided hereinbelow with reference to the sequence listing part.

[51062] VGAM1469 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1469 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1469 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[51063] VGAM1469 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1469 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1469 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1469 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1469 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[51064] The complementary binding of VGAM1469 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1469 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1469 host target RNA into VGAM1469 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51065] It is appreciated that VGAM1469 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1469 host target genes. The mRNA of each one of this plurality of VGAM1469 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1469 RNA, herein designated VGAM RNA, and which when bound by VGAM1469 RNA causes inhibition of translation of respective one or more VGAM1469 host target proteins.

[51066] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1469 gene, herein designated VGAM GENE, on one or more VGAM1469 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[51067] It is yet further appreciated that a function of VGAM1469 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1469 include diagnosis, prevention and treatment of viral infection by Infectious Flacherie Virus. Specific functions, and accordingly utilities, of VGAM1469 correlate with, and may be deduced from, the identity of the host target genes which VGAM1469 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51068] Nucleotide sequences of the VGAM1469 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the
`diced` VGAM1469 RNA, herein designated VGAM RNA,
and a schematic representation of the secondary folding
of VGAM1469 folded precursor RNA, herein designated
VGAM FOLDED PRECURSOR RNA, of VGAM1469 are further
described hereinbelow with reference to Table 1.

[51069] Nucleotide sequences of host target binding sites, such as
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of
Fig. 1, found on VGAM1469 host target RNA, and
schematic representation of the complementarity of each
of these host target binding sites to VGAM1469 RNA,
herein designated VGAM RNA, are described hereinbelow
with reference to Table 2.

[51070] As mentioned hereinabove with reference to Fig. 1, a
function of VGAM1469 gene, herein designated VGAM is
inhibition of expression of VGAM1469 target genes. It is
appreciated that specific functions, and accordingly utili-
ties, of VGAM1469 correlate with, and may be deduced
from, the identity of the target genes which VGAM1469
binds and inhibits, and the function of these target genes,
as elaborated hereinbelow.

[51071] Vacuolar Protein Sorting 41 (yeast) (VPS41, Accession
NM_014396) is a VGAM1469 host target gene. VPS41

BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by VPS41, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VPS41 BINDING SITE, designated SEQ ID:15735, to the nucleotide sequence of VGAM1469 RNA, herein designated VGAM RNA, also designated SEQ ID:4180.

[51072] A function of VGAM1469 is therefore inhibition of Vacuolar Protein Sorting 41 (yeast) (VPS41, Accession NM_014396). Accordingly, utilities of VGAM1469 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VPS41. DKFZp547I224 (Accession NM_020221) is another VGAM1469 host target gene. DKFZp547I224 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp547I224, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp547I224 BINDING SITE, designated SEQ ID:21472, to the nucleotide sequence of VGAM1469 RNA, herein designated VGAM RNA, also designated SEQ ID:4180.

[51073] Another function of VGAM1469 is therefore inhibition of DKFZp547I224 (Accession NM_020221). Accordingly, utilities of VGAM1469 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547I224. KIAA0916 (Accession NM_015057) is another VGAM1469 host target gene. KIAA0916 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0916, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0916 BINDING SITE, designated SEQ ID:17415, to the nucleotide sequence of VGAM1469 RNA, herein designated VGAM RNA, also designated SEQ ID:4180.

[51074] Another function of VGAM1469 is therefore inhibition of KIAA0916 (Accession NM_015057). Accordingly, utilities of VGAM1469 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0916. PAI-RBP1 (Accession NM_015640) is another VGAM1469 host target gene. PAI-RBP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PAI-RBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAI-RBP1 BINDING SITE, designated SEQ ID:17892, to the nucleotide sequence of VGAM1469 RNA, herein designated VGAM RNA, also designated SEQ ID:4180.

[51075] Another function of VGAM1469 is therefore inhibition of PAI-RBP1 (Accession NM_015640). Accordingly, utilities of VGAM1469 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAI-RBP1. PRO1992 (Accession NM_014107) is another VGAM1469 host target gene. PRO1992 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRO1992, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1992 BINDING SITE, designated SEQ ID:15332, to the nucleotide sequence of VGAM1469 RNA, herein designated VGAM RNA, also designated SEQ ID:4180.

[51076] Another function of VGAM1469 is therefore inhibition of PRO1992 (Accession NM_014107). Accordingly, utilities of VGAM1469 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

PRO1992. LOC112476 (Accession NM_145239) is another VGAM1469 host target gene. LOC112476 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC112476, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC112476 BINDING SITE, designated SEQ ID:29750, to the nucleotide sequence of VGAM1469 RNA, herein designated VGAM RNA, also designated SEQ ID:4180.

[51077] Another function of VGAM1469 is therefore inhibition of LOC112476 (Accession NM_145239). Accordingly, utilities of VGAM1469 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC112476. LOC147219 (Accession XM_097214) is another VGAM1469 host target gene. LOC147219 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147219, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147219 BINDING SITE, designated SEQ ID:40822, to the nucleotide sequence of VGAM1469 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4180.

[51078] Another function of VGAM1469 is therefore inhibition of LOC147219 (Accession XM_097214). Accordingly, utilities of VGAM1469 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147219. LOC150139 (Accession XM_086794) is another VGAM1469 host target gene. LOC150139 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150139, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150139 BINDING SITE, designated SEQ ID:38856, to the nucleotide sequence of VGAM1469 RNA, herein designated VGAM RNA, also designated SEQ ID:4180.

[51079] Another function of VGAM1469 is therefore inhibition of LOC150139 (Accession XM_086794). Accordingly, utilities of VGAM1469 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150139. LOC150157 (Accession XM_097823) is another VGAM1469 host target gene. LOC150157 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150157, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150157 BINDING SITE, designated SEQ ID:41139, to the nucleotide sequence of VGAM1469 RNA, herein designated VGAM RNA, also designated SEQ ID:4180.

[51080] Another function of VGAM1469 is therefore inhibition of LOC150157 (Accession XM_097823). Accordingly, utilities of VGAM1469 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150157. LOC152502 (Accession XM_001389) is another VGAM1469 host target gene. LOC152502 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152502, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152502 BINDING SITE, designated SEQ ID:29834, to the nucleotide sequence of VGAM1469 RNA, herein designated VGAM RNA, also designated SEQ ID:4180.

[51081] Another function of VGAM1469 is therefore inhibition of LOC152502 (Accession XM_001389). Accordingly, utilities of VGAM1469 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC152502. LOC196890 (Accession XM_116951) is another VGAM1469 host target gene. LOC196890 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196890, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196890 BINDING SITE, designated SEQ ID:43154, to the nucleotide sequence of VGAM1469 RNA, herein designated VGAM RNA, also designated SEQ ID:4180.

[51082] Another function of VGAM1469 is therefore inhibition of LOC196890 (Accession XM_116951). Accordingly, utilities of VGAM1469 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196890. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1470 (VGAM1470) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51083] VGAM1470 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1470 was detected is described hereinabove with reference to Figs. 1–8.

[51084] VGAM1470 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cocksfoot Streak Virus (CSV). VGAM1470 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51085] VGAM1470 gene encodes a VGAM1470 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1470 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1470 precursor RNA is designated SEQ ID:1456, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1456 is located at position 5947 relative to the genome of Cocksfoot Streak Virus (CSV).

[51086] VGAM1470 precursor RNA folds onto itself, forming VGAM1470 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51087] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1470 folded precursor RNA into VGAM1470 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1470 RNA is designated SEQ ID:4181, and is provided hereinbelow with reference to the sequence listing part.

[51088] VGAM1470 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1470 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1470 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[51089] VGAM1470 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1470 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1470 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1470 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1470 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[51090] The complementary binding of VGAM1470 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1470 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1470 host target RNA into VGAM1470 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51091] It is appreciated that VGAM1470 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1470 host target genes. The mRNA of each one of this plurality of VGAM1470 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1470 RNA, herein designated VGAM RNA, and which when bound by VGAM1470 RNA causes inhibition of translation of respective one or more VGAM1470 host target proteins.

[51092] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1470 gene, herein designated VGAM GENE, on one or more VGAM1470 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[51093] It is yet further appreciated that a function of VGAM1470 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1470 include diagnosis, prevention and treatment of viral infection by Cocksfoot Streak Virus (CSV). Specific functions, and accordingly utilities, of VGAM1470 correlate with, and may be deduced from, the identity of the host target genes which VGAM1470 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51094] Nucleotide sequences of the VGAM1470 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM1470 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1470 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1470 are further described hereinbelow with reference to Table 1.

[51095] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1470 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1470 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51096] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1470 gene, herein designated VGAM is inhibition of expression of VGAM1470 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1470 correlate with, and may be deduced from, the identity of the target genes which VGAM1470 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[51097] Fms-related Tyrosine Kinase 1 (vascular endothelial growth factor/vascular permeability factor receptor) (FLT1, Accession NM_002019) is a VGAM1470 host target gene.

FLT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLT1 BINDING SITE, designated SEQ ID:7764, to the nucleotide sequence of VGAM1470 RNA, herein designated VGAM RNA, also designated SEQ ID:4181.

[51098] A function of VGAM1470 is therefore inhibition of Fms-related Tyrosine Kinase 1 (vascular endothelial growth factor/vascular permeability factor receptor) (FLT1, Accession NM_002019). Accordingly, utilities of VGAM1470 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLT1. Transcriptional Intermediary Factor 1 (TIF1, Accession XM_016701) is another VGAM1470 host target gene. TIF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TIF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIF1 BINDING SITE, designated SEQ ID:30275, to the nucleotide sequence of VGAM1470 RNA, herein designated VGAM RNA,

also designated SEQ ID:4181.

[51099] Another function of VGAM1470 is therefore inhibition of Transcriptional Intermediary Factor 1 (TIF1, Accession XM_016701), a gene which mediates the activation function (AF-2) of nuclear estrogen receptor. Accordingly, utilities of VGAM1470 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIF1. The function of TIF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM108.FLJ14600 (Accession NM_032810) is another VGAM1470 host target gene. FLJ14600 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14600, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14600 BINDING SITE, designated SEQ ID:26575, to the nucleotide sequence of VGAM1470 RNA, herein designated VGAM RNA, also designated SEQ ID:4181.

[51100] Another function of VGAM1470 is therefore inhibition of FLJ14600 (Accession NM_032810). Accordingly, utilities of VGAM1470 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ14600. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1471 (VGAM1471) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51101] VGAM1471 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1471 was detected is described hereinabove with reference to Figs. 1–8.

[51102] VGAM1471 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cocksfoot Streak Virus (CSV). VGAM1471 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51103] VGAM1471 gene encodes a VGAM1471 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1471 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1471 precursor RNA is desig-

nated SEQ ID:1457, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1457 is located at position 4782 relative to the genome of Cocksfoot Streak Virus (CSV).

- [51104] VGAM1471 precursor RNA folds onto itself, forming VGAM1471 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [51105] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1471 folded precursor RNA into VGAM1471 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1471 RNA is designated SEQ ID:4182, and is provided hereinbelow with reference to the sequence

listing part.

[51106] VGAM1471 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1471 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1471 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[51107] VGAM1471 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1471 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1471 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1471 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM1471 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[51108] The complementary binding of VGAM1471 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1471 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1471 host target RNA into VGAM1471 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51109] It is appreciated that VGAM1471 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1471 host target genes. The mRNA of each one of this plurality of VGAM1471 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1471 RNA, herein designated VGAM

RNA, and which when bound by VGAM1471 RNA causes inhibition of translation of respective one or more VGAM1471 host target proteins.

[51110] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1471 gene, herein designated VGAM GENE, on one or more VGAM1471 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[51111] It is yet further appreciated that a function of VGAM1471 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1471 include diagnosis, prevention and treatment of viral infection by Cocksfoot Streak Virus (CSV). Specific functions, and accordingly utilities, of VGAM1471 correlate with, and may be deduced from, the identity of the host target genes which VGAM1471 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51112] Nucleotide sequences of the VGAM1471 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1471 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1471 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1471 are further described hereinbelow with reference to Table 1.

[51113] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1471 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1471 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51114] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1471 gene, herein designated VGAM is

inhibition of expression of VGAM1471 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1471 correlate with, and may be deduced from, the identity of the target genes which VGAM1471 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[51115] Nuclear Factor of Activated T-cells, Cytoplasmic, Calcineurin-dependent 1 (NFATC1, Accession NM_006162) is a VGAM1471 host target gene. NFATC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NFATC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NFATC1 BINDING SITE, designated SEQ ID:12814, to the nucleotide sequence of VGAM1471 RNA, herein designated VGAM RNA, also designated SEQ ID:4182.

[51116] A function of VGAM1471 is therefore inhibition of Nuclear Factor of Activated T-cells, Cytoplasmic, Calcineurin-dependent 1 (NFATC1, Accession NM_006162), a gene which regulates the activation, proliferation, differentiation and programmed death of lymphoid and nonlymphoid cells. Accordingly, utilities of VGAM1471 include diagnosis,

prevention and treatment of diseases and clinical conditions associated with NFATC1. The function of NFATC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM123.BTB (POZ) Domain Containing 3 (BTBD3, Accession NM_014962) is another VGAM1471 host target gene. BTBD3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BTBD3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BTBD3 BINDING SITE, designated SEQ ID:17337, to the nucleotide sequence of VGAM1471 RNA, herein designated VGAM RNA, also designated SEQ ID:4182.

[51117] Another function of VGAM1471 is therefore inhibition of BTB (POZ) Domain Containing 3 (BTBD3, Accession NM_014962). Accordingly, utilities of VGAM1471 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BTBD3. DKFZp761N0624 (Accession NM_032295) is another VGAM1471 host target gene. DKFZp761N0624 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by DKFZp761N0624, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761N0624 BINDING SITE, designated SEQ ID:26074, to the nucleotide sequence of VGAM1471 RNA, herein designated VGAM RNA, also designated SEQ ID:4182.

[51118] Another function of VGAM1471 is therefore inhibition of DKFZp761N0624 (Accession NM_032295). Accordingly, utilities of VGAM1471 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761N0624. FLJ21709 (Accession XM_085480) is another VGAM1471 host target gene. FLJ21709 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21709, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21709 BINDING SITE, designated SEQ ID:38169, to the nucleotide sequence of VGAM1471 RNA, herein designated VGAM RNA, also designated SEQ ID:4182.

[51119] Another function of VGAM1471 is therefore inhibition of FLJ21709 (Accession XM_085480). Accordingly, utilities of

VGAM1471 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21709. GTP Binding Protein 5 (putative) (GTPBP5, Accession XM_037206) is another VGAM1471 host target gene. GTPBP5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GTPBP5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GTPBP5 BINDING SITE, designated SEQ ID:32574, to the nucleotide sequence of VGAM1471 RNA, herein designated VGAM RNA, also designated SEQ ID:4182.

[51120] Another function of VGAM1471 is therefore inhibition of GTP Binding Protein 5 (putative) (GTPBP5, Accession XM_037206). Accordingly, utilities of VGAM1471 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GTPBP5. MGC21675 (Accession NM_052861) is another VGAM1471 host target gene. MGC21675 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC21675, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC21675 BINDING SITE, designated SEQ ID:27444, to the nucleotide sequence of VGAM1471 RNA, herein designated VGAM RNA, also designated SEQ ID:4182.

[51121] Another function of VGAM1471 is therefore inhibition of MGC21675 (Accession NM_052861). Accordingly, utilities of VGAM1471 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC21675. U5-100K (Accession XM_006784) is another VGAM1471 host target gene. U5-100K BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by U5-100K, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of U5-100K BINDING SITE, designated SEQ ID:30011, to the nucleotide sequence of VGAM1471 RNA, herein designated VGAM RNA, also designated SEQ ID:4182.

[51122] Another function of VGAM1471 is therefore inhibition of U5-100K (Accession XM_006784). Accordingly, utilities of VGAM1471 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

U5-100K. LOC150407 (Accession XM_086906) is another VGAM1471 host target gene. LOC150407 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150407, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150407 BINDING SITE, designated SEQ ID:38954, to the nucleotide sequence of VGAM1471 RNA, herein designated VGAM RNA, also designated SEQ ID:4182.

[51123] Another function of VGAM1471 is therefore inhibition of LOC150407 (Accession XM_086906). Accordingly, utilities of VGAM1471 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150407. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1472 (VGAM1472) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51124] VGAM1472 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1472 was detected is described hereinabove with reference to Figs. 1–8.

[51125] VGAM1472 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cocksfoot Streak Virus (CSV). VGAM1472 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51126] VGAM1472 gene encodes a VGAM1472 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1472 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1472 precursor RNA is designated SEQ ID:1458, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1458 is located at position 4423 relative to the genome of Cocksfoot Streak Virus (CSV).

[51127] VGAM1472 precursor RNA folds onto itself, forming VGAM1472 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide

sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51128] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1472 folded precursor RNA into VGAM1472 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1472 RNA is designated SEQ ID:4183, and is provided hereinbelow with reference to the sequence listing part.

[51129] VGAM1472 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1472 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1472 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[51130] VGAM1472 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1472 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1472 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1472 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1472 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[51131] The complementary binding of VGAM1472 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1472 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1472 host target RNA into VGAM1472 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51132] It is appreciated that VGAM1472 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1472 host target genes. The mRNA of each one of this plurality of VGAM1472 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1472 RNA, herein designated VGAM RNA, and which when bound by VGAM1472 RNA causes inhibition of translation of respective one or more VGAM1472 host target proteins.

[51133] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1472 gene, herein designated VGAM GENE, on one or more VGAM1472 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[51134] It is yet further appreciated that a function of VGAM1472 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1472 include diagnosis, prevention and treatment of viral infection by Cocksfoot Streak Virus (CSV). Specific functions, and accordingly utilities, of VGAM1472 correlate with, and may be deduced from, the identity of the host target genes which VGAM1472 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51135] Nucleotide sequences of the VGAM1472 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1472 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM1472 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1472 are further described hereinbelow with reference to Table 1.

[51136] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1472 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1472 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51137] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1472 gene, herein designated VGAM is inhibition of expression of VGAM1472 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1472 correlate with, and may be deduced from, the identity of the target genes which VGAM1472 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[51138] Protein Kinase, CAMP-dependent, Catalytic, Beta (PRKACB, Accession NM_002731) is a VGAM1472 host target gene. PRKACB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

PRKACB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRKACB BINDING SITE, designated SEQ ID:8602, to the nucleotide sequence of VGAM1472 RNA, herein designated VGAM RNA, also designated SEQ ID:4183.

[51139] A function of VGAM1472 is therefore inhibition of Protein Kinase, CAMP-dependent, Catalytic, Beta (PRKACB, Accession NM_002731), a gene which is the catalytic beta subunit of cAMP-dependent protein kinase (PKA). Accordingly, utilities of VGAM1472 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKACB. The function of PRKACB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM795. Spondyloepiphyseal Dysplasia, Late (SEDL, Accession NM_014563) is another VGAM1472 host target gene. SEDL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEDL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of SEDL BINDING SITE, designated SEQ ID:15909, to the nucleotide sequence of VGAM1472 RNA, herein designated VGAM RNA, also designated SEQ ID:4183.

[51140] Another function of VGAM1472 is therefore inhibition of Spondyloepiphyseal Dysplasia, Late (SEDL, Accession NM_014563), a gene which may play role in vesicular transport from endoplasmic reticulum to golgi. Accordingly, utilities of VGAM1472 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEDL. The function of SEDL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74.Solute Carrier Family 35 (CMP-sialic acid transporter), Member 1 (SLC35A1, Accession NM_006416) is another VGAM1472 host target gene. SLC35A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC35A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC35A1 BINDING SITE, designated SEQ ID:13127, to the nucleotide sequence of VGAM1472 RNA,

herein designated VGAM RNA, also designated SEQ ID:4183.

[51141] Another function of VGAM1472 is therefore inhibition of Solute Carrier Family 35 (CMP-sialic acid transporter), Member 1 (SLC35A1, Accession NM_006416), a gene which transports cmp-sialic acid from the cytosol into golgi vesicles. Accordingly, utilities of VGAM1472 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC35A1. The function of SLC35A1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM152. Steroid-5-alpha-reductase, Alpha Polypeptide 1 (3-oxo-5 alpha-steroid delta 4-dehydrogenase alpha 1) (SRD5A1, Accession NM_001047) is another VGAM1472 host target gene. SRD5A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SRD5A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SRD5A1 BINDING SITE, designated SEQ ID:6716, to the nucleotide sequence of VGAM1472 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4183.

[51142] Another function of VGAM1472 is therefore inhibition of Steroid-5-alpha-reductase, Alpha Polypeptide 1 (3-oxo-5 alpha-steroid delta 4-dehydrogenase alpha 1) (SRD5A1, Accession NM_001047), a gene which catalyzes the conversion of testosterone into 5-alpha-dihydrotestosterone and progesterone . Accordingly, utilities of VGAM1472 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SRD5A1. The function of SRD5A1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM749.ADMP (Accession NM_145035) is another VGAM1472 host target gene. ADMP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADMP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADMP BINDING SITE, designated SEQ ID:29657, to the nucleotide sequence of VGAM1472 RNA, herein designated VGAM RNA, also designated SEQ ID:4183.

[51143] Another function of VGAM1472 is therefore inhibition of

ADMP (Accession NM_145035). Accordingly, utilities of VGAM1472 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADMP. KIAA0872 (Accession NM_014940) is another VGAM1472 host target gene. KIAA0872 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0872, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0872 BINDING SITE, designated SEQ ID:17246, to the nucleotide sequence of VGAM1472 RNA, herein designated VGAM RNA, also designated SEQ ID:4183.

[51144] Another function of VGAM1472 is therefore inhibition of KIAA0872 (Accession NM_014940). Accordingly, utilities of VGAM1472 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0872. LOC148137 (Accession NM_144692) is another VGAM1472 host target gene. LOC148137 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148137, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC148137 BINDING SITE, designated SEQ ID:29516, to the nucleotide sequence of VGAM1472 RNA, herein designated VGAM RNA, also designated SEQ ID:4183.

[51145] Another function of VGAM1472 is therefore inhibition of LOC148137 (Accession NM_144692). Accordingly, utilities of VGAM1472 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148137. LOC162333 (Accession XM_102591) is another VGAM1472 host target gene. LOC162333 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC162333, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC162333 BINDING SITE, designated SEQ ID:42127, to the nucleotide sequence of VGAM1472 RNA, herein designated VGAM RNA, also designated SEQ ID:4183.

[51146] Another function of VGAM1472 is therefore inhibition of LOC162333 (Accession XM_102591). Accordingly, utilities of VGAM1472 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC162333. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1473 (VGAM1473) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51147] VGAM1473 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1473 was detected is described hereinabove with reference to Figs. 1–8.

[51148] VGAM1473 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cocksfoot Streak Virus (CSV). VGAM1473 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51149] VGAM1473 gene encodes a VGAM1473 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1473 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1473 precursor RNA is designated SEQ ID:1459, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:1459 is located at position 8361 relative to the genome of Cocksfoot Streak Virus (CSV).

[51150] VGAM1473 precursor RNA folds onto itself, forming VGAM1473 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51151] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1473 folded precursor RNA into VGAM1473 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide sequence of VGAM1473 RNA is designated SEQ ID:4184, and is provided hereinbelow with reference to the sequence listing part.

[51152] VGAM1473 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1473 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1473 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[51153] VGAM1473 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1473 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1473 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1473 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1473 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[51154] The complementary binding of VGAM1473 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1473 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1473 host target RNA into VGAM1473 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51155] It is appreciated that VGAM1473 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1473 host target genes. The mRNA of each one of this plurality of VGAM1473 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1473 RNA, herein designated VGAM RNA, and which when bound by VGAM1473 RNA causes inhibition of translation of respective one or more

VGAM1473 host target proteins.

[51156] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1473 gene, herein designated VGAM GENE, on one or more VGAM1473 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[51157] It is yet further appreciated that a function of VGAM1473 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1473 include diagnosis, prevention and treatment of viral infection by Cocksfoot Streak Virus

(CSV). Specific functions, and accordingly utilities, of VGAM1473 correlate with, and may be deduced from, the identity of the host target genes which VGAM1473 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51158] Nucleotide sequences of the VGAM1473 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1473 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1473 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1473 are further described hereinbelow with reference to Table 1.

[51159] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1473 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1473 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51160] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1473 gene, herein designated VGAM is inhibition of expression of VGAM1473 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM1473 correlate with, and may be deduced from, the identity of the target genes which VGAM1473 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[51161] FLJ20345 (Accession NM_017777) is a VGAM1473 host target gene. FLJ20345 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20345, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20345 BINDING SITE, designated SEQ ID:19407, to the nucleotide sequence of VGAM1473 RNA, herein designated VGAM RNA, also designated SEQ ID:4184.

[51162] A function of VGAM1473 is therefore inhibition of FLJ20345 (Accession NM_017777). Accordingly, utilities of VGAM1473 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20345. FYVE and Coiled-coil Domain Containing 1 (FYCO1, Accession NM_024513) is another VGAM1473 host target gene. FYCO1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FYCO1, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FYCO1 BINDING SITE, designated SEQ ID:23711, to the nucleotide sequence of VGAM1473 RNA, herein designated VGAM RNA, also designated SEQ ID:4184.

[51163] Another function of VGAM1473 is therefore inhibition of FYVE and Coiled-coil Domain Containing 1 (FYCO1, Accession NM_024513). Accordingly, utilities of VGAM1473 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FYCO1. KIAA1061 (Accession XM_048786) is another VGAM1473 host target gene. KIAA1061 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1061, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1061 BINDING SITE, designated SEQ ID:35268, to the nucleotide sequence of VGAM1473 RNA, herein designated VGAM RNA, also designated SEQ ID:4184.

[51164] Another function of VGAM1473 is therefore inhibition of KIAA1061 (Accession XM_048786). Accordingly, utilities

of VGAM1473 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1061. KIAA1300 (Accession XM_031744) is another VGAM1473 host target gene. KIAA1300 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1300, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1300 BINDING SITE, designated SEQ ID:31482, to the nucleotide sequence of VGAM1473 RNA, herein designated VGAM RNA, also designated SEQ ID:4184.

[51165] Another function of VGAM1473 is therefore inhibition of KIAA1300 (Accession XM_031744). Accordingly, utilities of VGAM1473 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1300. PRO1386 (Accession NM_031269) is another VGAM1473 host target gene. PRO1386 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRO1386, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1386

BINDING SITE, designated SEQ ID:25291, to the nucleotide sequence of VGAM1473 RNA, herein designated VGAM RNA, also designated SEQ ID:4184.

[51166] Another function of VGAM1473 is therefore inhibition of PRO1386 (Accession NM_031269). Accordingly, utilities of VGAM1473 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1386. Translocase of Outer Mitochondrial Membrane 70 Homolog A (yeast) (TOMM70A, Accession NM_014820) is another VGAM1473 host target gene. TOMM70A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TOMM70A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TOMM70A BINDING SITE, designated SEQ ID:16790, to the nucleotide sequence of VGAM1473 RNA, herein designated VGAM RNA, also designated SEQ ID:4184.

[51167] Another function of VGAM1473 is therefore inhibition of Translocase of Outer Mitochondrial Membrane 70 Homolog A (yeast) (TOMM70A, Accession NM_014820). Accordingly, utilities of VGAM1473 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with TOMM70A. LOC157931 (Accession XM_098845) is another VGAM1473 host target gene. LOC157931 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC157931, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157931 BINDING SITE, designated SEQ ID:41903, to the nucleotide sequence of VGAM1473 RNA, herein designated VGAM RNA, also designated SEQ ID:4184.

[51168] Another function of VGAM1473 is therefore inhibition of LOC157931 (Accession XM_098845). Accordingly, utilities of VGAM1473 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157931. LOC222166 (Accession XM_168425) is another VGAM1473 host target gene. LOC222166 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC222166, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222166 BINDING SITE, designated SEQ ID:45154, to

the nucleotide sequence of VGAM1473 RNA, herein designated VGAM RNA, also designated SEQ ID:4184.

[51169] Another function of VGAM1473 is therefore inhibition of LOC222166 (Accession XM_168425). Accordingly, utilities of VGAM1473 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222166. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1474 (VGAM1474) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51170] VGAM1474 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1474 was detected is described hereinabove with reference to Figs. 1–8.

[51171] VGAM1474 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cocksfoot Streak Virus (CSV). VGAM1474 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51172] VGAM1474 gene encodes a VGAM1474 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1474 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1474 precursor RNA is designated SEQ ID:1460, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1460 is located at position 761 relative to the genome of Cocksfoot Streak Virus (CSV).

- [51173] VGAM1474 precursor RNA folds onto itself, forming VGAM1474 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [51174] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1474 folded precursor RNA into VGAM1474 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1474 RNA is designated SEQ ID:4185, and is provided hereinbelow with reference to the sequence listing part.

[51175] VGAM1474 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1474 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1474 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[51176] VGAM1474 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1474 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1474 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1474 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1474 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[51177] The complementary binding of VGAM1474 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1474 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1474 host target RNA into VGAM1474 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51178] It is appreciated that VGAM1474 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1474 host target genes. The mRNA of each one of this plurality of VGAM1474 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1474 RNA, herein designated VGAM RNA, and which when bound by VGAM1474 RNA causes inhibition of translation of respective one or more VGAM1474 host target proteins.

[51179] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1474 gene, herein designated VGAM GENE, on one or more VGAM1474 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[51180] It is yet further appreciated that a function of VGAM1474 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1474 include diagnosis, prevention and treatment of viral infection by Cocksfoot Streak Virus (CSV). Specific functions, and accordingly utilities, of VGAM1474 correlate with, and may be deduced from, the identity of the host target genes which VGAM1474 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51181] Nucleotide sequences of the VGAM1474 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1474 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1474 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1474 are further described hereinbelow with reference to Table 1.

[51182] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1474 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM1474 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51183] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1474 gene, herein designated VGAM is inhibition of expression of VGAM1474 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1474 correlate with, and may be deduced from, the identity of the target genes which VGAM1474 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[51184] Chondroitin Sulfate Proteoglycan 3 (neurocan) (CSPG3, Accession NM_004386) is a VGAM1474 host target gene. CSPG3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CSPG3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CSPG3 BINDING SITE, designated SEQ ID:10615, to the nucleotide sequence of VGAM1474 RNA, herein designated VGAM RNA, also designated SEQ ID:4185.

[51185] A function of VGAM1474 is therefore inhibition of Chon-

droitin Sulfate Proteoglycan 3 (neurocan) (CSPG3, Accession NM_004386), a gene which may play a role in modulating cell adhesion and migration. Accordingly, utilities of VGAM1474 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSPG3. The function of CSPG3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM634. Protocadherin Alpha 1 (PCDHA1, Accession NM_018900) is another VGAM1474 host target gene. PCDHA1 BINDING SITE1 and PCDHA1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PCDHA1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA1 BINDING SITE1 and PCDHA1 BINDING SITE2, designated SEQ ID:20867 and SEQ ID:25386 respectively, to the nucleotide sequence of VGAM1474 RNA, herein designated VGAM RNA, also designated SEQ ID:4185.

[51186] Another function of VGAM1474 is therefore inhibition of Protocadherin Alpha 1 (PCDHA1, Accession NM_018900). Accordingly, utilities of VGAM1474 include diagnosis,

prevention and treatment of diseases and clinical conditions associated with PCDHA1. Protocadherin Alpha 10 (PCDHA10, Accession NM_018901) is another VGAM1474 host target gene. PCDHA10 BINDING SITE1 and PCDHA10 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PCDHA10, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA10 BINDING SITE1 and PCDHA10 BINDING SITE2, designated SEQ ID:20877 and SEQ ID:20888 respectively, to the nucleotide sequence of VGAM1474 RNA, herein designated VGAM RNA, also designated SEQ ID:4185.

[51187] Another function of VGAM1474 is therefore inhibition of Protocadherin Alpha 10 (PCDHA10, Accession NM_018901). Accordingly, utilities of VGAM1474 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA10. Protocadherin Alpha 13 (PCDHA13, Accession NM_018904) is another VGAM1474 host target gene. PCDHA13 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHA13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA13 BINDING SITE, designated SEQ ID:20908, to the nucleotide sequence of VGAM1474 RNA, herein designated VGAM RNA, also designated SEQ ID:4185.

[51188] Another function of VGAM1474 is therefore inhibition of Protocadherin Alpha 13 (PCDHA13, Accession NM_018904). Accordingly, utilities of VGAM1474 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA13. Protocadherin Alpha 2 (PCDHA2, Accession NM_018905) is another VGAM1474 host target gene. PCDHA2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA2 BINDING SITE, designated SEQ ID:20918, to the nucleotide sequence of VGAM1474 RNA, herein designated VGAM RNA, also designated SEQ ID:4185.

[51189] Another function of VGAM1474 is therefore inhibition of Protocadherin Alpha 2 (PCDHA2, Accession NM_018905). Accordingly, utilities of VGAM1474 include diagnosis,

prevention and treatment of diseases and clinical conditions associated with PCDHA2. Protocadherin Alpha 3 (PCDHA3, Accession NM_018906) is another VGAM1474 host target gene. PCDHA3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA3 BINDING SITE, designated SEQ ID:20928, to the nucleotide sequence of VGAM1474 RNA, herein designated VGAM RNA, also designated SEQ ID:4185.

[51190] Another function of VGAM1474 is therefore inhibition of Protocadherin Alpha 3 (PCDHA3, Accession NM_018906). Accordingly, utilities of VGAM1474 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA3. Protocadherin Alpha 4 (PCDHA4, Accession NM_018907) is another VGAM1474 host target gene. PCDHA4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of PCDHA4 BINDING SITE, designated SEQ ID:20938, to the nucleotide sequence of VGAM1474 RNA, herein designated VGAM RNA, also designated SEQ ID:4185.

[51191] Another function of VGAM1474 is therefore inhibition of Protocadherin Alpha 4 (PCDHA4, Accession NM_018907). Accordingly, utilities of VGAM1474 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA4. Protocadherin Alpha 5 (PCDHA5, Accession NM_018908) is another VGAM1474 host target gene. PCDHA5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHA5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA5 BINDING SITE, designated SEQ ID:20948, to the nucleotide sequence of VGAM1474 RNA, herein designated VGAM RNA, also designated SEQ ID:4185.

[51192] Another function of VGAM1474 is therefore inhibition of Protocadherin Alpha 5 (PCDHA5, Accession NM_018908). Accordingly, utilities of VGAM1474 include diagnosis, prevention and treatment of diseases and clinical condi-

tions associated with PCDHA5. Protocadherin Alpha 6 (PCDHA6, Accession NM_018909) is another VGAM1474 host target gene. PCDHA6 BINDING SITE1 and PCDHA6 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PCDHA6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA6 BINDING SITE1 and PCDHA6 BINDING SITE2, designated SEQ ID:20958 and SEQ ID:25590 respectively, to the nucleotide sequence of VGAM1474 RNA, herein designated VGAM RNA, also designated SEQ ID:4185.

[51193] Another function of VGAM1474 is therefore inhibition of Protocadherin Alpha 6 (PCDHA6, Accession NM_018909). Accordingly, utilities of VGAM1474 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA6. Protocadherin Alpha 8 (PCDHA8, Accession NM_018911) is another VGAM1474 host target gene. PCDHA8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHA8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of PCDHA8 BINDING SITE, designated SEQ ID:20978, to the nucleotide sequence of VGAM1474 RNA, herein designated VGAM RNA, also designated SEQ ID:4185.

[51194] Another function of VGAM1474 is therefore inhibition of Protocadherin Alpha 8 (PCDHA8, Accession NM_018911). Accordingly, utilities of VGAM1474 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA8. Protocadherin Alpha 9 (PCDHA9, Accession NM_031857) is another VGAM1474 host target gene. PCDHA9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHA9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA9 BINDING SITE, designated SEQ ID:25604, to the nucleotide sequence of VGAM1474 RNA, herein designated VGAM RNA, also designated SEQ ID:4185.

[51195] Another function of VGAM1474 is therefore inhibition of Protocadherin Alpha 9 (PCDHA9, Accession NM_031857), a gene which is a calcium-dependent cell-adhesion protein. Accordingly, utilities of VGAM1474 include diagno-

sis, prevention and treatment of diseases and clinical conditions associated with PCDHA9. The function of PCDHA9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM71. Protocadherin Alpha Subfamily C, 1 (PCDHAC1, Accession NM_018898) is another VGAM1474 host target gene. PCDHAC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHAC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHAC1 BINDING SITE, designated SEQ ID:20847, to the nucleotide sequence of VGAM1474 RNA, herein designated VGAM RNA, also designated SEQ ID:4185.

[51196] Another function of VGAM1474 is therefore inhibition of Protocadherin Alpha Subfamily C, 1 (PCDHAC1, Accession NM_018898). Accordingly, utilities of VGAM1474 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHAC1. Protocadherin Alpha Subfamily C, 2 (PCDHAC2, Accession NM_018899) is another VGAM1474 host target gene. PCDHAC2 BIND-

ING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHAC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHAC2 BINDING SITE, designated SEQ ID:20857, to the nucleotide sequence of VGAM1474 RNA, herein designated VGAM RNA, also designated SEQ ID:4185.

[51197] Another function of VGAM1474 is therefore inhibition of Protocadherin Alpha Subfamily C, 2 (PCDHAC2, Accession NM_018899). Accordingly, utilities of VGAM1474 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHAC2. CUG Triplet Repeat, RNA Binding Protein 2 (CUGBP2, Accession NM_006561) is another VGAM1474 host target gene. CUGBP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CUGBP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CUGBP2 BINDING SITE, designated SEQ ID:13332, to the nucleotide sequence of VGAM1474 RNA, herein designated VGAM RNA, also designated SEQ

ID:4185.

[51198] Another function of VGAM1474 is therefore inhibition of CUG Triplet Repeat, RNA Binding Protein 2 (CUGBP2, Accession NM_006561). Accordingly, utilities of VGAM1474 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CUGBP2. PRO2831 (Accession NM_018540) is another VGAM1474 host target gene. PRO2831 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRO2831, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2831 BINDING SITE, designated SEQ ID:20611, to the nucleotide sequence of VGAM1474 RNA, herein designated VGAM RNA, also designated SEQ ID:4185.

[51199] Another function of VGAM1474 is therefore inhibition of PRO2831 (Accession NM_018540). Accordingly, utilities of VGAM1474 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2831. LOC150577 (Accession XM_097918) is another VGAM1474 host target gene. LOC150577 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by LOC150577, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150577 BINDING SITE, designated SEQ ID:41220, to the nucleotide sequence of VGAM1474 RNA, herein designated VGAM RNA, also designated SEQ ID:4185.

[51200] Another function of VGAM1474 is therefore inhibition of LOC150577 (Accession XM_097918). Accordingly, utilities of VGAM1474 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150577. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1475 (VGAM1475) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51201] VGAM1475 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1475 was detected is described hereinabove with reference to Figs. 1-8.

[51202] VGAM1475 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Cocksfoot Streak Virus (CSV). VGAM1475 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51203] VGAM1475 gene encodes a VGAM1475 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1475 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1475 precursor RNA is designated SEQ ID:1461, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1461 is located at position 3422 relative to the genome of Cocksfoot Streak Virus (CSV).

[51204] VGAM1475 precursor RNA folds onto itself, forming VGAM1475 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51205] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1475 folded precursor RNA into VGAM1475 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1475 RNA is designated SEQ ID:4186, and is provided hereinbelow with reference to the sequence listing part.

[51206] VGAM1475 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1475 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1475 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[51207] VGAM1475 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1475 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1475 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1475 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1475 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[51208] The complementary binding of VGAM1475 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1475 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1475

host target RNA into VGAM1475 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51209] It is appreciated that VGAM1475 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1475 host target genes. The mRNA of each one of this plurality of VGAM1475 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1475 RNA, herein designated VGAM RNA, and which when bound by VGAM1475 RNA causes inhibition of translation of respective one or more VGAM1475 host target proteins.

[51210] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1475 gene, herein designated VGAM GENE, on one or more VGAM1475 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[51211] It is yet further appreciated that a function of VGAM1475 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1475 include diagnosis, prevention and treatment of viral infection by Cocksfoot Streak Virus (CSV). Specific functions, and accordingly utilities, of VGAM1475 correlate with, and may be deduced from, the identity of the host target genes which VGAM1475 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51212] Nucleotide sequences of the VGAM1475 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1475 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1475 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1475 are further

described hereinbelow with reference to Table 1.

[51213] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1475 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1475 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51214] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1475 gene, herein designated VGAM is inhibition of expression of VGAM1475 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1475 correlate with, and may be deduced from, the identity of the target genes which VGAM1475 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[51215] Thioredoxin Interacting Protein (TXNIP, Accession NM_006472) is a VGAM1475 host target gene. TXNIP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TXNIP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

TXNIP BINDING SITE, designated SEQ ID:13197, to the nucleotide sequence of VGAM1475 RNA, herein designated VGAM RNA, also designated SEQ ID:4186.

[51216] A function of VGAM1475 is therefore inhibition of Thioredoxin Interacting Protein (TXNIP, Accession NM_006472), a gene which binds and inhibits thioredoxin, a major regulator of cellular redox state. Accordingly, utilities of VGAM1475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TXNIP. The function of TXNIP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM737. Zinc Finger Protein 215 (ZNF215, Accession NM_013250) is another VGAM1475 host target gene. ZNF215 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF215, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF215 BINDING SITE, designated SEQ ID:14913, to the nucleotide sequence of VGAM1475 RNA, herein designated VGAM RNA, also designated SEQ ID:4186.

[51217] Another function of VGAM1475 is therefore inhibition of Zinc Finger Protein 215 (ZNF215, Accession NM_013250). Accordingly, utilities of VGAM1475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF215. ARNTL2 (Accession NM_020183) is another VGAM1475 host target gene. ARNTL2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ARNTL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARNTL2 BINDING SITE, designated SEQ ID:21415, to the nucleotide sequence of VGAM1475 RNA, herein designated VGAM RNA, also designated SEQ ID:4186.

[51218] Another function of VGAM1475 is therefore inhibition of ARNTL2 (Accession NM_020183). Accordingly, utilities of VGAM1475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARNTL2. BNIP-S (Accession NM_138278) is another VGAM1475 host target gene. BNIP-S BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BNIP-S, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BNIP-S BINDING SITE, designated SEQ ID:28691, to the nucleotide sequence of VGAM1475 RNA, herein designated VGAM RNA, also designated SEQ ID:4186.

[51219] Another function of VGAM1475 is therefore inhibition of BNIP-S (Accession NM_138278). Accordingly, utilities of VGAM1475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BNIP-S. DKFZP564D0764 (Accession XM_113964) is another VGAM1475 host target gene. DKFZP564D0764 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564D0764, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564D0764 BINDING SITE, designated SEQ ID:42575, to the nucleotide sequence of VGAM1475 RNA, herein designated VGAM RNA, also designated SEQ ID:4186.

[51220] Another function of VGAM1475 is therefore inhibition of DKFZP564D0764 (Accession XM_113964). Accordingly,

utilities of VGAM1475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564D0764. FLJ10352 (Accession NM_032142) is another VGAM1475 host target gene. FLJ10352 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10352, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10352 BINDING SITE, designated SEQ ID:25825, to the nucleotide sequence of VGAM1475 RNA, herein designated VGAM RNA, also designated SEQ ID:4186.

[51221] Another function of VGAM1475 is therefore inhibition of FLJ10352 (Accession NM_032142). Accordingly, utilities of VGAM1475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10352. LOC120772 (Accession XM_058505) is another VGAM1475 host target gene. LOC120772 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC120772, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC120772 BINDING SITE, designated SEQ ID:36629, to the nucleotide sequence of VGAM1475 RNA, herein designated VGAM RNA, also designated SEQ ID:4186.

[51222] Another function of VGAM1475 is therefore inhibition of LOC120772 (Accession XM_058505). Accordingly, utilities of VGAM1475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC120772. LOC139767 (Accession XM_066883) is another VGAM1475 host target gene. LOC139767 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC139767, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC139767 BINDING SITE, designated SEQ ID:37346, to the nucleotide sequence of VGAM1475 RNA, herein designated VGAM RNA, also designated SEQ ID:4186.

[51223] Another function of VGAM1475 is therefore inhibition of LOC139767 (Accession XM_066883). Accordingly, utilities of VGAM1475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC139767. LOC154007 (Accession XM_087824) is another VGAM1475 host target gene. LOC154007 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC154007, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154007 BINDING SITE, designated SEQ ID:39454, to the nucleotide sequence of VGAM1475 RNA, herein designated VGAM RNA, also designated SEQ ID:4186.

[51224] Another function of VGAM1475 is therefore inhibition of LOC154007 (Accession XM_087824). Accordingly, utilities of VGAM1475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154007. LOC256867 (Accession XM_170694) is another VGAM1475 host target gene. LOC256867 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256867, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256867 BINDING SITE, designated SEQ ID:45475, to the nucleotide sequence of VGAM1475 RNA, herein designated VGAM RNA, also designated SEQ ID:4186.

[51225] Another function of VGAM1475 is therefore inhibition of

LOC256867 (Accession XM_170694). Accordingly, utilities of VGAM1475 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256867. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1476 (VGAM1476) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51226] VGAM1476 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1476 was detected is described hereinabove with reference to Figs. 1-8.

[51227] VGAM1476 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cocksfoot Streak Virus (CSV). VGAM1476 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51228] VGAM1476 gene encodes a VGAM1476 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1476 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1476 precursor RNA is designated SEQ ID:1462, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1462 is located at position 7485 relative to the genome of Cocksfoot Streak Virus (CSV).

- [51229] VGAM1476 precursor RNA folds onto itself, forming VGAM1476 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [51230] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1476 folded precursor RNA into VGAM1476 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide se-

quence of VGAM1476 RNA is designated SEQ ID:4187, and is provided hereinbelow with reference to the sequence listing part.

[51231] VGAM1476 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1476 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1476 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[51232] VGAM1476 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1476 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1476 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM1476 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1476 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[51233] The complementary binding of VGAM1476 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1476 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1476 host target RNA into VGAM1476 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51234] It is appreciated that VGAM1476 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1476 host target genes. The mRNA of each one of this plurality of VGAM1476 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1476 RNA, herein designated VGAM RNA, and which when bound by VGAM1476 RNA causes inhibition of translation of respective one or more VGAM1476 host target proteins.

[51235] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1476 gene, herein designated VGAM GENE, on one or more VGAM1476 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[51236] It is yet further appreciated that a function of VGAM1476

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1476 include diagnosis, prevention and treatment of viral infection by Cocksfoot Streak Virus (CSV). Specific functions, and accordingly utilities, of VGAM1476 correlate with, and may be deduced from, the identity of the host target genes which VGAM1476 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51237] Nucleotide sequences of the VGAM1476 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1476 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1476 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1476 are further described hereinbelow with reference to Table 1.

[51238] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1476 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1476 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51239] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1476 gene, herein designated VGAM is inhibition of expression of VGAM1476 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1476 correlate with, and may be deduced from, the identity of the target genes which VGAM1476 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[51240] Chromosome 8 Open Reading Frame 14 (C8orf14, Accession NM_054029) is a VGAM1476 host target gene. C8orf14 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by C8orf14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C8orf14 BINDING SITE, designated SEQ ID:27640, to the nucleotide sequence of VGAM1476 RNA, herein designated VGAM RNA, also designated SEQ ID:4187.

[51241] A function of VGAM1476 is therefore inhibition of Chromosome 8 Open Reading Frame 14 (C8orf14, Accession NM_054029). Accordingly, utilities of VGAM1476 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with C8orf14. CXYorf1 (Accession XM_088704) is another VGAM1476 host target gene. CXYorf1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CXYorf1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CXYorf1 BINDING SITE, designated SEQ ID:39916, to the nucleotide sequence of VGAM1476 RNA, herein designated VGAM RNA, also designated SEQ ID:4187.

[51242] Another function of VGAM1476 is therefore inhibition of CXYorf1 (Accession XM_088704). Accordingly, utilities of VGAM1476 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CXYorf1. FLJ31709 (Accession NM_144636) is another VGAM1476 host target gene. FLJ31709 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ31709, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ31709 BINDING SITE, designated SEQ ID:29458, to the nucleotide

sequence of VGAM1476 RNA, herein designated VGAM RNA, also designated SEQ ID:4187.

[51243] Another function of VGAM1476 is therefore inhibition of FLJ31709 (Accession NM_144636). Accordingly, utilities of VGAM1476 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31709. Histidyl-tRNA Synthetase-like (HARSL, Accession NM_012208) is another VGAM1476 host target gene. HARSL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HARSL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HARSL BINDING SITE, designated SEQ ID:14510, to the nucleotide sequence of VGAM1476 RNA, herein designated VGAM RNA, also designated SEQ ID:4187.

[51244] Another function of VGAM1476 is therefore inhibition of Histidyl-tRNA Synthetase-like (HARSL, Accession NM_012208). Accordingly, utilities of VGAM1476 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HARSL. KIAA0513 (Accession NM_014732) is another VGAM1476 host target

gene. KIAA0513 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0513, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0513 BINDING SITE, designated SEQ ID:16356, to the nucleotide sequence of VGAM1476 RNA, herein designated VGAM RNA, also designated SEQ ID:4187.

[51245] Another function of VGAM1476 is therefore inhibition of KIAA0513 (Accession NM_014732). Accordingly, utilities of VGAM1476 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0513. LOC166042 (Accession XM_093623) is another VGAM1476 host target gene. LOC166042 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC166042, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC166042 BINDING SITE, designated SEQ ID:40198, to the nucleotide sequence of VGAM1476 RNA, herein designated VGAM RNA, also designated SEQ ID:4187.

[51246] Another function of VGAM1476 is therefore inhibition of LOC166042 (Accession XM_093623). Accordingly, utilities of VGAM1476 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC166042. LOC200093 (Accession XM_032184) is another VGAM1476 host target gene. LOC200093 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC200093, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200093 BINDING SITE, designated SEQ ID:31607, to the nucleotide sequence of VGAM1476 RNA, herein designated VGAM RNA, also designated SEQ ID:4187.

[51247] Another function of VGAM1476 is therefore inhibition of LOC200093 (Accession XM_032184). Accordingly, utilities of VGAM1476 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200093. LOC91040 (Accession XM_035641) is another VGAM1476 host target gene. LOC91040 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91040, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91040 BINDING SITE, designated SEQ ID:32326, to the nucleotide sequence of VGAM1476 RNA, herein designated VGAM RNA, also designated SEQ ID:4187.

[51248] Another function of VGAM1476 is therefore inhibition of LOC91040 (Accession XM_035641). Accordingly, utilities of VGAM1476 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91040. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1477 (VGAM1477) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51249] VGAM1477 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1477 was detected is described hereinabove with reference to Figs. 1–8.

[51250] VGAM1477 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cocksfoot Streak Virus (CSV). VGAM1477 host target gene, herein designated

VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51251] VGAM1477 gene encodes a VGAM1477 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1477 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1477 precursor RNA is designated SEQ ID:1463, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1463 is located at position 5489 relative to the genome of Cocksfoot Streak Virus (CSV).

[51252] VGAM1477 precursor RNA folds onto itself, forming VGAM1477 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51253] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1477 folded precursor RNA into VGAM1477

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 90%) nucleotide sequence of VGAM1477 RNA is designated SEQ ID:4188, and is provided hereinbelow with reference to the sequence listing part.

[51254] VGAM1477 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1477 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1477 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[51255] VGAM1477 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1477 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1477 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1477 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1477 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[51256] The complementary binding of VGAM1477 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1477 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1477 host target RNA into VGAM1477 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[51257] It is appreciated that VGAM1477 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1477 host target genes. The mRNA of each one of this plurality of VGAM1477 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1477 RNA, herein designated VGAM RNA, and which when bound by VGAM1477 RNA causes inhibition of translation of respective one or more VGAM1477 host target proteins.

[51258] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1477 gene, herein designated VGAM GENE, on one or more VGAM1477 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[51259] It is yet further appreciated that a function of VGAM1477 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1477 include diagnosis, prevention and treatment of viral infection by Cocksfoot Streak Virus (CSV). Specific functions, and accordingly utilities, of VGAM1477 correlate with, and may be deduced from, the identity of the host target genes which VGAM1477 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51260] Nucleotide sequences of the VGAM1477 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1477 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1477 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1477 are further described hereinbelow with reference to Table 1.

[51261] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1477 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1477 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51262] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1477 gene, herein designated VGAM is inhibition of expression of VGAM1477 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1477 correlate with, and may be deduced from, the identity of the target genes which VGAM1477 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[51263] LAG1 Longevity Assurance Homolog 2 (*S. cerevisiae*) (LASS2, Accession XM_041889) is a VGAM1477 host target gene. LASS2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LASS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LASS2 BINDING SITE, designated SEQ ID:33621, to the nucleotide sequence of VGAM1477 RNA,

herein designated VGAM RNA, also designated SEQ ID:4188.

[51264] A function of VGAM1477 is therefore inhibition of LAG1 Longevity Assurance Homolog 2 (*S. cerevisiae*) (LASS2, Accession XM_041889). Accordingly, utilities of VGAM1477 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LASS2. HEMK (Accession NM_016173) is another VGAM1477 host target gene. HEMK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HEMK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HEMK BINDING SITE, designated SEQ ID:18263, to the nucleotide sequence of VGAM1477 RNA, herein designated VGAM RNA, also designated SEQ ID:4188.

[51265] Another function of VGAM1477 is therefore inhibition of HEMK (Accession NM_016173). Accordingly, utilities of VGAM1477 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HEMK. LOC145623 (Accession XM_096822) is another VGAM1477 host target gene. LOC145623 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by LOC145623, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145623 BINDING SITE, designated SEQ ID:40543, to the nucleotide sequence of VGAM1477 RNA, herein designated VGAM RNA, also designated SEQ ID:4188.

[51266] Another function of VGAM1477 is therefore inhibition of LOC145623 (Accession XM_096822). Accordingly, utilities of VGAM1477 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145623. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1478 (VGAM1478) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51267] VGAM1478 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1478 was detected is described hereinabove with reference to Figs. 1-8.

[51268] VGAM1478 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Brome Streak Mosaic Virus. VGAM1478 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51269] VGAM1478 gene encodes a VGAM1478 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1478 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1478 precursor RNA is designated SEQ ID:1464, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1464 is located at position 7727 relative to the genome of Brome Streak Mosaic Virus.

[51270] VGAM1478 precursor RNA folds onto itself, forming VGAM1478 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51271] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1478 folded precursor RNA into VGAM1478 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 56%) nucleotide sequence of VGAM1478 RNA is designated SEQ ID:4189, and is provided hereinbelow with reference to the sequence listing part.

[51272] VGAM1478 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1478 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1478 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[51273] VGAM1478 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1478 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1478 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1478 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1478 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[51274] The complementary binding of VGAM1478 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1478 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1478

host target RNA into VGAM1478 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51275] It is appreciated that VGAM1478 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1478 host target genes. The mRNA of each one of this plurality of VGAM1478 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1478 RNA, herein designated VGAM RNA, and which when bound by VGAM1478 RNA causes inhibition of translation of respective one or more VGAM1478 host target proteins.

[51276] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1478 gene, herein designated VGAM GENE, on one or more VGAM1478 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[51277] It is yet further appreciated that a function of VGAM1478 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1478 include diagnosis, prevention and treatment of viral infection by Brome Streak Mosaic Virus. Specific functions, and accordingly utilities, of VGAM1478 correlate with, and may be deduced from, the identity of the host target genes which VGAM1478 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51278] Nucleotide sequences of the VGAM1478 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1478 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1478 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1478 are further

described hereinbelow with reference to Table 1.

[51279] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1478 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1478 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51280] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1478 gene, herein designated VGAM is inhibition of expression of VGAM1478 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1478 correlate with, and may be deduced from, the identity of the target genes which VGAM1478 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[51281] FLJ12704 (Accession NM_024998) is a VGAM1478 host target gene. FLJ12704 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12704, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12704 BINDING SITE,

designated SEQ ID:24563, to the nucleotide sequence of VGAM1478 RNA, herein designated VGAM RNA, also designated SEQ ID:4189.

[51282] A function of VGAM1478 is therefore inhibition of FLJ12704 (Accession NM_024998). Accordingly, utilities of VGAM1478 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12704. MEGF10 (Accession NM_032446) is another VGAM1478 host target gene. MEGF10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MEGF10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MEGF10 BINDING SITE, designated SEQ ID:26212, to the nucleotide sequence of VGAM1478 RNA, herein designated VGAM RNA, also designated SEQ ID:4189.

[51283] Another function of VGAM1478 is therefore inhibition of MEGF10 (Accession NM_032446). Accordingly, utilities of VGAM1478 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEGF10. LOC90133 (Accession XM_029323) is another VGAM1478 host target gene. LOC90133 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90133, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90133 BINDING SITE, designated SEQ ID:30867, to the nucleotide sequence of VGAM1478 RNA, herein designated VGAM RNA, also designated SEQ ID:4189.

[51284] Another function of VGAM1478 is therefore inhibition of LOC90133 (Accession XM_029323). Accordingly, utilities of VGAM1478 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90133. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1479 (VGAM1479) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51285] VGAM1479 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1479 was detected is described hereinabove with reference to Figs. 1-8.

[51286] VGAM1479 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Brome Streak Mosaic Virus. VGAM1479 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51287] VGAM1479 gene encodes a VGAM1479 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1479 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1479 precursor RNA is designated SEQ ID:1465, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1465 is located at position 2629 relative to the genome of Brome Streak Mosaic Virus.

[51288] VGAM1479 precursor RNA folds onto itself, forming VGAM1479 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[51289] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1479 folded precursor RNA into VGAM1479 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1479 RNA is designated SEQ ID:4190, and is provided hereinbelow with reference to the sequence listing part.

[51290] VGAM1479 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1479 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1479 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[51291] VGAM1479 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1479 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1479 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1479 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1479 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[51292] The complementary binding of VGAM1479 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1479 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1479 host target RNA into VGAM1479 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51293] It is appreciated that VGAM1479 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1479 host target genes. The mRNA of each one of this plurality of VGAM1479 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1479 RNA, herein designated VGAM RNA, and which when bound by VGAM1479 RNA causes inhibition of translation of respective one or more VGAM1479 host target proteins.

[51294] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1479 gene, herein designated VGAM GENE, on one or more VGAM1479 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[51295] It is yet further appreciated that a function of VGAM1479 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1479 include diagnosis, prevention and treatment of viral infection by Brome Streak Mosaic Virus. Specific functions, and accordingly utilities, of VGAM1479 correlate with, and may be deduced from, the identity of the host target genes which VGAM1479 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51296] Nucleotide sequences of the VGAM1479 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1479 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1479 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1479 are further described hereinbelow with reference to Table 1.

[51297] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1479 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1479 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51298] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1479 gene, herein designated VGAM is inhibition of expression of VGAM1479 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1479 correlate with, and may be deduced from, the identity of the target genes which VGAM1479 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[51299] FIBL-6 (Accession XM_053531) is a VGAM1479 host target gene. FIBL-6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FIBL-6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of FIBL-6 BINDING SITE, designated SEQ ID:36100, to the nucleotide sequence of VGAM1479 RNA, herein designated VGAM RNA, also designated SEQ ID:4190.

[51300] A function of VGAM1479 is therefore inhibition of FIBL-6 (Accession XM_053531). Accordingly, utilities of VGAM1479 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FIBL-6. KIAA1795 (Accession XM_050988) is another VGAM1479 host target gene. KIAA1795 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1795, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1795 BINDING SITE, designated SEQ ID:35697, to the nucleotide sequence of VGAM1479 RNA, herein designated VGAM RNA, also designated SEQ ID:4190.

[51301] Another function of VGAM1479 is therefore inhibition of KIAA1795 (Accession XM_050988). Accordingly, utilities of VGAM1479 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1795. LOC91263 (Accession XM_037264) is another

VGAM1479 host target gene. LOC91263 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91263, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91263 BINDING SITE, designated SEQ ID:32594, to the nucleotide sequence of VGAM1479 RNA, herein designated VGAM RNA, also designated SEQ ID:4190.

[51302] Another function of VGAM1479 is therefore inhibition of LOC91263 (Accession XM_037264). Accordingly, utilities of VGAM1479 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91263. LOC92391 (Accession XM_044793) is another VGAM1479 host target gene. LOC92391 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92391, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92391 BINDING SITE, designated SEQ ID:34270, to the nucleotide sequence of VGAM1479 RNA, herein designated VGAM RNA, also designated SEQ ID:4190.

[51303] Another function of VGAM1479 is therefore inhibition of LOC92391 (Accession XM_044793). Accordingly, utilities of VGAM1479 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92391. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1480 (VGAM1480) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51304] VGAM1480 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1480 was detected is described hereinabove with reference to Figs. 1–8.

[51305] VGAM1480 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Brome Streak Mosaic Virus. VGAM1480 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51306] VGAM1480 gene encodes a VGAM1480 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM1480 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1480 precursor RNA is designated SEQ ID:1466, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1466 is located at position 9535 relative to the genome of Brome Streak Mosaic Virus.

[51307] VGAM1480 precursor RNA folds onto itself, forming VGAM1480 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51308] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1480 folded precursor RNA into VGAM1480 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 86%) nucleotide sequence of VGAM1480 RNA is designated SEQ ID:4191, and is provided hereinbelow with reference to the sequence listing part.

[51309] VGAM1480 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1480 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1480 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[51310] VGAM1480 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1480 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1480 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1480 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1480 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[51311] The complementary binding of VGAM1480 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1480 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1480 host target RNA into VGAM1480 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51312] It is appreciated that VGAM1480 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1480 host target genes. The mRNA of each one of this plurality of VGAM1480 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1480 RNA, herein designated VGAM RNA, and which when bound by VGAM1480 RNA causes inhibition of translation of respective one or more VGAM1480 host target proteins.

[51313] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1480 gene, herein designated VGAM GENE, on one or more VGAM1480 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[51314] It is yet further appreciated that a function of VGAM1480 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1480 include diagnosis, prevention and treatment of viral infection by Brome Streak Mosaic Virus. Specific functions, and accordingly utilities, of VGAM1480 correlate with, and may be deduced from, the identity of the host target genes which VGAM1480 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51315] Nucleotide sequences of the VGAM1480 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1480 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1480 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1480 are further described hereinbelow with reference to Table 1.

[51316] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1480 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1480 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[51317] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1480 gene, herein designated VGAM is inhibition of expression of VGAM1480 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1480 correlate with, and may be deduced from, the identity of the target genes which VGAM1480 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[51318] Dual Specificity Phosphatase 4 (DUSP4, Accession NM_057158) is a VGAM1480 host target gene. DUSP4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DUSP4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DUSP4 BINDING SITE, designated SEQ ID:27666, to the nucleotide sequence of VGAM1480 RNA, herein designated VGAM RNA, also designated SEQ ID:4191.

[51319] A function of VGAM1480 is therefore inhibition of Dual Specificity Phosphatase 4 (DUSP4, Accession NM_057158), a gene which regulates mitogenic signal transduction. Accordingly, utilities of VGAM1480 include diagnosis, pre-

vention and treatment of diseases and clinical conditions associated with DUSP4. The function of DUSP4 and its association with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM110. Neurexin 2 (NRXN2, Accession NM_138732) is another VGAM1480 host target gene. NRXN2 BINDING SITE1 through NRXN2 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by NRXN2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NRXN2 BINDING SITE1 through NRXN2 BINDING SITE3, designated SEQ ID:28982, SEQ ID:28988 and SEQ ID:17466 respectively, to the nucleotide sequence of VGAM1480 RNA, herein designated VGAM RNA, also designated SEQ ID:4191.

[51320] Another function of VGAM1480 is therefore inhibition of Neurexin 2 (NRXN2, Accession NM_138732), a gene which may be involved in cell recognition, cell adhesion, and may mediate intracellular signaling. Accordingly, utilities of VGAM1480 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

NRXN2. The function of NRXN2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM178.POM (POM121 homolog, rat) and ZP3 Fusion (POMZP3, Accession NM_012230) is another VGAM1480 host target gene. POMZP3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by POMZP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POMZP3 BINDING SITE, designated SEQ ID:14528, to the nucleotide sequence of VGAM1480 RNA, herein designated VGAM RNA, also designated SEQ ID:4191.

[51321] Another function of VGAM1480 is therefore inhibition of POM (POM121 homolog, rat) and ZP3 Fusion (POMZP3, Accession NM_012230). Accordingly, utilities of VGAM1480 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POMZP3. DKFZp434I099 (Accession NM_032269) is another VGAM1480 host target gene. DKFZp434I099 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZp434I099,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434I099 BINDING SITE, designated SEQ ID:26016, to the nucleotide sequence of VGAM1480 RNA, herein designated VGAM RNA, also designated SEQ ID:4191.

[51322] Another function of VGAM1480 is therefore inhibition of DKFZp434I099 (Accession NM_032269). Accordingly, utilities of VGAM1480 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434I099. KIAA0828 (Accession XM_088105) is another VGAM1480 host target gene. KIAA0828 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0828, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0828 BINDING SITE, designated SEQ ID:39511, to the nucleotide sequence of VGAM1480 RNA, herein designated VGAM RNA, also designated SEQ ID:4191.

[51323] Another function of VGAM1480 is therefore inhibition of KIAA0828 (Accession XM_088105). Accordingly, utilities

of VGAM1480 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0828. MGC2452 (Accession NM_032644) is another VGAM1480 host target gene. MGC2452 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC2452, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2452 BINDING SITE, designated SEQ ID:26365, to the nucleotide sequence of VGAM1480 RNA, herein designated VGAM RNA, also designated SEQ ID:4191.

[51324] Another function of VGAM1480 is therefore inhibition of MGC2452 (Accession NM_032644). Accordingly, utilities of VGAM1480 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2452. MGC4655 (Accession NM_033309) is another VGAM1480 host target gene. MGC4655 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC4655, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4655

BINDING SITE, designated SEQ ID:27147, to the nucleotide sequence of VGAM1480 RNA, herein designated VGAM RNA, also designated SEQ ID:4191.

[51325] Another function of VGAM1480 is therefore inhibition of MGC4655 (Accession NM_033309). Accordingly, utilities of VGAM1480 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4655. LOC145945 (Accession XM_096908) is another VGAM1480 host target gene. LOC145945 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145945, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145945 BINDING SITE, designated SEQ ID:40630, to the nucleotide sequence of VGAM1480 RNA, herein designated VGAM RNA, also designated SEQ ID:4191.

[51326] Another function of VGAM1480 is therefore inhibition of LOC145945 (Accession XM_096908). Accordingly, utilities of VGAM1480 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145945. LOC219513 (Accession XM_169166) is another VGAM1480 host target gene. LOC219513 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219513, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219513 BINDING SITE, designated SEQ ID:45290, to the nucleotide sequence of VGAM1480 RNA, herein designated VGAM RNA, also designated SEQ ID:4191.

[51327] Another function of VGAM1480 is therefore inhibition of LOC219513 (Accession XM_169166). Accordingly, utilities of VGAM1480 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219513. LOC220021 (Accession XM_167814) is another VGAM1480 host target gene. LOC220021 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220021, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220021 BINDING SITE, designated SEQ ID:44849, to the nucleotide sequence of VGAM1480 RNA, herein designated VGAM RNA, also designated SEQ ID:4191.

[51328] Another function of VGAM1480 is therefore inhibition of

LOC220021 (Accession XM_167814). Accordingly, utilities of VGAM1480 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220021. LOC90918 (Accession XM_034863) is another VGAM1480 host target gene. LOC90918 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC90918, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90918 BINDING SITE, designated SEQ ID:32176, to the nucleotide sequence of VGAM1480 RNA, herein designated VGAM RNA, also designated SEQ ID:4191.

[51329] Another function of VGAM1480 is therefore inhibition of LOC90918 (Accession XM_034863). Accordingly, utilities of VGAM1480 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90918. LOC92340 (Accession XM_044426) is another VGAM1480 host target gene. LOC92340 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC92340, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC92340 BINDING SITE, designated SEQ ID:34197, to the nucleotide sequence of VGAM1480 RNA, herein designated VGAM RNA, also designated SEQ ID:4191.

[51330] Another function of VGAM1480 is therefore inhibition of LOC92340 (Accession XM_044426). Accordingly, utilities of VGAM1480 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92340. LOC93166 (Accession XM_049619) is another VGAM1480 host target gene. LOC93166 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC93166, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93166 BINDING SITE, designated SEQ ID:35461, to the nucleotide sequence of VGAM1480 RNA, herein designated VGAM RNA, also designated SEQ ID:4191.

[51331] Another function of VGAM1480 is therefore inhibition of LOC93166 (Accession XM_049619). Accordingly, utilities of VGAM1480 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93166. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1481 (VGAM1481) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51332] VGAM1481 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1481 was detected is described hereinabove with reference to Figs. 1–8.

[51333] VGAM1481 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Brome Streak Mosaic Virus. VGAM1481 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51334] VGAM1481 gene encodes a VGAM1481 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1481 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1481 precursor RNA is designated SEQ ID:1467, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:1467 is located at position 953 relative to the genome of Brome Streak Mosaic Virus.

[51335] VGAM1481 precursor RNA folds onto itself, forming VGAM1481 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51336] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1481 folded precursor RNA into VGAM1481 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM1481 RNA is designated SEQ ID:4192, and is provided hereinbelow with reference to the sequence listing part.

[51337] VGAM1481 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1481 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1481 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[51338] VGAM1481 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1481 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1481 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1481 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1481 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[51339] The complementary binding of VGAM1481 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1481 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1481 host target RNA into VGAM1481 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51340] It is appreciated that VGAM1481 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1481 host target genes. The mRNA of each one of this plurality of VGAM1481 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1481 RNA, herein designated VGAM RNA, and which when bound by VGAM1481 RNA causes inhibition of translation of respective one or more

VGAM1481 host target proteins.

[51341] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1481 gene, herein designated VGAM GENE, on one or more VGAM1481 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[51342] It is yet further appreciated that a function of VGAM1481 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1481 include diagnosis, prevention and treatment of viral infection by Brome Streak Mosaic Virus.

Specific functions, and accordingly utilities, of VGAM1481 correlate with, and may be deduced from, the identity of the host target genes which VGAM1481 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51343] Nucleotide sequences of the VGAM1481 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1481 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1481 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1481 are further described hereinbelow with reference to Table 1.

[51344] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1481 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1481 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51345] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1481 gene, herein designated VGAM is inhibition of expression of VGAM1481 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM1481 correlate with, and may be deduced from, the identity of the target genes which VGAM1481 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[51346] Melanoma Antigen, Family A, 10 (MAGEA10, Accession NM_021048) is a VGAM1481 host target gene. MAGEA10 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MAGEA10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAGEA10 BINDING SITE, designated SEQ ID:22033, to the nucleotide sequence of VGAM1481 RNA, herein designated VGAM RNA, also designated SEQ ID:4192.

[51347] A function of VGAM1481 is therefore inhibition of Melanoma Antigen, Family A, 10 (MAGEA10, Accession NM_021048), a gene which may play a role in embryonal development and tumor transformation or aspects of tumor progression. Accordingly, utilities of VGAM1481 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAGEA10. The function of MAGEA10 and its association with various diseases and

clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM125. Phosphoribosyl Pyrophosphate Synthetase 2 (PRPS2, Accession NM_002765) is another VGAM1481 host target gene. PRPS2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRPS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRPS2 BINDING SITE, designated SEQ ID:8654, to the nucleotide sequence of VGAM1481 RNA, herein designated VGAM RNA, also designated SEQ ID:4192.

[51348] Another function of VGAM1481 is therefore inhibition of Phosphoribosyl Pyrophosphate Synthetase 2 (PRPS2, Accession NM_002765), a gene which generates the PRPP needed for initiation of purine biosynthesis. Accordingly, utilities of VGAM1481 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRPS2. The function of PRPS2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM828. Dickkopf Homolog 2 (*Xenopus lae-*

vis) (DKK2, Accession NM_014421) is another VGAM1481 host target gene. DKK2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKK2 BINDING SITE, designated SEQ ID:15774, to the nucleotide sequence of VGAM1481 RNA, herein designated VGAM RNA, also designated SEQ ID:4192.

[51349] Another function of VGAM1481 is therefore inhibition of Dickkopf Homolog 2 (*Xenopus laevis*) (DKK2, Accession NM_014421). Accordingly, utilities of VGAM1481 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKK2. FLJ12838 (Accession NM_024641) is another VGAM1481 host target gene. FLJ12838 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ12838, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12838 BINDING SITE, designated SEQ ID:23925, to the nucleotide sequence of VGAM1481 RNA,

herein designated VGAM RNA, also designated SEQ ID:4192.

[51350] Another function of VGAM1481 is therefore inhibition of FLJ12838 (Accession NM_024641). Accordingly, utilities of VGAM1481 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12838. KIAA0781 (Accession XM_041314) is another VGAM1481 host target gene. KIAA0781 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0781, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0781 BINDING SITE, designated SEQ ID:33498, to the nucleotide sequence of VGAM1481 RNA, herein designated VGAM RNA, also designated SEQ ID:4192.

[51351] Another function of VGAM1481 is therefore inhibition of KIAA0781 (Accession XM_041314). Accordingly, utilities of VGAM1481 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0781. SEC8 (Accession NM_021807) is another VGAM1481 host target gene. SEC8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region

of mRNA encoded by SEC8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEC8 BINDING SITE, designated SEQ ID:22358, to the nucleotide sequence of VGAM1481 RNA, herein designated VGAM RNA, also designated SEQ ID:4192.

[51352] Another function of VGAM1481 is therefore inhibition of SEC8 (Accession NM_021807). Accordingly, utilities of VGAM1481 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEC8. SOX30 (Accession NM_007017) is another VGAM1481 host target gene. SOX30 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SOX30, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SOX30 BINDING SITE, designated SEQ ID:13873, to the nucleotide sequence of VGAM1481 RNA, herein designated VGAM RNA, also designated SEQ ID:4192.

[51353] Another function of VGAM1481 is therefore inhibition of SOX30 (Accession NM_007017). Accordingly, utilities of

VGAM1481 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SOX30. LOC144455 (Accession XM_084871) is another VGAM1481 host target gene. LOC144455 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC144455, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144455 BINDING SITE, designated SEQ ID:37750, to the nucleotide sequence of VGAM1481 RNA, herein designated VGAM RNA, also designated SEQ ID:4192.

[51354] Another function of VGAM1481 is therefore inhibition of LOC144455 (Accession XM_084871). Accordingly, utilities of VGAM1481 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144455. LOC145644 (Accession XM_035608) is another VGAM1481 host target gene. LOC145644 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145644, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC145644 BINDING SITE, designated SEQ ID:32290, to the nucleotide sequence of VGAM1481 RNA, herein designated VGAM RNA, also designated SEQ ID:4192.

[51355] Another function of VGAM1481 is therefore inhibition of LOC145644 (Accession XM_035608). Accordingly, utilities of VGAM1481 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145644. LOC200953 (Accession XM_117302) is another VGAM1481 host target gene. LOC200953 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC200953, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200953 BINDING SITE, designated SEQ ID:43367, to the nucleotide sequence of VGAM1481 RNA, herein designated VGAM RNA, also designated SEQ ID:4192.

[51356] Another function of VGAM1481 is therefore inhibition of LOC200953 (Accession XM_117302). Accordingly, utilities of VGAM1481 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200953. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 1482 (VGAM1482) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51357] VGAM1482 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1482 was detected is described hereinabove with reference to Figs. 1–8.

[51358] VGAM1482 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Brome Streak Mosaic Virus. VGAM1482 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51359] VGAM1482 gene encodes a VGAM1482 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1482 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1482 precursor RNA is designated SEQ ID:1468, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1468 is located at position 40 relative to the

genome of Brome Streak Mosaic Virus.

- [51360] VGAM1482 precursor RNA folds onto itself, forming VGAM1482 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [51361] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1482 folded precursor RNA into VGAM1482 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1482 RNA is designated SEQ ID:4193, and is provided hereinbelow with reference to the sequence listing part.
- [51362] VGAM1482 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1482 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1482 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[51363] VGAM1482 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1482 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1482 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1482 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1482 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[51364] The complementary binding of VGAM1482 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1482 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1482 host target RNA into VGAM1482 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51365] It is appreciated that VGAM1482 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1482 host target genes. The mRNA of each one of this plurality of VGAM1482 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1482 RNA, herein designated VGAM RNA, and which when bound by VGAM1482 RNA causes inhibition of translation of respective one or more VGAM1482 host target proteins.

[51366] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1482 gene, herein designated VGAM GENE, on one or more VGAM1482 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[51367] It is yet further appreciated that a function of VGAM1482 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1482 include diagnosis, prevention and treatment of viral infection by Brome Streak Mosaic Virus. Specific functions, and accordingly utilities, of VGAM1482

correlate with, and may be deduced from, the identity of the host target genes which VGAM1482 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51368] Nucleotide sequences of the VGAM1482 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1482 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1482 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1482 are further described hereinbelow with reference to Table 1.

[51369] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1482 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1482 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51370] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1482 gene, herein designated VGAM is inhibition of expression of VGAM1482 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1482 correlate with, and may be deduced

from, the identity of the target genes which VGAM1482 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[51371] Centaurin, Gamma 1 (CENTG1, Accession NM_014770) is a VGAM1482 host target gene. CENTG1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CENTG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CENTG1 BINDING SITE, designated SEQ ID:16565, to the nucleotide sequence of VGAM1482 RNA, herein designated VGAM RNA, also designated SEQ ID:4193.

[51372] A function of VGAM1482 is therefore inhibition of Centaurin, Gamma 1 (CENTG1, Accession NM_014770). Accordingly, utilities of VGAM1482 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CENTG1. FLJ11726 (Accession NM_024971) is another VGAM1482 host target gene. FLJ11726 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11726, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11726 BINDING SITE, designated SEQ ID:24524, to the nucleotide sequence of VGAM1482 RNA, herein designated VGAM RNA, also designated SEQ ID:4193.

[51373] Another function of VGAM1482 is therefore inhibition of FLJ11726 (Accession NM_024971). Accordingly, utilities of VGAM1482 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11726. LOC219731 (Accession XM_167596) is another VGAM1482 host target gene. LOC219731 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC219731, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219731 BINDING SITE, designated SEQ ID:44716, to the nucleotide sequence of VGAM1482 RNA, herein designated VGAM RNA, also designated SEQ ID:4193.

[51374] Another function of VGAM1482 is therefore inhibition of LOC219731 (Accession XM_167596). Accordingly, utilities of VGAM1482 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC219731. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1483 (VGAM1483) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51375] VGAM1483 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1483 was detected is described hereinabove with reference to Figs. 1–8.

[51376] VGAM1483 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Brome Streak Mosaic Virus. VGAM1483 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51377] VGAM1483 gene encodes a VGAM1483 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1483 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1483 precursor RNA is designated SEQ ID:1469, and is provided hereinbelow with ref–

erence to the sequence listing part. Nucleotide sequence SEQ ID:1469 is located at position 7435 relative to the genome of Brome Streak Mosaic Virus.

- [51378] VGAM1483 precursor RNA folds onto itself, forming VGAM1483 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [51379] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1483 folded precursor RNA into VGAM1483 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM1483 RNA is designated SEQ ID:4194, and is provided hereinbelow with reference to the sequence listing part.

[51380] VGAM1483 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1483 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1483 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[51381] VGAM1483 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1483 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1483 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1483 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM1483 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[51382] The complementary binding of VGAM1483 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1483 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1483 host target RNA into VGAM1483 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51383] It is appreciated that VGAM1483 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1483 host target genes. The mRNA of each one of this plurality of VGAM1483 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1483 RNA, herein designated VGAM RNA, and which when bound by VGAM1483 RNA causes

inhibition of translation of respective one or more VGAM1483 host target proteins.

[51384] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1483 gene, herein designated VGAM GENE, on one or more VGAM1483 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[51385] It is yet further appreciated that a function of VGAM1483 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1483 include diagnosis, prevention and

treatment of viral infection by Brome Streak Mosaic Virus. Specific functions, and accordingly utilities, of VGAM1483 correlate with, and may be deduced from, the identity of the host target genes which VGAM1483 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51386] Nucleotide sequences of the VGAM1483 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1483 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1483 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1483 are further described hereinbelow with reference to Table 1.

[51387] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1483 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1483 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51388] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1483 gene, herein designated VGAM is inhibition of expression of VGAM1483 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM1483 correlate with, and may be deduced from, the identity of the target genes which VGAM1483 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[51389] Tumor Necrosis Factor (ligand) Superfamily, Member 15 (TNFSF15, Accession NM_005118) is a VGAM1483 host target gene. TNFSF15 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TNFSF15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFSF15 BINDING SITE, designated SEQ ID:11598, to the nucleotide sequence of VGAM1483 RNA, herein designated VGAM RNA, also designated SEQ ID:4194.

[51390] A function of VGAM1483 is therefore inhibition of Tumor Necrosis Factor (ligand) Superfamily, Member 15 (TNFSF15, Accession NM_005118), a gene which acts as an autocrine factor to induce apoptosis in endothelial cells. Accordingly, utilities of VGAM1483 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFSF15. The function of TNFSF15

and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM350. Von Hippel-Lindau Syndrome (VHL, Accession NM_000551) is another VGAM1483 host target gene. VHL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by VHL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VHL BINDING SITE, designated SEQ ID:6156, to the nucleotide sequence of VGAM1483 RNA, herein designated VGAM RNA, also designated SEQ ID:4194.

[51391] Another function of VGAM1483 is therefore inhibition of Von Hippel-Lindau Syndrome (VHL, Accession NM_000551), a gene which may control rna stability through the selective degradation of rna-bound proteins. Accordingly, utilities of VGAM1483 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VHL. The function of VHL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM197.FLJ00060 (Accession

XM_028154) is another VGAM1483 host target gene. FLJ00060 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ00060, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ00060 BINDING SITE, designated SEQ ID:30625, to the nucleotide sequence of VGAM1483 RNA, herein designated VGAM RNA, also designated SEQ ID:4194.

[51392] Another function of VGAM1483 is therefore inhibition of FLJ00060 (Accession XM_028154). Accordingly, utilities of VGAM1483 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00060. KIAA1678 (Accession XM_051221) is another VGAM1483 host target gene. KIAA1678 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1678, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1678 BINDING SITE, designated SEQ ID:35786, to the nucleotide sequence of VGAM1483 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4194.

[51393] Another function of VGAM1483 is therefore inhibition of KIAA1678 (Accession XM_051221). Accordingly, utilities of VGAM1483 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1678. LOC148508 (Accession XM_097478) is another VGAM1483 host target gene. LOC148508 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148508, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148508 BINDING SITE, designated SEQ ID:40884, to the nucleotide sequence of VGAM1483 RNA, herein designated VGAM RNA, also designated SEQ ID:4194.

[51394] Another function of VGAM1483 is therefore inhibition of LOC148508 (Accession XM_097478). Accordingly, utilities of VGAM1483 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148508. LOC222681 (Accession XM_167116) is another VGAM1483 host target gene. LOC222681 BINDING SITE1 through LOC222681 BINDING SITE6 are HOST TARGET binding sites found in untranslated regions of mRNA

encoded by LOC222681, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222681 BINDING SITE1 through LOC222681 BINDING SITE6, designated SEQ ID:44608, SEQ ID:44609, SEQ ID:44610, SEQ ID:44611, SEQ ID:44612 and SEQ ID:44613 respectively, to the nucleotide sequence of VGAM1483 RNA, herein designated VGAM RNA, also designated SEQ ID:4194.

[51395] Another function of VGAM1483 is therefore inhibition of LOC222681 (Accession XM_167116). Accordingly, utilities of VGAM1483 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222681. LOC257507 (Accession XM_175204) is another VGAM1483 host target gene. LOC257507 BINDING SITE1 through LOC257507 BINDING SITE6 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC257507, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257507 BINDING SITE1 through LOC257507 BINDING SITE6, designated SEQ ID:46675, SEQ ID:46676, SEQ ID:46677, SEQ ID:46678,

SEQ ID:46679 and SEQ ID:46730 respectively, to the nucleotide sequence of VGAM1483 RNA, herein designated VGAM RNA, also designated SEQ ID:4194.

[51396] Another function of VGAM1483 is therefore inhibition of LOC257507 (Accession XM_175204). Accordingly, utilities of VGAM1483 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257507. LOC257625 (Accession XM_175267) is another VGAM1483 host target gene. LOC257625 BINDING SITE1 through LOC257625 BINDING SITE6 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC257625, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257625 BINDING SITE1 through LOC257625 BINDING SITE6, designated SEQ ID:46732, SEQ ID:46733, SEQ ID:46734, SEQ ID:46735, SEQ ID:8980 and SEQ ID:21253 respectively, to the nucleotide sequence of VGAM1483 RNA, herein designated VGAM RNA, also designated SEQ ID:4194.

[51397] Another function of VGAM1483 is therefore inhibition of LOC257625 (Accession XM_175267). Accordingly, utilities of VGAM1483 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC257625. DiGeorge Syndrome Critical Region Gene 2 (DGCR2, Accession NM_005137) is another VGAM1485 host target gene. DGCR2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DGCR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DGCR2 BINDING SITE, designated SEQ ID:11611, to the nucleotide sequence of VGAM1485 RNA, herein designated VGAM RNA, also designated SEQ ID:4196.

[51398] Another function of VGAM1485 is therefore inhibition of DiGeorge Syndrome Critical Region Gene 2 (DGCR2, Accession NM_005137), a gene which could intervene in cell-cell or cell-matrix interactions. Accordingly, utilities of VGAM1485 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DGCR2. The function of DGCR2 has been established by previous studies. The DiGeorge syndrome (DGS; 188400) and velocardiofacial syndrome (VCFS; 192430) may present many clinical problems, including cardiac defects, hypoparathyroidism, T-cell immunodeficiency, and facial

dysmorphism. They are frequently associated with deletions within 22q11.2 (accounting in part for the designation CATCH22), but a number of cases have no detectable molecular defect of this region. Daw et al. (1996) stated that a number of single case reports with deletions of 10p suggested genetic heterogeneity of DGS. They compared the regions of hemizygosity in 4 patients with terminal deletions of 10p (1 patient with hypoparathyroidism and 3 with DGS) and 1 patient with VCFS and a large interstitial deletion. Fluorescence in situ hybridization (FISH) analysis demonstrated that these patients had overlapping deletions at the 10p13/10p14 boundary. A YAC contig spanning the shortest region of deletion overlap (SRO) was assembled and allowed the size of the SRO to be approximated to 2 Mb. As with deletions of 22q11, phenotypes varied considerably between affected patients. Daw et al. (1996) concluded that the results strongly support the hypothesis that haploinsufficiency of a gene or genes within 10p (DGS2 locus) can cause the DGS/VCFS spectrum of malformations. Lichtner et al. (2000) reported clinical and molecular deletion analysis of a patient described by Hasegawa et al. (1997) and a new case, both with the HDR phenotype: hypoparathyroidism, deafness, and renal dys-

plasia (OMIM Ref. No. 146255). They were found to have partial monosomy for 10p due to terminal deletions with breakpoints between D10S585 and D10S1720. By comparison with data previously published on patients with DiGeorge/velocardiofacial syndrome associated with 10p monosomy, Lichtner et al. (2000) concluded that this is a contiguous gene syndrome. Hemizygosity for a proximal region can cause cardiac defects and T cell deficiency; hemizygosity for a more distal region can cause hypoparathyroidism, sensorineural deafness, and renal dysplasia.

[51399] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[51400] Daw, S. C. M.; Taylor, C.; Kraman, M.; Call, K.; Mao, J.; Schuffenhauer, S.; Meitinger, T.; Lipson, T.; Goodship, J.; Scambler, P. : A common region of 10p deleted in DiGeorge and velocardiofacial syndromes. *Nature Genet.* 13: 458–461, 1996. ; and

[51401] Lichtner, P.; Konig, R.; Hasegawa, T.; Van Esch, H.; Meitinger, T.; Schuffenhauer, S. : An HDR (hypoparathyroidism, deafness, renal dysplasia) syndrome locus maps distal to the DiGeorg.

[51402] Further studies establishing the function and utilities of DGCR2 are found in John Hopkins OMIM database record ID 601362, and in cited publications numbered 9515–9516, 481 and 9517 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Glutaminase (GLS, Accession NM_014905) is another VGAM1485 host target gene. GLS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GLS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GLS BINDING SITE, designated SEQ ID:17107, to the nucleotide sequence of VGAM1485 RNA, herein designated VGAM RNA, also designated SEQ ID:4196.

[51403] Another function of VGAM1485 is therefore inhibition of Glutaminase (GLS, Accession NM_014905). Accordingly, utilities of VGAM1485 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GLS. Indolethylamine N-methyltransferase (INMT, Accession NM_006774) is another VGAM1485 host target gene. INMT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

INMT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of INMT BINDING SITE, designated SEQ ID:13647, to the nucleotide sequence of VGAM1485 RNA, herein designated VGAM RNA, also designated SEQ ID:4196.

[51404] Another function of VGAM1485 is therefore inhibition of Indolethylamine N-methyltransferase (INMT, Accession NM_006774). Accordingly, utilities of VGAM1485 include diagnosis, prevention and treatment of diseases and clinical conditions associated with INMT. Protein Phosphatase 1, Regulatory (inhibitor) Subunit 12B (PPP1R12B, Accession NM_032104) is another VGAM1485 host target gene. PPP1R12B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPP1R12B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R12B BINDING SITE, designated SEQ ID:25795, to the nucleotide sequence of VGAM1485 RNA, herein designated VGAM RNA, also designated SEQ ID:4196.

[51405] Another function of VGAM1485 is therefore inhibition of

Protein Phosphatase 1, Regulatory (inhibitor) Subunit 12B (PPP1R12B, Accession NM_032104). Accordingly, utilities of VGAM1485 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R12B. Signal Transducing Adaptor Molecule (SH3 domain and ITAM motif) 1 (STAM, Accession NM_003473) is another VGAM1485 host target gene. STAM BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STAM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STAM BINDING SITE, designated SEQ ID:9540, to the nucleotide sequence of VGAM1485 RNA, herein designated VGAM RNA, also designated SEQ ID:4196.

[51406] Another function of VGAM1485 is therefore inhibition of Signal Transducing Adaptor Molecule (SH3 domain and ITAM motif) 1 (STAM, Accession NM_003473), a gene which is as an adaptor molecule involved in the downstream signaling of cytokine receptors. Accordingly, utilities of VGAM1485 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STAM. The function of STAM and its association with

various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM927.WTAP (Accession NM_004906) is another VGAM1485 host target gene. WTAP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by WTAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WTAP BINDING SITE, designated SEQ ID:11343, to the nucleotide sequence of VGAM1485 RNA, herein designated VGAM RNA, also designated SEQ ID:4196.

[51407] Another function of VGAM1485 is therefore inhibition of WTAP (Accession NM_004906), a gene which plays a role in both transcriptional and posttranscriptional regulation of certain cellular genes. Accordingly, utilities of VGAM1485 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WTAP. The function of WTAP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM874.KIAA0121 (Accession XM_052386) is another VGAM1485 host target gene. KIAA0121 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0121, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0121 BINDING SITE, designated SEQ ID:35966, to the nucleotide sequence of VGAM1485 RNA, herein designated VGAM RNA, also designated SEQ ID:4196.

[51408] Another function of VGAM1485 is therefore inhibition of KIAA0121 (Accession XM_052386). Accordingly, utilities of VGAM1485 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0121. KIAA0546 (Accession XM_049055) is another VGAM1485 host target gene. KIAA0546 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0546, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0546 BINDING SITE, designated SEQ ID:35328, to the nucleotide sequence of VGAM1485 RNA, herein designated VGAM RNA, also designated SEQ ID:4196.

[51409] Another function of VGAM1485 is therefore inhibition of

KIAA0546 (Accession XM_049055). Accordingly, utilities of VGAM1485 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0546. KIAA0903 (Accession XM_049251) is another VGAM1485 host target gene. KIAA0903 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0903, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0903 BINDING SITE, designated SEQ ID:35368, to the nucleotide sequence of VGAM1485 RNA, herein designated VGAM RNA, also designated SEQ ID:4196.

[51410] Another function of VGAM1485 is therefore inhibition of KIAA0903 (Accession XM_049251). Accordingly, utilities of VGAM1485 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0903. KIAA1580 (Accession XM_045271) is another VGAM1485 host target gene. KIAA1580 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1580, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1580 BINDING SITE, designated SEQ ID:34406, to the nucleotide sequence of VGAM1485 RNA, herein designated VGAM RNA, also designated SEQ ID:4196.

[51411] Another function of VGAM1485 is therefore inhibition of KIAA1580 (Accession XM_045271). Accordingly, utilities of VGAM1485 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1580. LOC131000 (Accession XM_067145) is another VGAM1485 host target gene. LOC131000 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC131000, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC131000 BINDING SITE, designated SEQ ID:37348, to the nucleotide sequence of VGAM1485 RNA, herein designated VGAM RNA, also designated SEQ ID:4196.

[51412] Another function of VGAM1485 is therefore inhibition of LOC131000 (Accession XM_067145). Accordingly, utilities of VGAM1485 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC131000. LOC158434 (Accession XM_098939) is an-

other VGAM1485 host target gene. LOC158434 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158434, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158434 BINDING SITE, designated SEQ ID:41982, to the nucleotide sequence of VGAM1485 RNA, herein designated VGAM RNA, also designated SEQ ID:4196.

[51413] Another function of VGAM1485 is therefore inhibition of LOC158434 (Accession XM_098939). Accordingly, utilities of VGAM1485 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158434. LOC90643 (Accession XM_033145) is another VGAM1485 host target gene. LOC90643 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90643, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90643 BINDING SITE, designated SEQ ID:31851, to the nucleotide sequence of VGAM1485 RNA, herein designated VGAM RNA, also designated SEQ ID:4196.

[51414] Another function of VGAM1485 is therefore inhibition of LOC90643 (Accession XM_033145). Accordingly, utilities of VGAM1485 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90643. LOC91813 (Accession XM_040862) is another VGAM1485 host target gene. LOC91813 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91813, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91813 BINDING SITE, designated SEQ ID:33395, to the nucleotide sequence of VGAM1485 RNA, herein designated VGAM RNA, also designated SEQ ID:4196.

[51415] Another function of VGAM1485 is therefore inhibition of LOC91813 (Accession XM_040862). Accordingly, utilities of VGAM1485 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91813. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1486 (VGAM1486) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[51416] VGAM1486 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1486 was detected is described hereinabove with reference to Figs. 1–8.

[51417] VGAM1486 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid Herpesvirus 2. VGAM1486 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51418] VGAM1486 gene encodes a VGAM1486 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1486 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1486 precursor RNA is designated SEQ ID:1472, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1472 is located at position 82050 relative to the genome of Gallid Herpesvirus 2.

[51419] VGAM1486 precursor RNA folds onto itself, forming VGAM1486 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51420] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1486 folded precursor RNA into VGAM1486 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM1486 RNA is designated SEQ ID:4197, and is provided hereinbelow with reference to the sequence listing part.

[51421] VGAM1486 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1486 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1486 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[51422] VGAM1486 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1486 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1486 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1486 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1486 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[51423] The complementary binding of VGAM1486 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1486 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1486 host target RNA into VGAM1486 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51424] It is appreciated that VGAM1486 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1486 host target genes. The mRNA of each one of this plurality of VGAM1486 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1486 RNA, herein designated VGAM RNA, and which when bound by VGAM1486 RNA causes inhibition of translation of respective one or more VGAM1486 host target proteins.

[51425] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1486 gene, herein designated VGAM GENE, on one or more VGAM1486 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[51426] It is yet further appreciated that a function of VGAM1486 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1486 include diagnosis, prevention and treatment of viral infection by Gallid Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1486 correlate with, and may be deduced from, the identity of the host target genes which VGAM1486 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[51427] Nucleotide sequences of the VGAM1486 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1486 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1486 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1486 are further described hereinbelow with reference to Table 1.

[51428] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1486 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1486 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51429] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1486 gene, herein designated VGAM is inhibition of expression of VGAM1486 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1486 correlate with, and may be deduced from, the identity of the target genes which VGAM1486 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[51430] Promyelocytic Leukemia (PML, Accession NM_033238) is a VGAM1486 host target gene. PML BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PML, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PML BINDING SITE, designated SEQ ID:27077, to the nucleotide sequence of VGAM1486 RNA, herein designated VGAM RNA, also designated SEQ ID:4197.

[51431] A function of VGAM1486 is therefore inhibition of Promyelocytic Leukemia (PML, Accession NM_033238). Accordingly, utilities of VGAM1486 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PML. Zinc Finger Protein 192 (ZNF192, Accession NM_006298) is another VGAM1486 host target gene. ZNF192 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF192, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF192 BINDING SITE, designated SEQ ID:12987, to the nucleotide sequence of

VGAM1486 RNA, herein designated VGAM RNA, also designated SEQ ID:4197.

[51432] Another function of VGAM1486 is therefore inhibition of Zinc Finger Protein 192 (ZNF192, Accession NM_006298). Accordingly, utilities of VGAM1486 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF192. MGC14161 (Accession NM_032892) is another VGAM1486 host target gene. MGC14161 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC14161, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC14161 BINDING SITE, designated SEQ ID:26721, to the nucleotide sequence of VGAM1486 RNA, herein designated VGAM RNA, also designated SEQ ID:4197.

[51433] Another function of VGAM1486 is therefore inhibition of MGC14161 (Accession NM_032892). Accordingly, utilities of VGAM1486 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC14161. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 1487 (VGAM1487) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51434] VGAM1487 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1487 was detected is described hereinabove with reference to Figs. 1–8.

[51435] VGAM1487 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid Herpesvirus 2. VGAM1487 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51436] VGAM1487 gene encodes a VGAM1487 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1487 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1487 precursor RNA is designated SEQ ID:1473, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1473 is located at position 80281 relative to the

genome of Gallid Herpesvirus 2.

[51437] VGAM1487 precursor RNA folds onto itself, forming VGAM1487 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51438] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1487 folded precursor RNA into VGAM1487 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1487 RNA is designated SEQ ID:4198, and is provided hereinbelow with reference to the sequence listing part.

[51439] VGAM1487 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1487 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1487 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[51440] VGAM1487 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1487 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1487 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1487 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1487 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[51441] The complementary binding of VGAM1487 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1487 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1487 host target RNA into VGAM1487 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51442] It is appreciated that VGAM1487 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1487 host target genes. The mRNA of each one of this plurality of VGAM1487 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1487 RNA, herein designated VGAM RNA, and which when bound by VGAM1487 RNA causes inhibition of translation of respective one or more VGAM1487 host target proteins.

[51443] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1487 gene, herein designated VGAM GENE, on one or more VGAM1487 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[51444] It is yet further appreciated that a function of VGAM1487 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1487 include diagnosis, prevention and treatment of viral infection by Gallid Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1487

correlate with, and may be deduced from, the identity of the host target genes which VGAM1487 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51445] Nucleotide sequences of the VGAM1487 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1487 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1487 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1487 are further described hereinbelow with reference to Table 1.

[51446] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1487 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1487 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51447] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1487 gene, herein designated VGAM is inhibition of expression of VGAM1487 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1487 correlate with, and may be deduced

from, the identity of the target genes which VGAM1487 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[51448] Development and Differentiation Enhancing Factor 2 (DDEF2, Accession NM_003887) is a VGAM1487 host target gene. DDEF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DDEF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDEF2 BINDING SITE, designated SEQ ID:9965, to the nucleotide sequence of VGAM1487 RNA, herein designated VGAM RNA, also designated SEQ ID:4198.

[51449] A function of VGAM1487 is therefore inhibition of Development and Differentiation Enhancing Factor 2 (DDEF2, Accession NM_003887), a gene which interacts with members of the Arf and Src family. Accordingly, utilities of VGAM1487 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDEF2. The function of DDEF2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to VGAM464. Protein Tyrosine Phosphatase, Receptor Type, O (PTPRO, Accession NM_002848) is another VGAM1487 host target gene. PTPRO BINDING SITE1 through PTPRO BINDING SITE5 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PTPRO, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPRO BINDING SITE1 through PTPRO BINDING SITE5, designated SEQ ID:8738, SEQ ID:25018, SEQ ID:25027, SEQ ID:25003 and SEQ ID:25009 respectively, to the nucleotide sequence of VGAM1487 RNA, herein designated VGAM RNA, also designated SEQ ID:4198.

[51450] Another function of VGAM1487 is therefore inhibition of Protein Tyrosine Phosphatase, Receptor Type, O (PTPRO, Accession NM_002848), a gene which may function as a cell contact receptor that mediates and controls cell-cell signals. Accordingly, utilities of VGAM1487 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPRO. The function of PTPRO and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM140.DKFZp762K2015 (Accession XM_051791) is another VGAM1487 host target gene. DKFZp762K2015 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp762K2015, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp762K2015 BINDING SITE, designated SEQ ID:35883, to the nucleotide sequence of VGAM1487 RNA, herein designated VGAM RNA, also designated SEQ ID:4198.

[51451] Another function of VGAM1487 is therefore inhibition of DKFZp762K2015 (Accession XM_051791). Accordingly, utilities of VGAM1487 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp762K2015. FLJ21290 (Accession NM_025034) is another VGAM1487 host target gene. FLJ21290 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21290, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21290 BINDING SITE, designated SEQ ID:24631, to the

nucleotide sequence of VGAM1487 RNA, herein designated VGAM RNA, also designated SEQ ID:4198.

[51452] Another function of VGAM1487 is therefore inhibition of FLJ21290 (Accession NM_025034). Accordingly, utilities of VGAM1487 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21290. IPLA2(GAMMA) (Accession XM_027224) is another VGAM1487 host target gene. IPLA2(GAMMA) BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by IPLA2(GAMMA), corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IPLA2(GAMMA) BINDING SITE, designated SEQ ID:30443, to the nucleotide sequence of VGAM1487 RNA, herein designated VGAM RNA, also designated SEQ ID:4198.

[51453] Another function of VGAM1487 is therefore inhibition of IPLA2(GAMMA) (Accession XM_027224). Accordingly, utilities of VGAM1487 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IPLA2(GAMMA). MGC11349 (Accession NM_025112) is another VGAM1487 host target gene. MGC11349 BIND-

ING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC11349, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC11349 BINDING SITE, designated SEQ ID:24759, to the nucleotide sequence of VGAM1487 RNA, herein designated VGAM RNA, also designated SEQ ID:4198.

[51454] Another function of VGAM1487 is therefore inhibition of MGC11349 (Accession NM_025112). Accordingly, utilities of VGAM1487 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC11349. LOC219686 (Accession XM_165544) is another VGAM1487 host target gene. LOC219686 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC219686, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219686 BINDING SITE, designated SEQ ID:43672, to the nucleotide sequence of VGAM1487 RNA, herein designated VGAM RNA, also designated SEQ ID:4198.

[51455] Another function of VGAM1487 is therefore inhibition of

LOC219686 (Accession XM_165544). Accordingly, utilities of VGAM1487 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219686. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1488 (VGAM1488) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51456] VGAM1488 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1488 was detected is described hereinabove with reference to Figs. 1-8.

[51457] VGAM1488 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Plum Pox Virus.

VGAM1488 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51458] VGAM1488 gene encodes a VGAM1488 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1488 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1488 precursor RNA is designated SEQ ID:1474, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1474 is located at position 7567 relative to the genome of Plum Pox Virus.

- [51459] VGAM1488 precursor RNA folds onto itself, forming VGAM1488 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [51460] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1488 folded precursor RNA into VGAM1488 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide se-

quence of VGAM1488 RNA is designated SEQ ID:4199, and is provided hereinbelow with reference to the sequence listing part.

[51461] VGAM1488 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1488 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1488 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[51462] VGAM1488 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1488 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1488 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM1488 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1488 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[51463] The complementary binding of VGAM1488 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1488 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1488 host target RNA into VGAM1488 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51464] It is appreciated that VGAM1488 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1488 host target genes. The mRNA of each one of this plurality of VGAM1488 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1488 RNA, herein designated VGAM RNA, and which when bound by VGAM1488 RNA causes inhibition of translation of respective one or more VGAM1488 host target proteins.

[51465] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1488 gene, herein designated VGAM GENE, on one or more VGAM1488 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[51466] It is yet further appreciated that a function of VGAM1488

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1488 include diagnosis, prevention and treatment of viral infection by Plum Pox Virus. Specific functions, and accordingly utilities, of VGAM1488 correlate with, and may be deduced from, the identity of the host target genes which VGAM1488 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51467] Nucleotide sequences of the VGAM1488 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1488 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1488 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1488 are further described hereinbelow with reference to Table 1.

[51468] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1488 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1488 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51469] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1488 gene, herein designated VGAM is inhibition of expression of VGAM1488 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1488 correlate with, and may be deduced from, the identity of the target genes which VGAM1488 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[51470] A Kinase (PRKA) Anchor Protein 1 (AKAP1, Accession NM_139275) is a VGAM1488 host target gene. AKAP1 BINDING SITE1 and AKAP1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by AKAP1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AKAP1 BINDING SITE1 and AKAP1 BINDING SITE2, designated SEQ ID:29267 and SEQ ID:9581 respectively, to the nucleotide sequence of VGAM1488 RNA, herein designated VGAM RNA, also designated SEQ ID:4199.

[51471] A function of VGAM1488 is therefore inhibition of A Kinase (PRKA) Anchor Protein 1 (AKAP1, Accession NM_139275), a gene which binds to type i and ii regula-

tory subunits of protein kinase a . Accordingly, utilities of VGAM1488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKAP1. The function of AKAP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1392.Cysteine-rich, Angiogenic Inducer, 61 (CYR61, Accession NM_001554) is another VGAM1488 host target gene. CYR61 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CYR61, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYR61 BINDING SITE, designated SEQ ID:7277, to the nucleotide sequence of VGAM1488 RNA, herein designated VGAM RNA, also designated SEQ ID:4199.

[51472] Another function of VGAM1488 is therefore inhibition of Cysteine-rich, Angiogenic Inducer, 61 (CYR61, Accession NM_001554), a gene which promotes the adhesion of endothelial cells . Accordingly, utilities of VGAM1488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYR61. The function of

CYR61 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1229.F-box and Leucine-rich Repeat Protein 3A (FBXL3A, Accession NM_012158) is another VGAM1488 host target gene. FBXL3A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FBXL3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBXL3A BINDING SITE, designated SEQ ID:14457, to the nucleotide sequence of VGAM1488 RNA, herein designated VGAM RNA, also designated SEQ ID:4199.

[51473] Another function of VGAM1488 is therefore inhibition of F-box and Leucine-rich Repeat Protein 3A (FBXL3A, Accession NM_012158), a gene which is a putative SCF ubiquitin ligase subunit involved in protein degradation. Accordingly, utilities of VGAM1488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXL3A. The function of FBXL3A and its association with various diseases and clinical conditions, has been established by previous studies, as described

hereinabove with reference to VGAM1172.Roundabout, Axon Guidance Receptor, Homolog 1 (Drosophila) (ROBO1, Accession NM_002941) is another VGAM1488 host target gene. ROBO1 BINDING SITE1 and ROBO1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ROBO1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ROBO1 BINDING SITE1 and ROBO1 BINDING SITE2, designated SEQ ID:8847 and SEQ ID:28582 respectively, to the nucleotide sequence of VGAM1488 RNA, herein designated VGAM RNA, also designated SEQ ID:4199.

[51474] Another function of VGAM1488 is therefore inhibition of Roundabout, Axon Guidance Receptor, Homolog 1 (Drosophila) (ROBO1, Accession NM_002941), a gene which is an axon guidance receptor. Accordingly, utilities of VGAM1488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ROBO1. The function of ROBO1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM37.T-complex-associated-testis-expressed 1-like (TCTE1L, Accession XM_048205) is another VGAM1488 host target gene. TCTE1L BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TCTE1L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCTE1L BINDING SITE, designated SEQ ID:35144, to the nucleotide sequence of VGAM1488 RNA, herein designated VGAM RNA, also designated SEQ ID:4199.

[51475] Another function of VGAM1488 is therefore inhibition of T-complex-associated-testis-expressed 1-like (TCTE1L, Accession XM_048205). Accordingly, utilities of VGAM1488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCTE1L. Adaptor-related Protein Complex 1, Sigma 2 Subunit (AP1S2, Accession NM_003916) is another VGAM1488 host target gene. AP1S2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AP1S2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of AP1S2 BINDING SITE, designated SEQ ID:10004, to the nucleotide sequence of VGAM1488 RNA, herein designated VGAM RNA, also designated SEQ ID:4199.

[51476] Another function of VGAM1488 is therefore inhibition of Adaptor-related Protein Complex 1, Sigma 2 Subunit (AP1S2, Accession NM_003916). Accordingly, utilities of VGAM1488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP1S2. Apoptosis Inhibitor 5 (API5, Accession NM_006595) is another VGAM1488 host target gene. API5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by API5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of API5 BINDING SITE, designated SEQ ID:13364, to the nucleotide sequence of VGAM1488 RNA, herein designated VGAM RNA, also designated SEQ ID:4199.

[51477] Another function of VGAM1488 is therefore inhibition of Apoptosis Inhibitor 5 (API5, Accession NM_006595). Accordingly, utilities of VGAM1488 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with API5. CGI-57 (Accession XM_058098) is another VGAM1488 host target gene. CGI-57 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CGI-57, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CGI-57 BINDING SITE, designated SEQ ID:36575, to the nucleotide sequence of VGAM1488 RNA, herein designated VGAM RNA, also designated SEQ ID:4199.

[51478] Another function of VGAM1488 is therefore inhibition of CGI-57 (Accession XM_058098). Accordingly, utilities of VGAM1488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CGI-57. DKFZp434A2417 (Accession XM_038526) is another VGAM1488 host target gene. DKFZp434A2417 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp434A2417, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434A2417 BINDING SITE, designated SEQ ID:32864, to the nucleotide sequence of VGAM1488

RNA, herein designated VGAM RNA, also designated SEQ ID:4199.

[51479] Another function of VGAM1488 is therefore inhibition of DKFZp434A2417 (Accession XM_038526). Accordingly, utilities of VGAM1488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434A2417. FLJ12488 (Accession NM_031218) is another VGAM1488 host target gene. FLJ12488 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12488, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12488 BINDING SITE, designated SEQ ID:25265, to the nucleotide sequence of VGAM1488 RNA, herein designated VGAM RNA, also designated SEQ ID:4199.

[51480] Another function of VGAM1488 is therefore inhibition of FLJ12488 (Accession NM_031218). Accordingly, utilities of VGAM1488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12488. KIAA0633 (Accession XM_168380) is another VGAM1488 host target gene. KIAA0633 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA0633, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0633 BINDING SITE, designated SEQ ID:45142, to the nucleotide sequence of VGAM1488 RNA, herein designated VGAM RNA, also designated SEQ ID:4199.

[51481] Another function of VGAM1488 is therefore inhibition of KIAA0633 (Accession XM_168380). Accordingly, utilities of VGAM1488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0633. KIAA0794 (Accession XM_087353) is another VGAM1488 host target gene. KIAA0794 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0794, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0794 BINDING SITE, designated SEQ ID:39188, to the nucleotide sequence of VGAM1488 RNA, herein designated VGAM RNA, also designated SEQ ID:4199.

[51482] Another function of VGAM1488 is therefore inhibition of KIAA0794 (Accession XM_087353). Accordingly, utilities

of VGAM1488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0794. KIAA0924 (Accession NM_014897) is another VGAM1488 host target gene. KIAA0924 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0924, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0924 BINDING SITE, designated SEQ ID:17068, to the nucleotide sequence of VGAM1488 RNA, herein designated VGAM RNA, also designated SEQ ID:4199.

[51483] Another function of VGAM1488 is therefore inhibition of KIAA0924 (Accession NM_014897). Accordingly, utilities of VGAM1488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0924. KIAA1430 (Accession XM_087593) is another VGAM1488 host target gene. KIAA1430 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1430, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA1430 BINDING SITE, designated SEQ ID:39359, to the nucleotide sequence of VGAM1488 RNA, herein designated VGAM RNA, also designated SEQ ID:4199.

[51484] Another function of VGAM1488 is therefore inhibition of KIAA1430 (Accession XM_087593). Accordingly, utilities of VGAM1488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1430. KIAA1495 (Accession XM_055080) is another VGAM1488 host target gene. KIAA1495 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1495, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1495 BINDING SITE, designated SEQ ID:36226, to the nucleotide sequence of VGAM1488 RNA, herein designated VGAM RNA, also designated SEQ ID:4199.

[51485] Another function of VGAM1488 is therefore inhibition of KIAA1495 (Accession XM_055080). Accordingly, utilities of VGAM1488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1495. PGR1 (Accession NM_033296) is another VGAM1488 host target gene. PGR1 BINDING SITE is HOST

TARGET binding site found in the 3` untranslated region of mRNA encoded by PGR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PGR1 BINDING SITE, designated SEQ ID:27125, to the nucleotide sequence of VGAM1488 RNA, herein designated VGAM RNA, also designated SEQ ID:4199.

[51486] Another function of VGAM1488 is therefore inhibition of PGR1 (Accession NM_033296). Accordingly, utilities of VGAM1488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PGR1. PRO1635 (Accession NM_018589) is another VGAM1488 host target gene. PRO1635 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRO1635, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1635 BINDING SITE, designated SEQ ID:20668, to the nucleotide sequence of VGAM1488 RNA, herein designated VGAM RNA, also designated SEQ ID:4199.

[51487] Another function of VGAM1488 is therefore inhibition of

PRO1635 (Accession NM_018589). Accordingly, utilities of VGAM1488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1635. SMAP1 (Accession NM_021940) is another VGAM1488 host target gene. SMAP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SMAP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMAP1 BINDING SITE, designated SEQ ID:22456, to the nucleotide sequence of VGAM1488 RNA, herein designated VGAM RNA, also designated SEQ ID:4199.

[51488] Another function of VGAM1488 is therefore inhibition of SMAP1 (Accession NM_021940). Accordingly, utilities of VGAM1488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMAP1. LOC158427 (Accession NM_139246) is another VGAM1488 host target gene. LOC158427 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158427, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC158427 BINDING SITE, designated SEQ ID:29245, to the nucleotide sequence of VGAM1488 RNA, herein designated VGAM RNA, also designated SEQ ID:4199.

[51489] Another function of VGAM1488 is therefore inhibition of LOC158427 (Accession NM_139246). Accordingly, utilities of VGAM1488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158427. LOC163231 (Accession XM_092094) is another VGAM1488 host target gene. LOC163231 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC163231, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC163231 BINDING SITE, designated SEQ ID:40097, to the nucleotide sequence of VGAM1488 RNA, herein designated VGAM RNA, also designated SEQ ID:4199.

[51490] Another function of VGAM1488 is therefore inhibition of LOC163231 (Accession XM_092094). Accordingly, utilities of VGAM1488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC163231. LOC205251 (Accession XM_119554) is an-

other VGAM1488 host target gene. LOC205251 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC205251, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC205251 BINDING SITE, designated SEQ ID:43588, to the nucleotide sequence of VGAM1488 RNA, herein designated VGAM RNA, also designated SEQ ID:4199.

[51491] Another function of VGAM1488 is therefore inhibition of LOC205251 (Accession XM_119554). Accordingly, utilities of VGAM1488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC205251. LOC220018 (Accession XM_167816) is another VGAM1488 host target gene. LOC220018 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220018, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220018 BINDING SITE, designated SEQ ID:44858, to the nucleotide sequence of VGAM1488 RNA, herein designated VGAM RNA, also designated SEQ ID:4199.

[51492] Another function of VGAM1488 is therefore inhibition of LOC220018 (Accession XM_167816). Accordingly, utilities of VGAM1488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220018. LOC51336 (Accession NM_016646) is another VGAM1488 host target gene. LOC51336 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC51336, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51336 BINDING SITE, designated SEQ ID:18759, to the nucleotide sequence of VGAM1488 RNA, herein designated VGAM RNA, also designated SEQ ID:4199.

[51493] Another function of VGAM1488 is therefore inhibition of LOC51336 (Accession NM_016646). Accordingly, utilities of VGAM1488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51336. LOC91266 (Accession XM_037268) is another VGAM1488 host target gene. LOC91266 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC91266, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91266 BINDING SITE, designated SEQ ID:32603, to the nucleotide sequence of VGAM1488 RNA, herein designated VGAM RNA, also designated SEQ ID:4199.

[51494] Another function of VGAM1488 is therefore inhibition of LOC91266 (Accession XM_037268). Accordingly, utilities of VGAM1488 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91266. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1489 (VGAM1489) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51495] VGAM1489 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1489 was detected is described hereinabove with reference to Figs. 1-8.

[51496] VGAM1489 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Plum Pox Virus. VGAM1489 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[51497] VGAM1489 gene encodes a VGAM1489 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1489 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1489 precursor RNA is designated SEQ ID:1475, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1475 is located at position 8790 relative to the genome of Plum Pox Virus.

[51498] VGAM1489 precursor RNA folds onto itself, forming VGAM1489 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51499] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1489 folded precursor RNA into VGAM1489

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of VGAM1489 RNA is designated SEQ ID:4200, and is provided hereinbelow with reference to the sequence listing part.

[51500] VGAM1489 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1489 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1489 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[51501] VGAM1489 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1489 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1489 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1489 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1489 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[51502] The complementary binding of VGAM1489 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1489 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1489 host target RNA into VGAM1489 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[51503] It is appreciated that VGAM1489 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1489 host target genes. The mRNA of each one of this plurality of VGAM1489 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1489 RNA, herein designated VGAM RNA, and which when bound by VGAM1489 RNA causes inhibition of translation of respective one or more VGAM1489 host target proteins.

[51504] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1489 gene, herein designated VGAM GENE, on one or more VGAM1489 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[51505] It is yet further appreciated that a function of VGAM1489 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1489 include diagnosis, prevention and treatment of viral infection by Plum Pox Virus. Specific functions, and accordingly utilities, of VGAM1489 correlate with, and may be deduced from, the identity of the host target genes which VGAM1489 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51506] Nucleotide sequences of the VGAM1489 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1489 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1489 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1489 are further described hereinbelow with reference to Table 1.

[51507] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1489 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1489 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51508] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1489 gene, herein designated VGAM is inhibition of expression of VGAM1489 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1489 correlate with, and may be deduced from, the identity of the target genes which VGAM1489 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[51509] IL2-inducible T-cell Kinase (ITK, Accession NM_005546) is a VGAM1489 host target gene. ITK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ITK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITK BINDING SITE, designated SEQ ID:12077, to the nucleotide sequence of VGAM1489 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4200.

[51510] A function of VGAM1489 is therefore inhibition of IL2-inducible T-cell Kinase (ITK, Accession NM_005546), a gene which plays a role in t cell proliferation and differentiation. Accordingly, utilities of VGAM1489 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITK. The function of ITK and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM288. Keratin, Hair, Acidic, 8 (KRTHA8, Accession NM_006771) is another VGAM1489 host target gene. KRTHA8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KRTHA8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KRTHA8 BINDING SITE, designated SEQ ID:13645, to the nucleotide sequence of VGAM1489 RNA, herein designated VGAM RNA, also designated SEQ ID:4200.

[51511] Another function of VGAM1489 is therefore inhibition of Keratin, Hair, Acidic, 8 (KRTHA8, Accession NM_006771), a gene which a type I keratin that may form intermediate

filaments. Accordingly, utilities of VGAM1489 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KRTHA8. The function of KRTHA8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM910. TEM8 (Accession NM_032208) is another VGAM1489 host target gene. TEM8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TEM8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TEM8 BINDING SITE, designated SEQ ID:25918, to the nucleotide sequence of VGAM1489 RNA, herein designated VGAM RNA, also designated SEQ ID:4200.

[51512] Another function of VGAM1489 is therefore inhibition of TEM8 (Accession NM_032208), a gene which is a tumor-specific endothelial marker. Accordingly, utilities of VGAM1489 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TEM8. The function of TEM8 has been established by previous studies. St. Croix et al. (2000) compared gene expression

patterns of endothelial cells derived from blood vessels of normal and malignant colorectal tissues to identify genes involved in tumor angiogenesis. Among the genes they identified was TEM8, which encodes a 564-amino acid protein. Bradley et al. (2001) isolated a cDNA encoding ATR and determined that the first 364 amino acids of the 368-amino acid ATR protein are identical to those of TEM8. The C-terminal ends of the ATR and TEM8 proteins then diverge, presumably due to alternative splicing, such that ATR has a cytoplasmic tail of only 25 amino acids, whereas TEM8 has a cytoplasmic tail of 221 amino acids. (Bradley et al. (2001) noted in proof that another apparently full-length ATR/TEM8-related cDNA clone (GenBank BC01207) encodes a protein with yet another C-terminal end.) The ATR protein contains a 27-amino acid signal peptide; a 293-amino acid extracellular domain with 3 putative end-length glycosylation sites; and a 23-amino acid putative transmembrane region followed by the short cytoplasmic tail. An extracellular von Willebrand factor type A (VWA) domain is located between residues 44 and 216 of the ATR protein. The cytoplasmic tail of ATR contains an acidic cluster (EESEE) similar to a motif in the cytoplasmic tail of furin (OMIM Ref. No. 136950) that speci-

fies basolateral sorting of this protease in polarized epithelial cells. The mouse homolog of ATR/TEM8 is highly related to the human clones, showing more than 98% sequence identity in the extracellular domain. ATR and/or TEM8 is expressed in a number of different tissues, including central nervous system, heart, lung, and lymphocytes. Bradley et al. (2001) confirmed that the VWA domain of ATR binds directly to the protective antigen of anthrax, suggesting that ATR may also function as a protective antigen receptor. They suggested that the finding that the soluble VWA domain of ATR inhibits toxin action, coupled with the use of the cloned receptor as a tool for identifying inhibitors of the protective antigen-receptor interaction, holds promise for the development of novel approaches for the treatment of anthrax.

[51513] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[51514] St. Croix, B.; Rago, C.; Velculescu, V.; Traverso, G.; Romans, K. E.; Montgomery, E.; Lal, A.; Riggins, G. J.; Lengauer, C.; Vogelstein, B.; Kinzler, K. W. : Genes expressed in human tumor endothelium. Science 289: 1197-1202, 2000. ; and

- [51515] Bradley, K. A.; Mogridge, J.; Mourez, M.; Collier, R. J.; Young, J. A. T. : Identification of the cellular receptor for anthrax toxin. *Nature* 414: 160–161, 2001.
- [51516] Further studies establishing the function and utilities of TEM8 are found in John Hopkins OMIM database record ID 606410, and in cited publications numbered 4533, 689 and 6907 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. BC022889 (Accession XM_096964) is another VGAM1489 host target gene. BC022889 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BC022889, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BC022889 BINDING SITE, designated SEQ ID:40684, to the nucleotide sequence of VGAM1489 RNA, herein designated VGAM RNA, also designated SEQ ID:4200.
- [51517] Another function of VGAM1489 is therefore inhibition of BC022889 (Accession XM_096964). Accordingly, utilities of VGAM1489 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BC022889. FLJ20546 (Accession NM_017872) is another

VGAM1489 host target gene. FLJ20546 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20546, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20546 BINDING SITE, designated SEQ ID:19544, to the nucleotide sequence of VGAM1489 RNA, herein designated VGAM RNA, also designated SEQ ID:4200.

[51518] Another function of VGAM1489 is therefore inhibition of FLJ20546 (Accession NM_017872). Accordingly, utilities of VGAM1489 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20546. FLJ20671 (Accession NM_017924) is another VGAM1489 host target gene. FLJ20671 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20671, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20671 BINDING SITE, designated SEQ ID:19592, to the nucleotide sequence of VGAM1489 RNA, herein designated VGAM RNA, also designated SEQ ID:4200.

[51519] Another function of VGAM1489 is therefore inhibition of FLJ20671 (Accession NM_017924). Accordingly, utilities of VGAM1489 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20671. FLJ23121 (Accession NM_024694) is another VGAM1489 host target gene. FLJ23121 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23121, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23121 BINDING SITE, designated SEQ ID:24002, to the nucleotide sequence of VGAM1489 RNA, herein designated VGAM RNA, also designated SEQ ID:4200.

[51520] Another function of VGAM1489 is therefore inhibition of FLJ23121 (Accession NM_024694). Accordingly, utilities of VGAM1489 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23121. KIAA1877 (Accession XM_038616) is another VGAM1489 host target gene. KIAA1877 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1877, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1877 BINDING SITE, designated SEQ ID:32882, to the nucleotide sequence of VGAM1489 RNA, herein designated VGAM RNA, also designated SEQ ID:4200.

[51521] Another function of VGAM1489 is therefore inhibition of KIAA1877 (Accession XM_038616). Accordingly, utilities of VGAM1489 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1877. MGC20470 (Accession NM_145053) is another VGAM1489 host target gene. MGC20470 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC20470, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC20470 BINDING SITE, designated SEQ ID:29686, to the nucleotide sequence of VGAM1489 RNA, herein designated VGAM RNA, also designated SEQ ID:4200.

[51522] Another function of VGAM1489 is therefore inhibition of MGC20470 (Accession NM_145053). Accordingly, utilities of VGAM1489 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

MGC20470. MGC4400 (Accession NM_032679) is another VGAM1489 host target gene. MGC4400 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC4400, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4400 BINDING SITE, designated SEQ ID:26400, to the nucleotide sequence of VGAM1489 RNA, herein designated VGAM RNA, also designated SEQ ID:4200.

[51523] Another function of VGAM1489 is therefore inhibition of MGC4400 (Accession NM_032679). Accordingly, utilities of VGAM1489 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4400. NLI-IF (Accession NM_021198) is another VGAM1489 host target gene. NLI-IF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NLI-IF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NLI-IF BINDING SITE, designated SEQ ID:22174, to the nucleotide sequence of VGAM1489 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4200.

[51524] Another function of VGAM1489 is therefore inhibition of NLI-IF (Accession NM_021198). Accordingly, utilities of VGAM1489 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NLI-IF. Spir-2 (Accession XM_047462) is another VGAM1489 host target gene. Spir-2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by Spir-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Spir-2 BINDING SITE, designated SEQ ID:34964, to the nucleotide sequence of VGAM1489 RNA, herein designated VGAM RNA, also designated SEQ ID:4200.

[51525] Another function of VGAM1489 is therefore inhibition of Spir-2 (Accession XM_047462). Accordingly, utilities of VGAM1489 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Spir-2. LOC120856 (Accession XM_058509) is another VGAM1489 host target gene. LOC120856 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC120856, corresponding

to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC120856 BINDING SITE, designated SEQ ID:36640, to the nucleotide sequence of VGAM1489 RNA, herein designated VGAM RNA, also designated SEQ ID:4200.

[51526] Another function of VGAM1489 is therefore inhibition of LOC120856 (Accession XM_058509). Accordingly, utilities of VGAM1489 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC120856. LOC143916 (Accession XM_084664) is another VGAM1489 host target gene. LOC143916 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC143916, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143916 BINDING SITE, designated SEQ ID:37651, to the nucleotide sequence of VGAM1489 RNA, herein designated VGAM RNA, also designated SEQ ID:4200.

[51527] Another function of VGAM1489 is therefore inhibition of LOC143916 (Accession XM_084664). Accordingly, utilities of VGAM1489 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC143916. LOC146506 (Accession XM_085489) is another VGAM1489 host target gene. LOC146506 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC146506, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146506 BINDING SITE, designated SEQ ID:38180, to the nucleotide sequence of VGAM1489 RNA, herein designated VGAM RNA, also designated SEQ ID:4200.

[51528] Another function of VGAM1489 is therefore inhibition of LOC146506 (Accession XM_085489). Accordingly, utilities of VGAM1489 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146506. LOC152316 (Accession XM_098185) is another VGAM1489 host target gene. LOC152316 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC152316, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152316 BINDING SITE, designated SEQ ID:41453, to

the nucleotide sequence of VGAM1489 RNA, herein designated VGAM RNA, also designated SEQ ID:4200.

[51529] Another function of VGAM1489 is therefore inhibition of LOC152316 (Accession XM_098185). Accordingly, utilities of VGAM1489 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152316. LOC169026 (Accession XM_095471) is another VGAM1489 host target gene. LOC169026 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC169026, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC169026 BINDING SITE, designated SEQ ID:40266, to the nucleotide sequence of VGAM1489 RNA, herein designated VGAM RNA, also designated SEQ ID:4200.

[51530] Another function of VGAM1489 is therefore inhibition of LOC169026 (Accession XM_095471). Accordingly, utilities of VGAM1489 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC169026. LOC221876 (Accession XM_168220) is another VGAM1489 host target gene. LOC221876 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC221876, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221876 BINDING SITE, designated SEQ ID:45078, to the nucleotide sequence of VGAM1489 RNA, herein designated VGAM RNA, also designated SEQ ID:4200.

[51531] Another function of VGAM1489 is therefore inhibition of LOC221876 (Accession XM_168220). Accordingly, utilities of VGAM1489 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221876. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1490 (VGAM1490) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51532] VGAM1490 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1490 was detected is described hereinabove with reference to Figs. 1-8.

[51533] VGAM1490 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Plum Pox Virus.

VGAM1490 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51534] VGAM1490 gene encodes a VGAM1490 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1490 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1490 precursor RNA is designated SEQ ID:1476, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1476 is located at position 5866 relative to the genome of Plum Pox Virus.

[51535] VGAM1490 precursor RNA folds onto itself, forming VGAM1490 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51536] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1490 folded precursor RNA into VGAM1490 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1490 RNA is designated SEQ ID:4201, and is provided hereinbelow with reference to the sequence listing part.

[51537] VGAM1490 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1490 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1490 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[51538] VGAM1490 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1490 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1490 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1490 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1490 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[51539] The complementary binding of VGAM1490 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1490 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1490

host target RNA into VGAM1490 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51540] It is appreciated that VGAM1490 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1490 host target genes. The mRNA of each one of this plurality of VGAM1490 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1490 RNA, herein designated VGAM RNA, and which when bound by VGAM1490 RNA causes inhibition of translation of respective one or more VGAM1490 host target proteins.

[51541] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1490 gene, herein designated VGAM GENE, on one or more VGAM1490 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[51542] It is yet further appreciated that a function of VGAM1490 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1490 include diagnosis, prevention and treatment of viral infection by Plum Pox Virus. Specific functions, and accordingly utilities, of VGAM1490 correlate with, and may be deduced from, the identity of the host target genes which VGAM1490 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51543] Nucleotide sequences of the VGAM1490 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1490 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1490 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1490 are further

described hereinbelow with reference to Table 1.

[51544] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1490 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1490 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51545] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1490 gene, herein designated VGAM is inhibition of expression of VGAM1490 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1490 correlate with, and may be deduced from, the identity of the target genes which VGAM1490 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[51546] FLJ13187 (Accession NM_024613) is a VGAM1490 host target gene. FLJ13187 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13187, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13187 BINDING SITE,

designated SEQ ID:23869, to the nucleotide sequence of VGAM1490 RNA, herein designated VGAM RNA, also designated SEQ ID:4201.

[51547] A function of VGAM1490 is therefore inhibition of FLJ13187 (Accession NM_024613). Accordingly, utilities of VGAM1490 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13187. PLU-1 (Accession NM_006618) is another VGAM1490 host target gene. PLU-1 BINDING SITE1 and PLU-1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PLU-1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLU-1 BINDING SITE1 and PLU-1 BINDING SITE2, designated SEQ ID:13400 and SEQ ID:42249 respectively, to the nucleotide sequence of VGAM1490 RNA, herein designated VGAM RNA, also designated SEQ ID:4201.

[51548] Another function of VGAM1490 is therefore inhibition of PLU-1 (Accession NM_006618). Accordingly, utilities of VGAM1490 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLU-1.

Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1491 (VGAM1491) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51549] VGAM1491 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1491 was detected is described hereinabove with reference to Figs. 1–8.

[51550] VGAM1491 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Plum Pox Virus. VGAM1491 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51551] VGAM1491 gene encodes a VGAM1491 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1491 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1491 precursor RNA is designated SEQ ID:1477, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:1477 is located at position 5456 relative to the genome of Plum Pox Virus.

[51552] VGAM1491 precursor RNA folds onto itself, forming VGAM1491 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51553] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1491 folded precursor RNA into VGAM1491 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1491 RNA is designated SEQ ID:4202, and is provided hereinbelow with reference to the sequence listing part.

[51554] VGAM1491 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1491 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1491 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[51555] VGAM1491 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1491 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1491 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1491 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1491 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[51556] The complementary binding of VGAM1491 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1491 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1491 host target RNA into VGAM1491 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51557] It is appreciated that VGAM1491 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1491 host target genes. The mRNA of each one of this plurality of VGAM1491 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1491 RNA, herein designated VGAM RNA, and which when bound by VGAM1491 RNA causes inhibition of translation of respective one or more

VGAM1491 host target proteins.

[51558] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1491 gene, herein designated VGAM GENE, on one or more VGAM1491 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[51559] It is yet further appreciated that a function of VGAM1491 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1491 include diagnosis, prevention and treatment of viral infection by Plum Pox Virus. Specific

functions, and accordingly utilities, of VGAM1491 correlate with, and may be deduced from, the identity of the host target genes which VGAM1491 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51560] Nucleotide sequences of the VGAM1491 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1491 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1491 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1491 are further described hereinbelow with reference to Table 1.

[51561] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1491 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1491 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51562] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1491 gene, herein designated VGAM is inhibition of expression of VGAM1491 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM1491 correlate with, and may be deduced from, the identity of the target genes which VGAM1491 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[51563] Immunoglobulin Superfamily Containing Leucine-rich Repeat (ISLR, Accession NM_005545) is a VGAM1491 host target gene. ISLR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ISLR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ISLR BINDING SITE, designated SEQ ID:12072, to the nucleotide sequence of VGAM1491 RNA, herein designated VGAM RNA, also designated SEQ ID:4202.

[51564] A function of VGAM1491 is therefore inhibition of Immunoglobulin Superfamily Containing Leucine-rich Repeat (ISLR, Accession NM_005545). Accordingly, utilities of VGAM1491 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ISLR. SON DNA Binding Protein (SON, Accession NM_058183) is another VGAM1491 host target gene. SON BINDING SITE1 through SON BINDING SITE3 are HOST TARGET binding

sites found in untranslated regions of mRNA encoded by SON, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SON BINDING SITE1 through SON BINDING SITE3, designated SEQ ID:27743, SEQ ID:29039 and SEQ ID:29044 respectively, to the nucleotide sequence of VGAM1491 RNA, herein designated VGAM RNA, also designated SEQ ID:4202.

[51565] Another function of VGAM1491 is therefore inhibition of SON DNA Binding Protein (SON, Accession NM_058183). Accordingly, utilities of VGAM1491 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SON. DKFZP572C163 (Accession XM_028314) is another VGAM1491 host target gene. DKFZP572C163 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZP572C163, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP572C163 BINDING SITE, designated SEQ ID:30655, to the nucleotide sequence of VGAM1491 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4202.

[51566] Another function of VGAM1491 is therefore inhibition of DKFZP572C163 (Accession XM_028314). Accordingly, utilities of VGAM1491 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP572C163. KIAA0416 (Accession NM_015564) is another VGAM1491 host target gene. KIAA0416 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0416, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0416 BINDING SITE, designated SEQ ID:17829, to the nucleotide sequence of VGAM1491 RNA, herein designated VGAM RNA, also designated SEQ ID:4202.

[51567] Another function of VGAM1491 is therefore inhibition of KIAA0416 (Accession NM_015564). Accordingly, utilities of VGAM1491 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0416. MASA (Accession XM_035994) is another VGAM1491 host target gene. MASA BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MASA, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MASA BINDING SITE, designated SEQ ID:32372, to the nucleotide sequence of VGAM1491 RNA, herein designated VGAM RNA, also designated SEQ ID:4202.

[51568] Another function of VGAM1491 is therefore inhibition of MASA (Accession XM_035994). Accordingly, utilities of VGAM1491 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MASA. LOC152065 (Accession XM_098159) is another VGAM1491 host target gene. LOC152065 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152065, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152065 BINDING SITE, designated SEQ ID:41430, to the nucleotide sequence of VGAM1491 RNA, herein designated VGAM RNA, also designated SEQ ID:4202.

[51569] Another function of VGAM1491 is therefore inhibition of LOC152065 (Accession XM_098159). Accordingly, utilities of VGAM1491 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC152065. LOC220766 (Accession XM_165471) is another VGAM1491 host target gene. LOC220766 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220766, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220766 BINDING SITE, designated SEQ ID:43652, to the nucleotide sequence of VGAM1491 RNA, herein designated VGAM RNA, also designated SEQ ID:4202.

[51570] Another function of VGAM1491 is therefore inhibition of LOC220766 (Accession XM_165471). Accordingly, utilities of VGAM1491 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220766. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1492 (VGAM1492) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51571] VGAM1492 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1492 was detected is described hereinabove with reference to Figs. 1–8.

[51572] VGAM1492 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Johnsongrass Mosaic Virus. VGAM1492 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51573] VGAM1492 gene encodes a VGAM1492 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1492 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1492 precursor RNA is designated SEQ ID:1478, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1478 is located at position 2047 relative to the genome of Johnsongrass Mosaic Virus.

[51574] VGAM1492 precursor RNA folds onto itself, forming VGAM1492 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51575] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1492 folded precursor RNA into VGAM1492 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 73%) nucleotide sequence of VGAM1492 RNA is designated SEQ ID:4203, and is provided hereinbelow with reference to the sequence listing part.

[51576] VGAM1492 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1492 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1492 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[51577] VGAM1492 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1492 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1492 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1492 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1492 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[51578] The complementary binding of VGAM1492 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1492 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1492 host target RNA into VGAM1492 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51579] It is appreciated that VGAM1492 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1492 host target genes. The mRNA of each one of this plurality of VGAM1492 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1492 RNA, herein designated VGAM RNA, and which when bound by VGAM1492 RNA causes inhibition of translation of respective one or more VGAM1492 host target proteins.

[51580] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1492 gene, herein designated VGAM GENE, on one or more VGAM1492 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[51581] It is yet further appreciated that a function of VGAM1492 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1492 include diagnosis, prevention and treatment of viral infection by Johnsongrass Mosaic Virus. Specific functions, and accordingly utilities, of VGAM1492 correlate with, and may be deduced from, the identity of the host target genes which VGAM1492 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51582] Nucleotide sequences of the VGAM1492 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM1492 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1492 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1492 are further described hereinbelow with reference to Table 1.

[51583] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1492 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1492 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51584] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1492 gene, herein designated VGAM is inhibition of expression of VGAM1492 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1492 correlate with, and may be deduced from, the identity of the target genes which VGAM1492 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[51585] CDC23 (cell division cycle 23, yeast, homolog) (CDC23, Accession NM_004661) is a VGAM1492 host target gene. CDC23 BINDING SITE is HOST TARGET binding site found

in the 3' untranslated region of mRNA encoded by CDC23, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDC23 BINDING SITE, designated SEQ ID:11031, to the nucleotide sequence of VGAM1492 RNA, herein designated VGAM RNA, also designated SEQ ID:4203.

[51586] A function of VGAM1492 is therefore inhibition of CDC23 (cell division cycle 23, yeast, homolog) (CDC23, Accession NM_004661), a gene which is the cell cycle-regulated component of the mitotic cyclin degradation system. Accordingly, utilities of VGAM1492 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDC23. The function of CDC23 has been established by previous studies. is the cell cycle-regulated component of the mitotic cyclin degradation system.

[51587] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[51588] Yu, H.; Peters, J.-M.; King, R. W.; Page, A. M.; Hieter, P.; Kirschner, M. W. : Identification of a cullin homology region in a subunit of the anaphase-promoting complex.

Science 279: 1219–1222, 1998. ; and

[51589] Zhao, N.; Lai, F.; Fernald, A. A.; Eisenbart, J. D.; Espinosa, R., III.; Wang, P. W.; Le Beau, M. M. : Human CDC23: cDNA cloning, mapping to 5q31, genomic structure, and evaluation as a.

[51590] Further studies establishing the function and utilities of CDC23 are found in John Hopkins OMIM database record ID 603462, and in cited publications numbered 2878–2879 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Egl Nine Homolog 3 (C. elegans) (EGLN3, Accession NM_022073) is another VGAM1492 host target gene. EGLN3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EGLN3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGLN3 BINDING SITE, designated SEQ ID:22617, to the nucleotide sequence of VGAM1492 RNA, herein designated VGAM RNA, also designated SEQ ID:4203.

[51591] Another function of VGAM1492 is therefore inhibition of Egl Nine Homolog 3 (C. elegans) (EGLN3, Accession NM_022073), a gene which is an essential component of

the pathway. Accordingly, utilities of VGAM1492 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGLN3. The function of EGLN3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM206.Peroxisomal Farnesylated Protein (PXF, Accession NM_002857) is another VGAM1492 host target gene. PXF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PXF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PXF BINDING SITE, designated SEQ ID:8749, to the nucleotide sequence of VGAM1492 RNA, herein designated VGAM RNA, also designated SEQ ID:4203.

[51592] Another function of VGAM1492 is therefore inhibition of Peroxisomal Farnesylated Protein (PXF, Accession NM_002857), a gene which may function in peroxisomal biogenesis or assembly. Accordingly, utilities of VGAM1492 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PXF. The function of PXF and its association with various dis-

eases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM193. Sodium Channel, Voltage-gated, Type I, Alpha Polypeptide (SCN1A, Accession XM_114281) is another VGAM1492 host target gene. SCN1A BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SCN1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCN1A BINDING SITE, designated SEQ ID:42829, to the nucleotide sequence of VGAM1492 RNA, herein designated VGAM RNA, also designated SEQ ID:4203.

[51593] Another function of VGAM1492 is therefore inhibition of Sodium Channel, Voltage-gated, Type I, Alpha Polypeptide (SCN1A, Accession XM_114281). Accordingly, utilities of VGAM1492 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCN1A. KIAA1260 (Accession XM_010461) is another VGAM1492 host target gene. KIAA1260 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1260, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1260 BINDING SITE, designated SEQ ID:30156, to the nucleotide sequence of VGAM1492 RNA, herein designated VGAM RNA, also designated SEQ ID:4203.

[51594] Another function of VGAM1492 is therefore inhibition of KIAA1260 (Accession XM_010461). Accordingly, utilities of VGAM1492 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1260. LIM and SH3 Protein 1 (LASP1, Accession NM_006148) is another VGAM1492 host target gene. LASP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LASP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LASP1 BINDING SITE, designated SEQ ID:12799, to the nucleotide sequence of VGAM1492 RNA, herein designated VGAM RNA, also designated SEQ ID:4203.

[51595] Another function of VGAM1492 is therefore inhibition of LIM and SH3 Protein 1 (LASP1, Accession NM_006148). Accordingly, utilities of VGAM1492 include diagnosis,

prevention and treatment of diseases and clinical conditions associated with LASP1. Nuclear Receptor Coactivator 2 (NCOA2, Accession NM_006540) is another VGAM1492 host target gene. NCOA2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NCOA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NCOA2 BINDING SITE, designated SEQ ID:13293, to the nucleotide sequence of VGAM1492 RNA, herein designated VGAM RNA, also designated SEQ ID:4203.

[51596] Another function of VGAM1492 is therefore inhibition of Nuclear Receptor Coactivator 2 (NCOA2, Accession NM_006540). Accordingly, utilities of VGAM1492 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCOA2. SNRK (Accession NM_017719) is another VGAM1492 host target gene. SNRK BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SNRK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of SNRK BINDING SITE, designated SEQ ID:19306, to the nucleotide sequence of VGAM1492 RNA, herein designated VGAM RNA, also designated SEQ ID:4203.

[51597] Another function of VGAM1492 is therefore inhibition of SNRK (Accession NM_017719). Accordingly, utilities of VGAM1492 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNRK. LOC145662 (Accession XM_085194) is another VGAM1492 host target gene. LOC145662 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145662, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145662 BINDING SITE, designated SEQ ID:37917, to the nucleotide sequence of VGAM1492 RNA, herein designated VGAM RNA, also designated SEQ ID:4203.

[51598] Another function of VGAM1492 is therefore inhibition of LOC145662 (Accession XM_085194). Accordingly, utilities of VGAM1492 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145662. LOC203350 (Accession XM_117536) is another VGAM1492 host target gene. LOC203350 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203350, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203350 BINDING SITE, designated SEQ ID:43530, to the nucleotide sequence of VGAM1492 RNA, herein designated VGAM RNA, also designated SEQ ID:4203.

[51599] Another function of VGAM1492 is therefore inhibition of LOC203350 (Accession XM_117536). Accordingly, utilities of VGAM1492 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203350. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1493 (VGAM1493) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51600] VGAM1493 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1493 was detected is described hereinabove with reference to Figs. 1-8.

[51601] VGAM1493 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Johnsongrass Mosaic Virus. VGAM1493 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51602] VGAM1493 gene encodes a VGAM1493 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1493 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1493 precursor RNA is designated SEQ ID:1479, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1479 is located at position 7469 relative to the genome of Johnsongrass Mosaic Virus.

[51603] VGAM1493 precursor RNA folds onto itself, forming VGAM1493 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[51604] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1493 folded precursor RNA into VGAM1493 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1493 RNA is designated SEQ ID:4204, and is provided hereinbelow with reference to the sequence listing part.

[51605] VGAM1493 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1493 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1493 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[51606] VGAM1493 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1493 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1493 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1493 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1493 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[51607] The complementary binding of VGAM1493 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1493 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1493 host target RNA into VGAM1493 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51608] It is appreciated that VGAM1493 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1493 host target genes. The mRNA of each one of this plurality of VGAM1493 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1493 RNA, herein designated VGAM RNA, and which when bound by VGAM1493 RNA causes inhibition of translation of respective one or more VGAM1493 host target proteins.

[51609] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1493 gene, herein designated VGAM GENE, on one or more VGAM1493 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[51610] It is yet further appreciated that a function of VGAM1493 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1493 include diagnosis, prevention and treatment of viral infection by Johnsongrass Mosaic Virus. Specific functions, and accordingly utilities, of VGAM1493 correlate with, and may be deduced from, the identity of the host target genes which VGAM1493 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51611] Nucleotide sequences of the VGAM1493 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1493 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1493 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1493 are further described hereinbelow with reference to Table 1.

[51612] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1493 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1493 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51613] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1493 gene, herein designated VGAM is inhibition of expression of VGAM1493 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1493 correlate with, and may be deduced from, the identity of the target genes which VGAM1493 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[51614] LIM Domain Kinase 1 (LIMK1, Accession NM_002314) is a VGAM1493 host target gene. LIMK1 BINDING SITE1 and LIMK1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LIMK1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Ta-

ble 2 illustrates the complementarity of the nucleotide sequences of LIMK1 BINDING SITE1 and LIMK1 BINDING SITE2, designated SEQ ID:8123 and SEQ ID:18794 respectively, to the nucleotide sequence of VGAM1493 RNA, herein designated VGAM RNA, also designated SEQ ID:4204.

[51615] A function of VGAM1493 is therefore inhibition of LIM Domain Kinase 1 (LIMK1, Accession NM_002314). Accordingly, utilities of VGAM1493 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIMK1. Nidogen (enactin) (NID, Accession NM_002508) is another VGAM1493 host target gene. NID BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NID, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NID BINDING SITE, designated SEQ ID:8339, to the nucleotide sequence of VGAM1493 RNA, herein designated VGAM RNA, also designated SEQ ID:4204.

[51616] Another function of VGAM1493 is therefore inhibition of Nidogen (enactin) (NID, Accession NM_002508). Accordingly, utilities of VGAM1493 include diagnosis, prevention

and treatment of diseases and clinical conditions associated with NID. PDGFA Associated Protein 1 (PDAP1, Accession XM_166484) is another VGAM1493 host target gene. PDAP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PDAP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDAP1 BINDING SITE, designated SEQ ID:44421, to the nucleotide sequence of VGAM1493 RNA, herein designated VGAM RNA, also designated SEQ ID:4204.

[51617] Another function of VGAM1493 is therefore inhibition of PDGFA Associated Protein 1 (PDAP1, Accession XM_166484). Accordingly, utilities of VGAM1493 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDAP1. Ribosomal Protein L17 (RPL17, Accession NM_000985) is another VGAM1493 host target gene. RPL17 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by RPL17, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of RPL17 BINDING SITE, designated SEQ ID:6695, to the nucleotide sequence of VGAM1493 RNA, herein designated VGAM RNA, also designated SEQ ID:4204.

[51618] Another function of VGAM1493 is therefore inhibition of Ribosomal Protein L17 (RPL17, Accession NM_000985). Accordingly, utilities of VGAM1493 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPL17. TEM8 (Accession NM_032208) is another VGAM1493 host target gene. TEM8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TEM8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TEM8 BINDING SITE, designated SEQ ID:25916, to the nucleotide sequence of VGAM1493 RNA, herein designated VGAM RNA, also designated SEQ ID:4204.

[51619] Another function of VGAM1493 is therefore inhibition of TEM8 (Accession NM_032208), a gene which is a tumor-specific endothelial marker. Accordingly, utilities of VGAM1493 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TEM8.

The function of TEM8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1489. Zinc Finger Protein 264 (ZNF264, Accession NM_003417) is another VGAM1493 host target gene. ZNF264 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF264, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF264 BINDING SITE, designated SEQ ID:9454, to the nucleotide sequence of VGAM1493 RNA, herein designated VGAM RNA, also designated SEQ ID:4204.

[51620] Another function of VGAM1493 is therefore inhibition of Zinc Finger Protein 264 (ZNF264, Accession NM_003417). Accordingly, utilities of VGAM1493 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF264. Rho Guanine Exchange Factor (GEF) 16 (ARHGEF16, Accession NM_014448) is another VGAM1493 host target gene. ARHGEF16 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ARHGEF16, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHGEF16 BINDING SITE, designated SEQ ID:15799, to the nucleotide sequence of VGAM1493 RNA, herein designated VGAM RNA, also designated SEQ ID:4204.

[51621] Another function of VGAM1493 is therefore inhibition of Rho Guanine Exchange Factor (GEF) 16 (ARHGEF16, Accession NM_014448). Accordingly, utilities of VGAM1493 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGEF16. DKFZp761J139 (Accession NM_032280) is another VGAM1493 host target gene. DKFZp761J139 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZp761J139, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761J139 BINDING SITE, designated SEQ ID:26033, to the nucleotide sequence of VGAM1493 RNA, herein designated VGAM RNA, also designated SEQ ID:4204.

[51622] Another function of VGAM1493 is therefore inhibition of DKFZp761J139 (Accession NM_032280). Accordingly, util-

ities of VGAM1493 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761J139. DKFZp761N0624 (Accession NM_032295) is another VGAM1493 host target gene. DKFZp761N0624 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp761N0624, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761N0624 BINDING SITE, designated SEQ ID:26073, to the nucleotide sequence of VGAM1493 RNA, herein designated VGAM RNA, also designated SEQ ID:4204.

[51623] Another function of VGAM1493 is therefore inhibition of DKFZp761N0624 (Accession NM_032295). Accordingly, utilities of VGAM1493 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761N0624. DKFZp762E1511 (Accession XM_003460) is another VGAM1493 host target gene. DKFZp762E1511 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp762E1511, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BIND-

ING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp762E1511 BINDING SITE, designated SEQ ID:29932, to the nucleotide sequence of VGAM1493 RNA, herein designated VGAM RNA, also designated SEQ ID:4204.

[51624] Another function of VGAM1493 is therefore inhibition of DKFZp762E1511 (Accession XM_003460). Accordingly, utilities of VGAM1493 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp762E1511. FLJ14917 (Accession NM_032861) is another VGAM1493 host target gene. FLJ14917 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14917, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14917 BINDING SITE, designated SEQ ID:26666, to the nucleotide sequence of VGAM1493 RNA, herein designated VGAM RNA, also designated SEQ ID:4204.

[51625] Another function of VGAM1493 is therefore inhibition of FLJ14917 (Accession NM_032861). Accordingly, utilities of VGAM1493 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ14917. KIAA1237 (Accession XM_087386) is another VGAM1493 host target gene. KIAA1237 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1237, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1237 BINDING SITE, designated SEQ ID:39219, to the nucleotide sequence of VGAM1493 RNA, herein designated VGAM RNA, also designated SEQ ID:4204.

[51626] Another function of VGAM1493 is therefore inhibition of KIAA1237 (Accession XM_087386). Accordingly, utilities of VGAM1493 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1237. Neuropilin (NRP) and Tolloid (TLL)-like 2 (NETO2, Accession NM_018092) is another VGAM1493 host target gene. NETO2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NETO2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NETO2 BINDING SITE, designated SEQ ID:19861, to the nucleotide sequence of

VGAM1493 RNA, herein designated VGAM RNA, also designated SEQ ID:4204.

[51627] Another function of VGAM1493 is therefore inhibition of Neuropilin (NRP) and Tolloid (TLL)-like 2 (NETO2, Accession NM_018092). Accordingly, utilities of VGAM1493 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NETO2. Transient Receptor Potential Cation Channel, Subfamily M, Member 3 (TRPM3, Accession XM_036123) is another VGAM1493 host target gene. TRPM3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRPM3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPM3 BINDING SITE, designated SEQ ID:32391, to the nucleotide sequence of VGAM1493 RNA, herein designated VGAM RNA, also designated SEQ ID:4204.

[51628] Another function of VGAM1493 is therefore inhibition of Transient Receptor Potential Cation Channel, Subfamily M, Member 3 (TRPM3, Accession XM_036123). Accordingly, utilities of VGAM1493 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with TRPM3. LOC142820 (Accession XM_084353) is another VGAM1493 host target gene. LOC142820 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC142820, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC142820 BINDING SITE, designated SEQ ID:37561, to the nucleotide sequence of VGAM1493 RNA, herein designated VGAM RNA, also designated SEQ ID:4204.

[51629] Another function of VGAM1493 is therefore inhibition of LOC142820 (Accession XM_084353). Accordingly, utilities of VGAM1493 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC142820. LOC163682 (Accession XM_099402) is another VGAM1493 host target gene. LOC163682 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC163682, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC163682 BINDING SITE, designated SEQ ID:42088, to the nucleotide sequence of VGAM1493 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4204.

[51630] Another function of VGAM1493 is therefore inhibition of LOC163682 (Accession XM_099402). Accordingly, utilities of VGAM1493 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC163682. LOC51312 (Accession NM_018579) is another VGAM1493 host target gene. LOC51312 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51312, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51312 BINDING SITE, designated SEQ ID:20658, to the nucleotide sequence of VGAM1493 RNA, herein designated VGAM RNA, also designated SEQ ID:4204.

[51631] Another function of VGAM1493 is therefore inhibition of LOC51312 (Accession NM_018579). Accordingly, utilities of VGAM1493 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51312. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1494 (VGAM1494) viral gene, which

modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51632] VGAM1494 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1494 was detected is described hereinabove with reference to Figs. 1–8.

[51633] VGAM1494 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Johnsongrass Mosaic Virus. VGAM1494 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51634] VGAM1494 gene encodes a VGAM1494 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1494 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1494 precursor RNA is designated SEQ ID:1480, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1480 is located at position 656 relative to the genome of Johnsongrass Mosaic Virus.

[51635] VGAM1494 precursor RNA folds onto itself, forming

VGAM1494 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51636] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1494 folded precursor RNA into VGAM1494 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1494 RNA is designated SEQ ID:4205, and is provided hereinbelow with reference to the sequence listing part.

[51637] VGAM1494 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1494 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1494 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[51638] VGAM1494 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1494 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1494 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1494 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1494 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[51639] The complementary binding of VGAM1494 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1494 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1494 host target RNA into VGAM1494 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51640] It is appreciated that VGAM1494 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1494 host target genes. The mRNA of each one of this plurality of VGAM1494 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1494 RNA, herein designated VGAM RNA, and which when bound by VGAM1494 RNA causes inhibition of translation of respective one or more VGAM1494 host target proteins.

[51641] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1494 gene, herein designated VGAM GENE, on one or more VGAM1494 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[51642] It is yet further appreciated that a function of VGAM1494 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1494 include diagnosis, prevention and treatment of viral infection by Johnsongrass Mosaic Virus. Specific functions, and accordingly utilities, of VGAM1494 correlate with, and may be deduced from, the identity of the host target genes which VGAM1494 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[51643] Nucleotide sequences of the VGAM1494 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1494 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1494 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1494 are further described hereinbelow with reference to Table 1.

[51644] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1494 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1494 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51645] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1494 gene, herein designated VGAM is inhibition of expression of VGAM1494 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1494 correlate with, and may be deduced from, the identity of the target genes which VGAM1494 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[51646] Calcium Channel, Voltage-dependent, Alpha 2/delta 3 Subunit (CACNA2D3, Accession NM_018398) is a VGAM1494 host target gene. CACNA2D3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CACNA2D3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CACNA2D3 BINDING SITE, designated SEQ ID:20434, to the nucleotide sequence of VGAM1494 RNA, herein designated VGAM RNA, also designated SEQ ID:4205.

[51647] A function of VGAM1494 is therefore inhibition of Calcium Channel, Voltage-dependent, Alpha 2/delta 3 Subunit (CACNA2D3, Accession NM_018398). Accordingly, utilities of VGAM1494 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CACNA2D3. Folate Receptor 1 (adult) (FOLR1, Accession NM_016730) is another VGAM1494 host target gene. FOLR1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FOLR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of FOLR1 BINDING SITE, designated SEQ ID:18781, to the nucleotide sequence of VGAM1494 RNA, herein designated VGAM RNA, also designated SEQ ID:4205.

[51648] Another function of VGAM1494 is therefore inhibition of Folate Receptor 1 (adult) (FOLR1, Accession NM_016730), a gene which binds and initiates transport of folate and methotrexate. Accordingly, utilities of VGAM1494 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FOLR1. The function of FOLR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM399.Sp3 Transcription Factor (SP3, Accession XM_092672) is another VGAM1494 host target gene. SP3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SP3 BINDING SITE, designated SEQ ID:40135, to the nucleotide sequence of VGAM1494 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4205.

[51649] Another function of VGAM1494 is therefore inhibition of Sp3 Transcription Factor (SP3, Accession XM_092672), a gene which binds to gt and gc boxes promoters elements. Accordingly, utilities of VGAM1494 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SP3. The function of SP3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM861. COP9 (Accession NM_006710) is another VGAM1494 host target gene. COP9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by COP9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COP9 BINDING SITE, designated SEQ ID:13533, to the nucleotide sequence of VGAM1494 RNA, herein designated VGAM RNA, also designated SEQ ID:4205.

[51650] Another function of VGAM1494 is therefore inhibition of COP9 (Accession NM_006710). Accordingly, utilities of VGAM1494 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COP9.

KIAA0303 (Accession XM_045292) is another VGAM1494 host target gene. KIAA0303 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0303, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0303 BINDING SITE, designated SEQ ID:34423, to the nucleotide sequence of VGAM1494 RNA, herein designated VGAM RNA, also designated SEQ ID:4205.

[51651] Another function of VGAM1494 is therefore inhibition of KIAA0303 (Accession XM_045292). Accordingly, utilities of VGAM1494 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0303. KIAA1007 (Accession XM_168026) is another VGAM1494 host target gene. KIAA1007 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1007, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1007 BINDING SITE, designated SEQ ID:44947, to the nucleotide sequence of VGAM1494 RNA, herein design-

nated VGAM RNA, also designated SEQ ID:4205.

[51652] Another function of VGAM1494 is therefore inhibition of KIAA1007 (Accession XM_168026). Accordingly, utilities of VGAM1494 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1007. KIAA1336 (Accession XM_051306) is another VGAM1494 host target gene. KIAA1336 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1336, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1336 BINDING SITE, designated SEQ ID:35798, to the nucleotide sequence of VGAM1494 RNA, herein designated VGAM RNA, also designated SEQ ID:4205.

[51653] Another function of VGAM1494 is therefore inhibition of KIAA1336 (Accession XM_051306). Accordingly, utilities of VGAM1494 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1336. NY-REN-60 (Accession XM_040506) is another VGAM1494 host target gene. NY-REN-60 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NY-REN-60, corresponding

to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NY-REN-60 BINDING SITE, designated SEQ ID:33318, to the nucleotide sequence of VGAM1494 RNA, herein designated VGAM RNA, also designated SEQ ID:4205.

[51654] Another function of VGAM1494 is therefore inhibition of NY-REN-60 (Accession XM_040506). Accordingly, utilities of VGAM1494 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NY-REN-60. LOC152190 (Accession XM_045692) is another VGAM1494 host target gene. LOC152190 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152190, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152190 BINDING SITE, designated SEQ ID:34523, to the nucleotide sequence of VGAM1494 RNA, herein designated VGAM RNA, also designated SEQ ID:4205.

[51655] Another function of VGAM1494 is therefore inhibition of LOC152190 (Accession XM_045692). Accordingly, utilities of VGAM1494 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC152190. LOC257471 (Accession XM_171020) is another VGAM1494 host target gene. LOC257471 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257471, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257471 BINDING SITE, designated SEQ ID:45787, to the nucleotide sequence of VGAM1494 RNA, herein designated VGAM RNA, also designated SEQ ID:4205.

[51656] Another function of VGAM1494 is therefore inhibition of LOC257471 (Accession XM_171020). Accordingly, utilities of VGAM1494 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257471. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1495 (VGAM1495) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51657] VGAM1495 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1495 was detected is described hereinabove with reference to Figs. 1–8.

[51658] VGAM1495 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Johnsongrass Mosaic Virus. VGAM1495 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51659] VGAM1495 gene encodes a VGAM1495 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1495 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1495 precursor RNA is designated SEQ ID:1481, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1481 is located at position 5140 relative to the genome of Johnsongrass Mosaic Virus.

[51660] VGAM1495 precursor RNA folds onto itself, forming VGAM1495 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51661] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1495 folded precursor RNA into VGAM1495 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 66%) nucleotide sequence of VGAM1495 RNA is designated SEQ ID:4206, and is provided hereinbelow with reference to the sequence listing part.

[51662] VGAM1495 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1495 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1495 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[51663] VGAM1495 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1495 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1495 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1495 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1495 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[51664] The complementary binding of VGAM1495 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1495 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1495 host target RNA into VGAM1495 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51665] It is appreciated that VGAM1495 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1495 host target genes. The mRNA of each one of this plurality of VGAM1495 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1495 RNA, herein designated VGAM RNA, and which when bound by VGAM1495 RNA causes inhibition of translation of respective one or more VGAM1495 host target proteins.

[51666] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1495 gene, herein designated VGAM GENE, on one or more VGAM1495 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[51667] It is yet further appreciated that a function of VGAM1495 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1495 include diagnosis, prevention and treatment of viral infection by Johnsongrass Mosaic Virus. Specific functions, and accordingly utilities, of VGAM1495 correlate with, and may be deduced from, the identity of the host target genes which VGAM1495 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51668] Nucleotide sequences of the VGAM1495 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM1495 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1495 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1495 are further described hereinbelow with reference to Table 1.

[51669] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1495 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1495 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51670] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1495 gene, herein designated VGAM is inhibition of expression of VGAM1495 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1495 correlate with, and may be deduced from, the identity of the target genes which VGAM1495 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[51671] G Protein-coupled Receptor Kinase 7 (GPRK7, Accession NM_139209) is a VGAM1495 host target gene. GPRK7 BINDING SITE is HOST TARGET binding site found in the

3` untranslated region of mRNA encoded by GPRK7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPRK7 BINDING SITE, designated SEQ ID:29229, to the nucleotide sequence of VGAM1495 RNA, herein designated VGAM RNA, also designated SEQ ID:4206.

[51672] A function of VGAM1495 is therefore inhibition of G Protein-coupled Receptor Kinase 7 (GPRK7, Accession NM_139209), a gene which may play a role in signal transduction pathways that involve calcium as a second messenger. Accordingly, utilities of VGAM1495 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPRK7. The function of GPRK7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM640.CAGE (Accession XM_095071) is another VGAM1495 host target gene. CAGE BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CAGE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of CAGE BINDING SITE, designated SEQ ID:40245, to the nucleotide sequence of VGAM1495 RNA, herein designated VGAM RNA, also designated SEQ ID:4206.

[51673] Another function of VGAM1495 is therefore inhibition of CAGE (Accession XM_095071). Accordingly, utilities of VGAM1495 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAGE. FLJ20079 (Accession NM_017656) is another VGAM1495 host target gene. FLJ20079 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20079, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20079 BINDING SITE, designated SEQ ID:19169, to the nucleotide sequence of VGAM1495 RNA, herein designated VGAM RNA, also designated SEQ ID:4206.

[51674] Another function of VGAM1495 is therefore inhibition of FLJ20079 (Accession NM_017656). Accordingly, utilities of VGAM1495 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20079. HSA250839 (Accession NM_018401) is another

VGAM1495 host target gene. HSA250839 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSA250839, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSA250839 BINDING SITE, designated SEQ ID:20437, to the nucleotide sequence of VGAM1495 RNA, herein designated VGAM RNA, also designated SEQ ID:4206.

[51675] Another function of VGAM1495 is therefore inhibition of HSA250839 (Accession NM_018401). Accordingly, utilities of VGAM1495 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSA250839. KIAA0376 (Accession XM_037759) is another VGAM1495 host target gene. KIAA0376 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0376, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0376 BINDING SITE, designated SEQ ID:32672, to the nucleotide sequence of VGAM1495 RNA, herein designated VGAM RNA, also designated SEQ ID:4206.

[51676] Another function of VGAM1495 is therefore inhibition of KIAA0376 (Accession XM_037759). Accordingly, utilities of VGAM1495 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0376. pcnp (Accession NM_020357) is another VGAM1495 host target gene. pcnp BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by pcnp, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of pcnp BINDING SITE, designated SEQ ID:21626, to the nucleotide sequence of VGAM1495 RNA, herein designated VGAM RNA, also designated SEQ ID:4206.

[51677] Another function of VGAM1495 is therefore inhibition of pcnp (Accession NM_020357). Accordingly, utilities of VGAM1495 include diagnosis, prevention and treatment of diseases and clinical conditions associated with pcnp. LOC145854 (Accession XM_085259) is another VGAM1495 host target gene. LOC145854 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC145854, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145854 BINDING SITE, designated SEQ ID:38006, to the nucleotide sequence of VGAM1495 RNA, herein designated VGAM RNA, also designated SEQ ID:4206.

[51678] Another function of VGAM1495 is therefore inhibition of LOC145854 (Accession XM_085259). Accordingly, utilities of VGAM1495 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145854. LOC152271 (Accession XM_087419) is another VGAM1495 host target gene. LOC152271 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152271, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152271 BINDING SITE, designated SEQ ID:39238, to the nucleotide sequence of VGAM1495 RNA, herein designated VGAM RNA, also designated SEQ ID:4206.

[51679] Another function of VGAM1495 is therefore inhibition of LOC152271 (Accession XM_087419). Accordingly, utilities of VGAM1495 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC152271. LOC152315 (Accession XM_087440) is another VGAM1495 host target gene. LOC152315 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152315, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152315 BINDING SITE, designated SEQ ID:39256, to the nucleotide sequence of VGAM1495 RNA, herein designated VGAM RNA, also designated SEQ ID:4206.

[51680] Another function of VGAM1495 is therefore inhibition of LOC152315 (Accession XM_087440). Accordingly, utilities of VGAM1495 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152315. LOC219919 (Accession XM_167785) is another VGAM1495 host target gene. LOC219919 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC219919, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219919 BINDING SITE, designated SEQ ID:44799, to the nucleotide sequence of VGAM1495 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4206.

[51681] Another function of VGAM1495 is therefore inhibition of LOC219919 (Accession XM_167785). Accordingly, utilities of VGAM1495 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219919. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1496 (VGAM1496) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51682] VGAM1496 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1496 was detected is described hereinabove with reference to Figs. 1–8.

[51683] VGAM1496 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine Herpesvirus 1. VGAM1496 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51684] VGAM1496 gene encodes a VGAM1496 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM1496 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1496 precursor RNA is designated SEQ ID:1482, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1482 is located at position 110360 relative to the genome of Alcelaphine Herpesvirus 1.

- [51685] VGAM1496 precursor RNA folds onto itself, forming VGAM1496 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [51686] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1496 folded precursor RNA into VGAM1496 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM1496 RNA is designated SEQ ID:4207, and is provided hereinbelow with reference to the sequence listing part.

[51687] VGAM1496 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1496 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1496 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[51688] VGAM1496 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1496 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1496 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1496 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1496 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[51689] The complementary binding of VGAM1496 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1496 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1496 host target RNA into VGAM1496 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51690] It is appreciated that VGAM1496 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1496 host target genes. The mRNA of

each one of this plurality of VGAM1496 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1496 RNA, herein designated VGAM RNA, and which when bound by VGAM1496 RNA causes inhibition of translation of respective one or more VGAM1496 host target proteins.

[51691] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1496 gene, herein designated VGAM GENE, on one or more VGAM1496 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[51692] It is yet further appreciated that a function of VGAM1496 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1496 include diagnosis, prevention and treatment of viral infection by Alcelaphine Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1496 correlate with, and may be deduced from, the identity of the host target genes which VGAM1496 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51693] Nucleotide sequences of the VGAM1496 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1496 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1496 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1496 are further described hereinbelow with reference to Table 1.

[51694] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1496 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1496 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51695] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1496 gene, herein designated VGAM is inhibition of expression of VGAM1496 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1496 correlate with, and may be deduced from, the identity of the target genes which VGAM1496 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[51696] Cyclin-dependent Kinase Inhibitor 2B (p15, inhibits CDK4) (CDKN2B, Accession NM_078487) is a VGAM1496 host target gene. CDKN2B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CDKN2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDKN2B BINDING SITE, designated SEQ ID:27807, to the nucleotide sequence of VGAM1496 RNA, herein designated VGAM RNA, also designated SEQ ID:4207.

[51697] A function of VGAM1496 is therefore inhibition of Cyclin-dependent Kinase Inhibitor 2B (p15, inhibits CDK4)

(CDKN2B, Accession NM_078487). Accordingly, utilities of VGAM1496 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDKN2B. ATIP1 (Accession NM_020749) is another VGAM1496 host target gene. ATIP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATIP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATIP1 BINDING SITE, designated SEQ ID:21860, to the nucleotide sequence of VGAM1496 RNA, herein designated VGAM RNA, also designated SEQ ID:4207.

[51698] Another function of VGAM1496 is therefore inhibition of ATIP1 (Accession NM_020749). Accordingly, utilities of VGAM1496 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATIP1. DKFZp761D221 (Accession NM_032291) is another VGAM1496 host target gene. DKFZp761D221 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp761D221, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of DKFZp761D221 BINDING SITE, designated SEQ ID:26054, to the nucleotide sequence of VGAM1496 RNA, herein designated VGAM RNA, also designated SEQ ID:4207.

[51699] Another function of VGAM1496 is therefore inhibition of DKFZp761D221 (Accession NM_032291). Accordingly, utilities of VGAM1496 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761D221. FLJ00026 (Accession XM_036307) is another VGAM1496 host target gene. FLJ00026 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ00026, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ00026 BINDING SITE, designated SEQ ID:32425, to the nucleotide sequence of VGAM1496 RNA, herein designated VGAM RNA, also designated SEQ ID:4207.

[51700] Another function of VGAM1496 is therefore inhibition of FLJ00026 (Accession XM_036307). Accordingly, utilities of VGAM1496 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ00026. HCA127 (Accession NM_018684) is another VGAM1496 host target gene. HCA127 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HCA127, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HCA127 BINDING SITE, designated SEQ ID:20755, to the nucleotide sequence of VGAM1496 RNA, herein designated VGAM RNA, also designated SEQ ID:4207.

[51701] Another function of VGAM1496 is therefore inhibition of HCA127 (Accession NM_018684). Accordingly, utilities of VGAM1496 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HCA127. Tumor Protein D52 (TPD52, Accession NM_005079) is another VGAM1496 host target gene. TPD52 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TPD52, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TPD52 BINDING SITE, designated SEQ ID:11529, to the nucleotide sequence of VGAM1496 RNA,

herein designated VGAM RNA, also designated SEQ ID:4207.

[51702] Another function of VGAM1496 is therefore inhibition of Tumor Protein D52 (TPD52, Accession NM_005079). Accordingly, utilities of VGAM1496 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TPD52. LOC115073 (Accession XM_055193) is another VGAM1496 host target gene. LOC115073 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC115073, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115073 BINDING SITE, designated SEQ ID:36235, to the nucleotide sequence of VGAM1496 RNA, herein designated VGAM RNA, also designated SEQ ID:4207.

[51703] Another function of VGAM1496 is therefore inhibition of LOC115073 (Accession XM_055193). Accordingly, utilities of VGAM1496 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115073. LOC221641 (Accession XM_168090) is another VGAM1496 host target gene. LOC221641 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221641, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221641 BINDING SITE, designated SEQ ID:45007, to the nucleotide sequence of VGAM1496 RNA, herein designated VGAM RNA, also designated SEQ ID:4207.

[51704] Another function of VGAM1496 is therefore inhibition of LOC221641 (Accession XM_168090). Accordingly, utilities of VGAM1496 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221641. LOC91250 (Accession XM_037135) is another VGAM1496 host target gene. LOC91250 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91250, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91250 BINDING SITE, designated SEQ ID:32545, to the nucleotide sequence of VGAM1496 RNA, herein designated VGAM RNA, also designated SEQ ID:4207.

[51705] Another function of VGAM1496 is therefore inhibition of

LOC91250 (Accession XM_037135). Accordingly, utilities of VGAM1496 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91250. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1497 (VGAM1497) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51706] VGAM1497 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1497 was detected is described hereinabove with reference to Figs. 1-8.

[51707] VGAM1497 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine Herpesvirus 1. VGAM1497 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51708] VGAM1497 gene encodes a VGAM1497 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1497 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1497 precursor RNA is designated SEQ ID:1483, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1483 is located at position 108884 relative to the genome of Alcelaphine Herpesvirus 1.

- [51709] VGAM1497 precursor RNA folds onto itself, forming VGAM1497 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [51710] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1497 folded precursor RNA into VGAM1497 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide se-

quence of VGAM1497 RNA is designated SEQ ID:4208, and is provided hereinbelow with reference to the sequence listing part.

[51711] VGAM1497 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1497 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1497 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[51712] VGAM1497 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1497 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1497 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM1497 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1497 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[51713] The complementary binding of VGAM1497 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1497 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1497 host target RNA into VGAM1497 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51714] It is appreciated that VGAM1497 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1497 host target genes. The mRNA of each one of this plurality of VGAM1497 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1497 RNA, herein designated VGAM RNA, and which when bound by VGAM1497 RNA causes inhibition of translation of respective one or more VGAM1497 host target proteins.

[51715] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1497 gene, herein designated VGAM GENE, on one or more VGAM1497 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[51716] It is yet further appreciated that a function of VGAM1497

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1497 include diagnosis, prevention and treatment of viral infection by Alcelaphine Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1497 correlate with, and may be deduced from, the identity of the host target genes which VGAM1497 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51717] Nucleotide sequences of the VGAM1497 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1497 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1497 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1497 are further described hereinbelow with reference to Table 1.

[51718] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1497 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1497 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51719] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1497 gene, herein designated VGAM is inhibition of expression of VGAM1497 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1497 correlate with, and may be deduced from, the identity of the target genes which VGAM1497 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[51720] B-cell CLL/lymphoma 7B (BCL7B, Accession NM_001707) is a VGAM1497 host target gene. BCL7B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BCL7B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL7B BINDING SITE, designated SEQ ID:7434, to the nucleotide sequence of VGAM1497 RNA, herein designated VGAM RNA, also designated SEQ ID:4208.

[51721] A function of VGAM1497 is therefore inhibition of B-cell CLL/lymphoma 7B (BCL7B, Accession NM_001707), a gene which is of yet unknown function. Accordingly, utilities of VGAM1497 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL7B.

The function of BCL7B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1189. Transcription Factor 12 (HTF4, helix-loop-helix transcription factors 4) (TCF12, Accession NM_003205) is another VGAM1497 host target gene. TCF12 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TCF12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCF12 BINDING SITE, designated SEQ ID:9200, to the nucleotide sequence of VGAM1497 RNA, herein designated VGAM RNA, also designated SEQ ID:4208.

[51722] Another function of VGAM1497 is therefore inhibition of Transcription Factor 12 (HTF4, helix-loop-helix transcription factors 4) (TCF12, Accession NM_003205), a gene which may play important roles during development of the nervous system as well as in other organ systems. Accordingly, utilities of VGAM1497 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCF12. The function of TCF12 and its association with various diseases and clinical conditions, has

been established by previous studies, as described herein above with reference to VGAM308.DKFZP564O043 (Accession XM_166502) is another VGAM1497 host target gene. DKFZP564O043 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564O043, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564O043 BINDING SITE, designated SEQ ID:44429, to the nucleotide sequence of VGAM1497 RNA, herein designated VGAM RNA, also designated SEQ ID:4208.

[51723] Another function of VGAM1497 is therefore inhibition of DKFZP564O043 (Accession XM_166502). Accordingly, utilities of VGAM1497 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564O043. HYA22 (Accession NM_005808) is another VGAM1497 host target gene. HYA22 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HYA22, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HYA22 BIND-

ING SITE, designated SEQ ID:12386, to the nucleotide sequence of VGAM1497 RNA, herein designated VGAM RNA, also designated SEQ ID:4208.

[51724] Another function of VGAM1497 is therefore inhibition of HYA22 (Accession NM_005808). Accordingly, utilities of VGAM1497 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HYA22. KIAA0652 (Accession NM_014741) is another VGAM1497 host target gene. KIAA0652 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0652, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0652 BINDING SITE, designated SEQ ID:16407, to the nucleotide sequence of VGAM1497 RNA, herein designated VGAM RNA, also designated SEQ ID:4208.

[51725] Another function of VGAM1497 is therefore inhibition of KIAA0652 (Accession NM_014741). Accordingly, utilities of VGAM1497 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0652. KIAA0836 (Accession XM_035390) is another VGAM1497 host target gene. KIAA0836 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0836, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0836 BINDING SITE, designated SEQ ID:32245, to the nucleotide sequence of VGAM1497 RNA, herein designated VGAM RNA, also designated SEQ ID:4208.

[51726] Another function of VGAM1497 is therefore inhibition of KIAA0836 (Accession XM_035390). Accordingly, utilities of VGAM1497 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0836. RCD-8 (Accession NM_014329) is another VGAM1497 host target gene. RCD-8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RCD-8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RCD-8 BINDING SITE, designated SEQ ID:15642, to the nucleotide sequence of VGAM1497 RNA, herein designated VGAM RNA, also designated SEQ ID:4208.

[51727] Another function of VGAM1497 is therefore inhibition of

RCD-8 (Accession NM_014329). Accordingly, utilities of VGAM1497 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RCD-8. Syntaxin 3A (STX3A, Accession NM_004177) is another VGAM1497 host target gene. STX3A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STX3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STX3A BINDING SITE, designated SEQ ID:10389, to the nucleotide sequence of VGAM1497 RNA, herein designated VGAM RNA, also designated SEQ ID:4208.

[51728] Another function of VGAM1497 is therefore inhibition of Syntaxin 3A (STX3A, Accession NM_004177). Accordingly, utilities of VGAM1497 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STX3A. LOC149134 (Accession XM_097594) is another VGAM1497 host target gene. LOC149134 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149134, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC149134 BINDING SITE, designated SEQ ID:40958, to the nucleotide sequence of VGAM1497 RNA, herein designated VGAM RNA, also designated SEQ ID:4208.

[51729] Another function of VGAM1497 is therefore inhibition of LOC149134 (Accession XM_097594). Accordingly, utilities of VGAM1497 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149134. LOC197335 (Accession XM_113866) is another VGAM1497 host target gene. LOC197335 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC197335, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197335 BINDING SITE, designated SEQ ID:42480, to the nucleotide sequence of VGAM1497 RNA, herein designated VGAM RNA, also designated SEQ ID:4208.

[51730] Another function of VGAM1497 is therefore inhibition of LOC197335 (Accession XM_113866). Accordingly, utilities of VGAM1497 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197335. LOC220522 (Accession XM_018306) is an-

other VGAM1497 host target gene. LOC220522 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220522, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220522 BINDING SITE, designated SEQ ID:30352, to the nucleotide sequence of VGAM1497 RNA, herein designated VGAM RNA, also designated SEQ ID:4208.

[51731] Another function of VGAM1497 is therefore inhibition of LOC220522 (Accession XM_018306). Accordingly, utilities of VGAM1497 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220522. LOC92573 (Accession XM_045884) is another VGAM1497 host target gene. LOC92573 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92573, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92573 BINDING SITE, designated SEQ ID:34593, to the nucleotide sequence of VGAM1497 RNA, herein designated VGAM RNA, also designated SEQ ID:4208.

[51732] Another function of VGAM1497 is therefore inhibition of LOC92573 (Accession XM_045884). Accordingly, utilities of VGAM1497 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92573. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1498 (VGAM1498) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51733] VGAM1498 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1498 was detected is described hereinabove with reference to Figs. 1–8.

[51734] VGAM1498 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine Herpesvirus 1. VGAM1498 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51735] VGAM1498 gene encodes a VGAM1498 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM1498 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1498 precursor RNA is designated SEQ ID:1484, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1484 is located at position 112274 relative to the genome of Alcelaphine Herpesvirus 1.

[51736] VGAM1498 precursor RNA folds onto itself, forming VGAM1498 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51737] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1498 folded precursor RNA into VGAM1498 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 52%) nucleotide sequence of VGAM1498 RNA is designated SEQ ID:4209, and is provided hereinbelow with reference to the sequence listing part.

[51738] VGAM1498 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1498 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1498 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[51739] VGAM1498 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1498 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1498 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1498 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1498 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[51740] The complementary binding of VGAM1498 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1498 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1498 host target RNA into VGAM1498 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51741] It is appreciated that VGAM1498 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1498 host target genes. The mRNA of each one of this plurality of VGAM1498 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1498 RNA, herein designated VGAM RNA, and which when bound by VGAM1498 RNA causes inhibition of translation of respective one or more VGAM1498 host target proteins.

[51742] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1498 gene, herein designated VGAM GENE, on one or more VGAM1498 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[51743] It is yet further appreciated that a function of VGAM1498 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1498 include diagnosis, prevention and treatment of viral infection by Alcelaphine Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1498 correlate with, and may be deduced from, the identity of the host target genes which VGAM1498 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51744] Nucleotide sequences of the VGAM1498 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1498 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1498 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1498 are further described hereinbelow with reference to Table 1.

[51745] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1498 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1498 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[51746] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1498 gene, herein designated VGAM is inhibition of expression of VGAM1498 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1498 correlate with, and may be deduced from, the identity of the target genes which VGAM1498 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[51747] CARP (Accession NM_014391) is a VGAM1498 host target gene. CARP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CARP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CARP BINDING SITE, designated SEQ ID:15720, to the nucleotide sequence of VGAM1498 RNA, herein designated VGAM RNA, also designated SEQ ID:4209.

[51748] A function of VGAM1498 is therefore inhibition of CARP (Accession NM_014391). Accordingly, utilities of VGAM1498 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CARP. CGTHBA (Accession NM_012075) is another VGAM1498

host target gene. CGTHBA BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CGTHBA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CGTHBA BINDING SITE, designated SEQ ID:14359, to the nucleotide sequence of VGAM1498 RNA, herein designated VGAM RNA, also designated SEQ ID:4209.

[51749] Another function of VGAM1498 is therefore inhibition of CGTHBA (Accession NM_012075). Accordingly, utilities of VGAM1498 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CGTHBA. Calponin 2 (CNN2, Accession NM_004368) is another VGAM1498 host target gene. CNN2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CNN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNN2 BINDING SITE, designated SEQ ID:10584, to the nucleotide sequence of VGAM1498 RNA, herein designated VGAM RNA, also designated SEQ ID:4209.

[51750] Another function of VGAM1498 is therefore inhibition of Calponin 2 (CNN2, Accession NM_004368), a gene which may be involved in the structural organization and/or anchorage of actin filaments. Accordingly, utilities of VGAM1498 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNN2. The function of CNN2 has been established by previous studies. Masuda et al. (1996) cloned a cDNA encoding calponin-2 (CNN2) by screening a human heart cDNA library with a CNN1 (OMIM Ref. No. 600806) cDNA. The CNN2 protein is 94.8% identical to mouse calponin h2 (see OMIM Ref. No. 600806), indicating that these proteins are homologs. The predicted CNN2 protein has 309 amino acids and a pI of 7.1. It contains motifs that are present in CNN1 and CNN3 (OMIM Ref. No. 602374): 3 tandem repeats of 29 amino acids, an actin-binding domain, a VAV (OMIM Ref. No. 164875)-homologous region, and 2 consensus phosphorylation sites for tyrosine kinase at the C terminus. The 3-prime untranslated region of the CNN2 mRNA contains an Alu repetitive sequence in the anti-sense direction. RT-PCR detected CNN2 transcripts in both cultured smooth muscle and nonmuscle cells and showed that mouse calponin h2 is expressed in embryonic

and adult heart. CNN2 protein localizes to the cell-to-cell junctions of cardiomyocytes and codistributes with vinculin (OMIM Ref. No. 193065). Masuda et al. (1996) suggested that CNN2 may be involved in the structural organization and/or anchorage of actin filaments and may function in the cell adhesion mechanism Cheng et al. (1994) mapped the CNN2 gene to 21q11.1 by hybridization to chromosome 21q-specific YACs.

[51751] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[51752] Masuda, H.; Tanaka, K.; Takagi, M.; Ohgami, K.; Sakamaki, T.; Shibata, N.; Takahashi, K. : Molecular cloning and characterization of human non-smooth muscle calponin. J. Biochem. 120: 415-424, 1996. ; and

[51753] Cheng, J.-F.; Boyartchuk, V.; Zhu, Y. : Isolation and mapping of human chromosome 21 cDNA: progress in constructing a chromosome 21 expression map. Genomics 23: 75-84, 1994.

[51754] Further studies establishing the function and utilities of CNN2 are found in John Hopkins OMIM database record ID 602373, and in cited publications numbered 8674 listed in the bibliography section hereinbelow, which are also

hereby incorporated by reference. Collagen, Type XV, Alpha 1 (COL15A1, Accession NM_001855) is another VGAM1498 host target gene. COL15A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by COL15A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COL15A1 BINDING SITE, designated SEQ ID:7589, to the nucleotide sequence of VGAM1498 RNA, herein designated VGAM RNA, also designated SEQ ID:4209.

[51755] Another function of VGAM1498 is therefore inhibition of Collagen, Type XV, Alpha 1 (COL15A1, Accession NM_001855), a gene which may be involved in maintaining the structure of connective tissue. Accordingly, utilities of VGAM1498 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL15A1. The function of COL15A1 and its association with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM304. Exostoses (multiple)-like 1 (EXTL1, Accession NM_004455) is another VGAM1498 host target gene. EXTL1 BINDING SITE is

HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by EXTL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EXTL1 BINDING SITE, designated SEQ ID:10755, to the nucleotide sequence of VGAM1498 RNA, herein designated VGAM RNA, also designated SEQ ID:4209.

[51756] Another function of VGAM1498 is therefore inhibition of Exostoses (multiple)-like 1 (EXTL1, Accession NM_004455), a gene which probably contribute to the synthesis of heparan sulfate and heparin. Accordingly, utilities of VGAM1498 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EXTL1. The function of EXTL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM806.Laminin, Gamma 1 (formerly LAMB2) (LAMC1, Accession NM_002293) is another VGAM1498 host target gene. LAMC1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LAMC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LAMC1 BINDING SITE, designated SEQ ID:8073, to the nucleotide sequence of VGAM1498 RNA, herein designated VGAM RNA, also designated SEQ ID:4209.

[51757] Another function of VGAM1498 is therefore inhibition of Laminin, Gamma 1 (formerly LAMB2) (LAMC1, Accession NM_002293), a gene which may mediate the attachment, migration, and organization of cells into tissues. Accordingly, utilities of VGAM1498 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LAMC1. The function of LAMC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM812.2'-5'-oligoadenylate Synthetase 2, 69/71kDa (OAS2, Accession NM_002535) is another VGAM1498 host target gene. OAS2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OAS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OAS2 BINDING SITE, designated SEQ ID:8373, to the nucleotide se-

quence of VGAM1498 RNA, herein designated VGAM RNA, also designated SEQ ID:4209.

[51758] Another function of VGAM1498 is therefore inhibition of 2'-5'-oligoadenylate Synthetase 2, 69/71kDa (OAS2, Accession NM_002535), a gene which may play a role in mediating resistance to virus infection, control of cell growth, differentiation, and apoptosis. Accordingly, utilities of VGAM1498 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OAS2. The function of OAS2 has been established by previous studies. The 2-prime,5-prime oligoadenylate synthetases (OASs) are interferon-induced proteins characterized by their capacity to catalyze the synthesis of 2-prime,5-prime oligomers of adenosine (2-5As). See OAS1 (OMIM Ref. No. 164350). Hovanessian et al. (1987) found that interferon-treated human cells contain several OASs corresponding to proteins of 40 (OAS1), 46 (OAS1), 69, and 100 (OMIM Ref. No. 603351) kD. Marie et al. (1989) generated highly specific polyclonal antibodies against p69, the 69-kD OAS. By screening an interferon-treated human cell expression library with the anti-p69 antibodies, Marie and Hovanessian (1992) isolated a partial OAS2 cDNA. They screened additional libraries with

the partial cDNA and recovered cDNAs encoding 2 OAS2 isoforms. The smaller isoform is encoded by 2 mRNAs that differ in the length of the 3-prime untranslated region. Northern blot analysis revealed that OAS2 is expressed as 4 interferon-induced mRNAs in human cells. The predicted OAS2 proteins have a common 683-amino acid sequence and different 3-prime termini. By SDS-PAGE of in vitro transcription/translation products, the authors showed that 2 isoforms have molecular masses of 69 and 71 kD. Both isoforms exhibited OAS activity in vitro. Sequence analysis indicated that OAS2 contains 2 OAS1-homologous domains separated by a proline-rich putative linker region. The N- and C-terminal domains are 41% and 53% identical to OAS1, respectively. Marie and Hovanessian (1992) suggested that the OAS2 gene derived from the fusion of 2 ancestral genes analogous to OAS1. By fluorescence in situ hybridization and by inclusion within mapped clones, Hovnanian et al. (1998) determined that the OAS1, OAS2, and OAS3 genes are clustered with a 130-kb region on 12q24.2.

[51759] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[51760] Hovnanian, A.; Rebouillat, D.; Mattei, M.-G.; Levy, E. R.; Marie, I.; Monaco, A. P.; Hovanessian, A. G. : The human 2-prime,5-prime-oligoadenylate synthetase locus is composed of three distinct genes clustered on chromosome 12q24.2 encoding the 100-, 69-, and 40-kDa forms. *Genomics* 52: 267-277, 1998. ; and

[51761] Marie, I.; Hovanessian, A. G. : The 69-kDa 2-5A synthetase is composed of two homologous and adjacent functional domains. *J. Biol. Chem.* 267: 9933-9939, 1992.

[51762] Further studies establishing the function and utilities of OAS2 are found in John Hopkins OMIM database record ID 603350, and in cited publications numbered 800 and 8010-8011 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. PBX/knotted 1 Homeobox 1 (PKNOX1, Accession NM_004571) is another VGAM1498 host target gene. PKNOX1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PKNOX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PKNOX1 BINDING SITE, designated SEQ ID:10912, to the nucleotide sequence of VGAM1498 RNA,

herein designated VGAM RNA, also designated SEQ ID:4209.

[51763] Another function of VGAM1498 is therefore inhibition of PBX/knotted 1 Homeobox 1 (PKNOX1, Accession NM_004571), a gene which may regulate gene expression and control cell differentiation. Accordingly, utilities of VGAM1498 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PKNOX1. The function of PKNOX1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM276. Proteasome (prosome, macropain) Activator Subunit 3 (PA28 gamma; Ki) (PSME3, Accession NM_005789) is another VGAM1498 host target gene. PSME3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PSME3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSME3 BINDING SITE, designated SEQ ID:12370, to the nucleotide sequence of VGAM1498 RNA, herein designated VGAM RNA, also designated SEQ ID:4209.

[51764] Another function of VGAM1498 is therefore inhibition of Proteasome (prosome, macropain) Activator Subunit 3 (PA28 gamma; Ki) (PSME3, Accession NM_005789), a gene which is the activator subunit of the proteasome (prosome macropain). Accordingly, utilities of VGAM1498 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSME3. The function of PSME3 has been established by previous studies. Patients with systemic lupus erythematosus (SLE; 152700) produce autoantibodies against a number of nuclear antigens, including SNRP70 (OMIM Ref. No. 180740), PCNA (OMIM Ref. No. 176740), CDR1 (OMIM Ref. No. 302650), and Ki. By screening a human placenta cDNA library with a probe obtained by screening a bovine retina cDNA library with anti-Ki sera from an SLE patient, Nikaido et al. (1990) isolated a cDNA encoding PSME3, which they called Ki. Sequence analysis predicted that the 254-amino acid, hydrophilic PSME3 protein contains a nuclear localization signal and has a molecular mass of approximately 30 kD, close to the 32 kD observed by Western blot analysis. PSME3 shares over 99% amino acid identity with the bovine sequence. RNA blot analysis of human placenta, bovine brain, and mouse embryos detected 3.0- and

1.5-kb PSME3 transcripts. By analysis of overlapping YAC contigs and by FISH, Albertsen et al. (1994) mapped the PSME3 gene to 17q12-q21. Kandil et al. (1997) mapped the mouse Psme3 gene to chromosome 14 using inter-specific backcross analysis.

[51765] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[51766] Nikaido, T.; Shimada, K.; Shibata, M.; Hata, M.; Sakamoto, M.; Takasaki, Y.; Sato, C.; Takahashi, T.; Nishida, Y. : Cloning and nucleotide sequence of cDNA for Ki antigen, a highly conserved nuclear protein detected with sera from patients with systemic lupus erythematosus. Clin. Exp. Immun. 79: 209-214, 1990. ; and

[51767] Albertsen, H. M.; Smith, S. A.; Mazoyer, S.; Fujimoto, E.; Stevens, J.; Williams, B.; Rodriguez, P.; Cropp, C. S.; Slijepcevic, P.; Carlson, M.; Robertson, M.; Bradley, P.; Lawrence, E.;

[51768] Further studies establishing the function and utilities of PSME3 are found in John Hopkins OMIM database record ID 605129, and in cited publications numbered 12201-7083 listed in the bibliography section hereinbelow, which are also hereby incorporated by refer-

ence.Solute Carrier Family 31 (copper transporters), Member 1 (SLC31A1, Accession NM_001859) is another VGAM1498 host target gene. SLC31A1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC31A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC31A1 BINDING SITE, designated SEQ ID:7601, to the nucleotide sequence of VGAM1498 RNA, herein designated VGAM RNA, also designated SEQ ID:4209.

[51769] Another function of VGAM1498 is therefore inhibition of Solute Carrier Family 31 (copper transporters), Member 1 (SLC31A1, Accession NM_001859), a gene which is involved in high-affinity copper uptake. Accordingly, utilities of VGAM1498 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC31A1. The function of SLC31A1 has been established by previous studies. Moller et al. (2000) found that cells expressing CTR1 but not those expressing CTR2 showed a dramatic hyperaccumulation of radioactive copper, comparable to that seen in fibroblasts from Menkes disease patients. However, in contrast to the Menkes syn-

drome fibroblasts, the CTR1-expressing fibroblasts had an efflux rate similar to normal fibroblasts. Animal model experiments lend further support to the function of SLC31A1. To test the hypothesis that CTR1 is required for copper delivery to mammalian cells, Kuo et al. (2001) inactivated the Ctr1 gene in mice by targeted mutagenesis. They observed early embryonic lethality in homozygous mutant embryos and a deficiency in copper uptake in the brains of heterozygous animals. A study of the spatial and temporal expression pattern of Ctr1 during mouse development and adulthood further showed that Ctr1 is ubiquitously transcribed with highest expression observed in the specialized epithelia of the choroid plexus and renal tubules and in connective tissues of the eye, ovary, and testis. Similarly, Lee et al. (2001) showed that the mouse Ctr1 gene encodes a component of the copper transport machinery and that mice heterozygous for Ctr1 exhibit tissue-specific defects in copper accumulation and in the activities of copper-dependent enzymes. Mice completely deficient for Ctr1 exhibited profound growth and developmental defects and died in utero in midgestation

[51770] It is appreciated that the abovementioned animal model for SLC31A1 is acknowledged by those skilled in the art as

a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[51771] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[51772] Lee, J.; Prohaska, J. R.; Thiele, D. J. : Essential role for mammalian copper transporter Ctr1 in copper homeostasis and embryonic development. Proc. Nat. Acad. Sci. 98: 6842–6847, 2001. ; and

[51773] Moller, L. B.; Petersen, C.; Lund, C.; Horn, N. : Characterization of the hCTR1 gene: genomic organization, functional expression, and identification of a highly homologous processed gen.

[51774] Further studies establishing the function and utilities of SLC31A1 are found in John Hopkins OMIM database record ID 603085, and in sited publications numbered 1071–1077 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. C16orf5 (Accession NM_013399) is another VGAM1498 host target gene. C16orf5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C16orf5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of C16orf5 BINDING SITE, designated SEQ ID:15054, to the nucleotide sequence of VGAM1498 RNA, herein designated VGAM RNA, also designated SEQ ID:4209.

[51775] Another function of VGAM1498 is therefore inhibition of C16orf5 (Accession NM_013399). Accordingly, utilities of VGAM1498 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C16orf5. DKFZP586G1122 (Accession XM_028643) is another VGAM1498 host target gene. DKFZP586G1122 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP586G1122, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP586G1122 BINDING SITE, designated SEQ ID:30725, to the nucleotide sequence of VGAM1498 RNA, herein designated VGAM RNA, also designated SEQ ID:4209.

[51776] Another function of VGAM1498 is therefore inhibition of DKFZP586G1122 (Accession XM_028643). Accordingly, utilities of VGAM1498 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with DKFZP586G1122. Dihydropyrimidinase-like 4 (DPYSL4, Accession NM_006426) is another VGAM1498 host target gene. DPYSL4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DPYSL4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DPYSL4 BINDING SITE, designated SEQ ID:13142, to the nucleotide sequence of VGAM1498 RNA, herein designated VGAM RNA, also designated SEQ ID:4209.

[51777] Another function of VGAM1498 is therefore inhibition of Dihydropyrimidinase-like 4 (DPYSL4, Accession NM_006426). Accordingly, utilities of VGAM1498 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DPYSL4. FLJ13848 (Accession NM_024771) is another VGAM1498 host target gene. FLJ13848 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13848, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of FLJ13848 BINDING SITE, designated SEQ ID:24134, to the nucleotide sequence of VGAM1498 RNA, herein designated VGAM RNA, also designated SEQ ID:4209.

[51778] Another function of VGAM1498 is therefore inhibition of FLJ13848 (Accession NM_024771). Accordingly, utilities of VGAM1498 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13848. FLJ14775 (Accession NM_032837) is another VGAM1498 host target gene. FLJ14775 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14775, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14775 BINDING SITE, designated SEQ ID:26617, to the nucleotide sequence of VGAM1498 RNA, herein designated VGAM RNA, also designated SEQ ID:4209.

[51779] Another function of VGAM1498 is therefore inhibition of FLJ14775 (Accession NM_032837). Accordingly, utilities of VGAM1498 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14775. FLJ20254 (Accession NM_017727) is another

VGAM1498 host target gene. FLJ20254 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20254, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20254 BINDING SITE, designated SEQ ID:19316, to the nucleotide sequence of VGAM1498 RNA, herein designated VGAM RNA, also designated SEQ ID:4209.

[51780] Another function of VGAM1498 is therefore inhibition of FLJ20254 (Accession NM_017727). Accordingly, utilities of VGAM1498 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20254. FLJ32752 (Accession NM_144666) is another VGAM1498 host target gene. FLJ32752 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ32752, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ32752 BINDING SITE, designated SEQ ID:29483, to the nucleotide sequence of VGAM1498 RNA, herein designated VGAM RNA, also designated SEQ ID:4209.

[51781] Another function of VGAM1498 is therefore inhibition of FLJ32752 (Accession NM_144666). Accordingly, utilities of VGAM1498 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32752. KIAA0738 (Accession NM_014719) is another VGAM1498 host target gene. KIAA0738 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0738, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0738 BINDING SITE, designated SEQ ID:16276, to the nucleotide sequence of VGAM1498 RNA, herein designated VGAM RNA, also designated SEQ ID:4209.

[51782] Another function of VGAM1498 is therefore inhibition of KIAA0738 (Accession NM_014719). Accordingly, utilities of VGAM1498 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0738. KIAA0953 (Accession XM_039733) is another VGAM1498 host target gene. KIAA0953 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0953, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0953 BINDING SITE, designated SEQ ID:33169, to the nucleotide sequence of VGAM1498 RNA, herein designated VGAM RNA, also designated SEQ ID:4209.

[51783] Another function of VGAM1498 is therefore inhibition of KIAA0953 (Accession XM_039733). Accordingly, utilities of VGAM1498 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0953. KIAA1867 (Accession XM_170675) is another VGAM1498 host target gene. KIAA1867 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1867, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1867 BINDING SITE, designated SEQ ID:45452, to the nucleotide sequence of VGAM1498 RNA, herein designated VGAM RNA, also designated SEQ ID:4209.

[51784] Another function of VGAM1498 is therefore inhibition of KIAA1867 (Accession XM_170675). Accordingly, utilities of VGAM1498 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1867. Karyopherin (importin) Beta 3 (KPNB3, Accession NM_002271) is another VGAM1498 host target gene. KPNB3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KPNB3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KPNB3 BINDING SITE, designated SEQ ID:8063, to the nucleotide sequence of VGAM1498 RNA, herein designated VGAM RNA, also designated SEQ ID:4209.

[51785] Another function of VGAM1498 is therefore inhibition of Karyopherin (importin) Beta 3 (KPNB3, Accession NM_002271). Accordingly, utilities of VGAM1498 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KPNB3. Praja 1 (PJA1, Accession NM_022368) is another VGAM1498 host target gene. PJA1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PJA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PJA1 BINDING SITE, designated SEQ ID:22756, to the nucleotide sequence of VGAM1498 RNA, herein

designated VGAM RNA, also designated SEQ ID:4209.

[51786] Another function of VGAM1498 is therefore inhibition of Praja 1 (PJA1, Accession NM_022368). Accordingly, utilities of VGAM1498 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PJA1. RAB3A Interacting Protein (rabin3)-like 1 (RAB3IL1, Accession NM_013401) is another VGAM1498 host target gene. RAB3IL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAB3IL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB3IL1 BINDING SITE, designated SEQ ID:15060, to the nucleotide sequence of VGAM1498 RNA, herein designated VGAM RNA, also designated SEQ ID:4209.

[51787] Another function of VGAM1498 is therefore inhibition of RAB3A Interacting Protein (rabin3)-like 1 (RAB3IL1, Accession NM_013401). Accordingly, utilities of VGAM1498 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB3IL1. SEC61A1 (Accession NM_013336) is another VGAM1498 host target gene. SEC61A1 BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by SEC61A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEC61A1 BINDING SITE, designated SEQ ID:14982, to the nucleotide sequence of VGAM1498 RNA, herein designated VGAM RNA, also designated SEQ ID:4209.

[51788] Another function of VGAM1498 is therefore inhibition of SEC61A1 (Accession NM_013336). Accordingly, utilities of VGAM1498 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEC61A1. SKIP (Accession NM_016532) is another VGAM1498 host target gene. SKIP BINDING SITE1 and SKIP BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SKIP, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SKIP BINDING SITE1 and SKIP BINDING SITE2, designated SEQ ID:18599 and SEQ ID:28262 respectively, to the nucleotide sequence of VGAM1498 RNA, herein designated VGAM RNA, also designated SEQ ID:4209.

[51789] Another function of VGAM1498 is therefore inhibition of SKIP (Accession NM_016532). Accordingly, utilities of VGAM1498 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SKIP. LOC146890 (Accession XM_097128) is another VGAM1498 host target gene. LOC146890 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC146890, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146890 BINDING SITE, designated SEQ ID:40765, to the nucleotide sequence of VGAM1498 RNA, herein designated VGAM RNA, also designated SEQ ID:4209.

[51790] Another function of VGAM1498 is therefore inhibition of LOC146890 (Accession XM_097128). Accordingly, utilities of VGAM1498 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146890. LOC148758 (Accession XM_086301) is another VGAM1498 host target gene. LOC148758 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC148758, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148758 BINDING SITE, designated SEQ ID:38586, to the nucleotide sequence of VGAM1498 RNA, herein designated VGAM RNA, also designated SEQ ID:4209.

[51791] Another function of VGAM1498 is therefore inhibition of LOC148758 (Accession XM_086301). Accordingly, utilities of VGAM1498 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148758. LOC149113 (Accession XM_086425) is another VGAM1498 host target gene. LOC149113 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149113, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149113 BINDING SITE, designated SEQ ID:38640, to the nucleotide sequence of VGAM1498 RNA, herein designated VGAM RNA, also designated SEQ ID:4209.

[51792] Another function of VGAM1498 is therefore inhibition of LOC149113 (Accession XM_086425). Accordingly, utilities of VGAM1498 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC149113. LOC154403 (Accession XM_087919) is another VGAM1498 host target gene. LOC154403 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC154403, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154403 BINDING SITE, designated SEQ ID:39468, to the nucleotide sequence of VGAM1498 RNA, herein designated VGAM RNA, also designated SEQ ID:4209.

[51793] Another function of VGAM1498 is therefore inhibition of LOC154403 (Accession XM_087919). Accordingly, utilities of VGAM1498 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154403. LOC154992 (Accession XM_088106) is another VGAM1498 host target gene. LOC154992 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC154992, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154992 BINDING SITE, designated SEQ ID:39518, to the nucleotide sequence of VGAM1498 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4209.

[51794] Another function of VGAM1498 is therefore inhibition of LOC154992 (Accession XM_088106). Accordingly, utilities of VGAM1498 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154992. LOC201868 (Accession XM_114393) is another VGAM1498 host target gene. LOC201868 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC201868, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201868 BINDING SITE, designated SEQ ID:42921, to the nucleotide sequence of VGAM1498 RNA, herein designated VGAM RNA, also designated SEQ ID:4209.

[51795] Another function of VGAM1498 is therefore inhibition of LOC201868 (Accession XM_114393). Accordingly, utilities of VGAM1498 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201868. LOC222068 (Accession XM_166556) is another VGAM1498 host target gene. LOC222068 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC222068, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222068 BINDING SITE, designated SEQ ID:44537, to the nucleotide sequence of VGAM1498 RNA, herein designated VGAM RNA, also designated SEQ ID:4209.

[51796] Another function of VGAM1498 is therefore inhibition of LOC222068 (Accession XM_166556). Accordingly, utilities of VGAM1498 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222068. LOC93052 (Accession XM_048905) is another VGAM1498 host target gene. LOC93052 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC93052, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93052 BINDING SITE, designated SEQ ID:35300, to the nucleotide sequence of VGAM1498 RNA, herein designated VGAM RNA, also designated SEQ ID:4209.

[51797] Another function of VGAM1498 is therefore inhibition of LOC93052 (Accession XM_048905). Accordingly, utilities of VGAM1498 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC93052. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1499 (VGAM1499) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51798] VGAM1499 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1499 was detected is described hereinabove with reference to Figs. 1–8.

[51799] VGAM1499 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Alcelaphine Herpesvirus 1. VGAM1499 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51800] VGAM1499 gene encodes a VGAM1499 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1499 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1499 precursor RNA is desig-

nated SEQ ID:1485, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1485 is located at position 110926 relative to the genome of Alcelaphine Herpesvirus 1.

- [51801] VGAM1499 precursor RNA folds onto itself, forming VGAM1499 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [51802] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1499 folded precursor RNA into VGAM1499 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 60%) nucleotide sequence of VGAM1499 RNA is designated SEQ ID:4210, and is provided hereinbelow with reference to the sequence

listing part.

[51803] VGAM1499 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1499 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1499 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[51804] VGAM1499 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1499 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1499 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1499 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM1499 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[51805] The complementary binding of VGAM1499 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1499 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1499 host target RNA into VGAM1499 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51806] It is appreciated that VGAM1499 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1499 host target genes. The mRNA of each one of this plurality of VGAM1499 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1499 RNA, herein designated VGAM

RNA, and which when bound by VGAM1499 RNA causes inhibition of translation of respective one or more VGAM1499 host target proteins.

[51807] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1499 gene, herein designated VGAM GENE, on one or more VGAM1499 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[51808] It is yet further appreciated that a function of VGAM1499 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1499 include diagnosis, prevention and treatment of viral infection by Alcelaphine Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1499 correlate with, and may be deduced from, the identity of the host target genes which VGAM1499 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51809] Nucleotide sequences of the VGAM1499 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1499 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1499 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1499 are further described hereinbelow with reference to Table 1.

[51810] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1499 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1499 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51811] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1499 gene, herein designated VGAM is

inhibition of expression of VGAM1499 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1499 correlate with, and may be deduced from, the identity of the target genes which VGAM1499 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[51812] Cyclin-dependent Kinase Inhibitor 1B (p27, Kip1) (CDKN1B, Accession NM_004064) is a VGAM1499 host target gene. CDKN1B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CDKN1B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDKN1B BINDING SITE, designated SEQ ID:10272, to the nucleotide sequence of VGAM1499 RNA, herein designated VGAM RNA, also designated SEQ ID:4210.

[51813] A function of VGAM1499 is therefore inhibition of Cyclin-dependent Kinase Inhibitor 1B (p27, Kip1) (CDKN1B, Accession NM_004064), a gene which is involved in g1 arrest and may mediate tgf beta-induced g1 arrest. Accordingly, utilities of VGAM1499 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with CDKN1B. The function of CDKN1B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM592. Empty Spiracles Homolog 2 (Drosophila) (EMX2, Accession XM_113640) is another VGAM1499 host target gene. EMX2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EMX2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EMX2 BINDING SITE, designated SEQ ID:42314, to the nucleotide sequence of VGAM1499 RNA, herein designated VGAM RNA, also designated SEQ ID:4210.

[51814] Another function of VGAM1499 is therefore inhibition of Empty Spiracles Homolog 2 (Drosophila) (EMX2, Accession XM_113640), a gene which may function in combinations with otx1/2 to specify cell fates in the developing central nervous system. Accordingly, utilities of VGAM1499 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EMX2. The function of EMX2 and its association with various diseases and clinical conditions, has been established by previous studies, as

described hereinabove with reference to VGAM510. Lysosomal-associated Membrane Protein 2 (LAMP2, Accession NM_013995) is another VGAM1499 host target gene. LAMP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LAMP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LAMP2 BINDING SITE, designated SEQ ID:15183, to the nucleotide sequence of VGAM1499 RNA, herein designated VGAM RNA, also designated SEQ ID:4210.

[51815] Another function of VGAM1499 is therefore inhibition of Lysosomal-associated Membrane Protein 2 (LAMP2, Accession NM_013995). Accordingly, utilities of VGAM1499 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LAMP2. Paired Box Gene 6 (aniridia, keratitis) (PAX6, Accession NM_000280) is another VGAM1499 host target gene. PAX6 BINDING SITE1 and PAX6 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PAX6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Ta-

ble 2 illustrates the complementarity of the nucleotide sequences of PAX6 BINDING SITE1 and PAX6 BINDING SITE2, designated SEQ ID:5825 and SEQ ID:7309 respectively, to the nucleotide sequence of VGAM1499 RNA, herein designated VGAM RNA, also designated SEQ ID:4210.

[51816] Another function of VGAM1499 is therefore inhibition of Paired Box Gene 6 (aniridia, keratitis) (PAX6, Accession NM_000280), a gene which involves in oculogenesis. Accordingly, utilities of VGAM1499 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAX6. The function of PAX6 has been established by previous studies. PAX6 is a member of the paired box gene family and encodes a transcriptional regulator involved in oculogenesis, pancreatic, pituitary and central nervous system development. Hanson and Van Heyningen (1995) reviewed the work on PAX6 in man, mouse, and *Drosophila*. A chronology was provided, beginning with identification of the 'paired' gene as a key regulator of segmentation in *Drosophila* in 1980 to the discovery by Halder et al. (1995) that ectopic expression of *Drosophila* Pax6 induces ectopic eye development. Wawersik and Maas (2000) reviewed the role of Pax6 and other genes in vertebrate and fly oculogenesis. Animal

model experiments lend further support to the function of PAX6. Lyon (1988) suggested that 'small eye' (Sey) in the mouse, which is on chromosome 2, may be homologous to aniridia type II (OMIM Ref. No. 106210) inasmuch as there is a region of conserved homology of synteny between human 11p and mouse chromosome 2. This suggestion was corroborated by van der Meer-de Jong et al. (1990) who found through interspecies backcrosses for linkage mapping that the Sey gene lies between Fshb and Cas-1. In the human, AN2 lies between the 2 cognate genes, FSHB and CAT. Glaser et al. (1990) studied the Sey mutation by localizing in an interspecies backcross between *Mus musculus*/domesticus and *Mus spretus*, the region on mouse chromosome 2 carrying 9 evolutionarily conserved DNA clones from proximal human 11p. In Dickie's small eye, they found deletion of 3 clones that encompass the aniridia (AN2) and Wilms tumor susceptibility genes in man. Unlike their human counterparts, the heterozygous Dickie's small eye mice do not develop nephroblastomas. The homology of Sey and AN2 was established by the cloning of the AN2 gene in the human and its homolog in the mouse, and the demonstration of mutations in 3 independent Sey alleles (Hill et al., 1991).

The mutations would predictably disrupt the function of the gene, which belongs to the Pax multigene family. This family of developmental genes was first described in *Drosophila*. A Pax gene referred to as Pax6 is identical to the mouse homolog of the candidate aniridia gene. Matsuo et al. (1993) found an internal deletion of about 600 bp in the Pax6 gene in rats homozygous for the small eye mutation. Deletion was due to a single base insertion that generated an abnormal 5-prime donor splice site. They showed that anterior midbrain crest cells in the homozygous embryos reached the eye rudiments but did not migrate any further to the nasal rudiments, suggesting that the Pax6 gene is involved in conducting migration of neural crest cells from the anterior midbrain.

[51817] It is appreciated that the abovementioned animal model for PAX6 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[51818] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[51819] Wawersik, S.; Maas, R. L. : Vertebrate eye development as modeled in *Drosophila*. *Hum. Molec. Genet.* 9: 917–925,

2000. ; and

[51821] Further studies establishing the function and utilities of PAX6 are found in John Hopkins OMIM database record ID 607108, and in cited publications numbered 5548, 12160, 8112, 12161, 12310–12313, 5586–5588, 11658–5590, 12314, 12315, 12316–12317, 5593–5595, 12318, 12319–12320, 6139, 12162, 12321–12323, 5575, 12324, 12325–5497, 10763, 12326, 12329, 12327–550 and 1 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Down Syndrome Critical Region Gene 1–like 1 (DSCR1L1, Accession NM_005822) is another VGAM1499 host target gene. DSCR1L1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DSCR1L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DSCR1L1 BINDING SITE, designated SEQ ID:12427, to the nucleotide sequence of VGAM1499 RNA, herein designated VGAM RNA, also des–

ignated SEQ ID:4210.

[51822] Another function of VGAM1499 is therefore inhibition of Down Syndrome Critical Region Gene 1-like 1 (DSCR1L1, Accession NM_005822). Accordingly, utilities of VGAM1499 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DSCR1L1. FLJ14906 (Accession NM_032859) is another VGAM1499 host target gene. FLJ14906 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14906, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14906 BINDING SITE, designated SEQ ID:26663, to the nucleotide sequence of VGAM1499 RNA, herein designated VGAM RNA, also designated SEQ ID:4210.

[51823] Another function of VGAM1499 is therefore inhibition of FLJ14906 (Accession NM_032859). Accordingly, utilities of VGAM1499 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14906. FLJ22794 (Accession XM_166220) is another VGAM1499 host target gene. FLJ22794 BINDING SITE is HOST TARGET binding site found in the 5' untranslated

region of mRNA encoded by FLJ22794, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22794 BINDING SITE, designated SEQ ID:44029, to the nucleotide sequence of VGAM1499 RNA, herein designated VGAM RNA, also designated SEQ ID:4210.

[51824] Another function of VGAM1499 is therefore inhibition of FLJ22794 (Accession XM_166220). Accordingly, utilities of VGAM1499 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22794. KIAA0471 (Accession NM_014857) is another VGAM1499 host target gene. KIAA0471 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0471, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0471 BINDING SITE, designated SEQ ID:16911, to the nucleotide sequence of VGAM1499 RNA, herein designated VGAM RNA, also designated SEQ ID:4210.

[51825] Another function of VGAM1499 is therefore inhibition of KIAA0471 (Accession NM_014857). Accordingly, utilities

of VGAM1499 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0471. KIAA1456 (Accession XM_040100) is another VGAM1499 host target gene. KIAA1456 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1456, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1456 BINDING SITE, designated SEQ ID:33263, to the nucleotide sequence of VGAM1499 RNA, herein designated VGAM RNA, also designated SEQ ID:4210.

[51826] Another function of VGAM1499 is therefore inhibition of KIAA1456 (Accession XM_040100). Accordingly, utilities of VGAM1499 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1456. PRO1768 (Accession NM_014099) is another VGAM1499 host target gene. PRO1768 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRO1768, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1768

BINDING SITE, designated SEQ ID:15322, to the nucleotide sequence of VGAM1499 RNA, herein designated VGAM RNA, also designated SEQ ID:4210.

[51827] Another function of VGAM1499 is therefore inhibition of PRO1768 (Accession NM_014099). Accordingly, utilities of VGAM1499 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1768. S164 (Accession XM_027330) is another VGAM1499 host target gene. S164 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by S164, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of S164 BINDING SITE, designated SEQ ID:30481, to the nucleotide sequence of VGAM1499 RNA, herein designated VGAM RNA, also designated SEQ ID:4210.

[51828] Another function of VGAM1499 is therefore inhibition of S164 (Accession XM_027330). Accordingly, utilities of VGAM1499 include diagnosis, prevention and treatment of diseases and clinical conditions associated with S164. SP329 (Accession NM_030793) is another VGAM1499 host target gene. SP329 BINDING SITE is HOST TARGET binding

site found in the 5` untranslated region of mRNA encoded by SP329, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SP329 BINDING SITE, designated SEQ ID:25097, to the nucleotide sequence of VGAM1499 RNA, herein designated VGAM RNA, also designated SEQ ID:4210.

[51829] Another function of VGAM1499 is therefore inhibition of SP329 (Accession NM_030793). Accordingly, utilities of VGAM1499 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SP329. LOC123443 (Accession XM_058707) is another VGAM1499 host target gene. LOC123443 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC123443, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC123443 BINDING SITE, designated SEQ ID:36725, to the nucleotide sequence of VGAM1499 RNA, herein designated VGAM RNA, also designated SEQ ID:4210.

[51830] Another function of VGAM1499 is therefore inhibition of

LOC123443 (Accession XM_058707). Accordingly, utilities of VGAM1499 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC123443. LOC130535 (Accession XM_072244) is another VGAM1499 host target gene. LOC130535 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC130535, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130535 BINDING SITE, designated SEQ ID:37476, to the nucleotide sequence of VGAM1499 RNA, herein designated VGAM RNA, also designated SEQ ID:4210.

[51831] Another function of VGAM1499 is therefore inhibition of LOC130535 (Accession XM_072244). Accordingly, utilities of VGAM1499 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130535. LOC130813 (Accession XM_065904) is another VGAM1499 host target gene. LOC130813 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC130813, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC130813 BINDING SITE, designated SEQ ID:37311, to the nucleotide sequence of VGAM1499 RNA, herein designated VGAM RNA, also designated SEQ ID:4210.

[51832] Another function of VGAM1499 is therefore inhibition of LOC130813 (Accession XM_065904). Accordingly, utilities of VGAM1499 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130813. LOC149301 (Accession XM_086480) is another VGAM1499 host target gene. LOC149301 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149301, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149301 BINDING SITE, designated SEQ ID:38686, to the nucleotide sequence of VGAM1499 RNA, herein designated VGAM RNA, also designated SEQ ID:4210.

[51833] Another function of VGAM1499 is therefore inhibition of LOC149301 (Accession XM_086480). Accordingly, utilities of VGAM1499 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149301. LOC164382 (Accession XM_104390) is an-

other VGAM1499 host target gene. LOC164382 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC164382, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC164382 BINDING SITE, designated SEQ ID:42159, to the nucleotide sequence of VGAM1499 RNA, herein designated VGAM RNA, also designated SEQ ID:4210.

[51834] Another function of VGAM1499 is therefore inhibition of LOC164382 (Accession XM_104390). Accordingly, utilities of VGAM1499 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC164382. LOC203523 (Accession XM_114713) is another VGAM1499 host target gene. LOC203523 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203523, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203523 BINDING SITE, designated SEQ ID:43053, to the nucleotide sequence of VGAM1499 RNA, herein designated VGAM RNA, also designated SEQ ID:4210.

[51835] Another function of VGAM1499 is therefore inhibition of LOC203523 (Accession XM_114713). Accordingly, utilities of VGAM1499 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203523. LOC85479 (Accession NM_033105) is another VGAM1499 host target gene. LOC85479 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC85479, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC85479 BINDING SITE, designated SEQ ID:26958, to the nucleotide sequence of VGAM1499 RNA, herein designated VGAM RNA, also designated SEQ ID:4210.

[51836] Another function of VGAM1499 is therefore inhibition of LOC85479 (Accession NM_033105). Accordingly, utilities of VGAM1499 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC85479. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1500 (VGAM1500) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[51837] VGAM1500 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1500 was detected is described hereinabove with reference to Figs. 1-8.

[51838] VGAM1500 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Aphid Lethal Paralysis Virus. VGAM1500 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51839] VGAM1500 gene encodes a VGAM1500 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1500 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1500 precursor RNA is designated SEQ ID:1486, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1486 is located at position 3755 relative to the genome of Aphid Lethal Paralysis Virus.

[51840] VGAM1500 precursor RNA folds onto itself, forming VGAM1500 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51841] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1500 folded precursor RNA into VGAM1500 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM1500 RNA is designated SEQ ID:4211, and is provided hereinbelow with reference to the sequence listing part.

[51842] VGAM1500 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1500 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1500 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[51843] VGAM1500 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1500 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1500 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1500 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1500 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[51844] The complementary binding of VGAM1500 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1500 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1500 host target RNA into VGAM1500 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51845] It is appreciated that VGAM1500 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1500 host target genes. The mRNA of each one of this plurality of VGAM1500 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1500 RNA, herein designated VGAM RNA, and which when bound by VGAM1500 RNA causes inhibition of translation of respective one or more VGAM1500 host target proteins.

[51846] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1500 gene, herein designated VGAM GENE, on one or more VGAM1500 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[51847] It is yet further appreciated that a function of VGAM1500 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1500 include diagnosis, prevention and treatment of viral infection by Aphid Lethal Paralysis Virus. Specific functions, and accordingly utilities, of VGAM1500 correlate with, and may be deduced from, the identity of the host target genes which VGAM1500 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[51848] Nucleotide sequences of the VGAM1500 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1500 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1500 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1500 are further described hereinbelow with reference to Table 1.

[51849] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1500 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1500 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51850] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1500 gene, herein designated VGAM is inhibition of expression of VGAM1500 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1500 correlate with, and may be deduced from, the identity of the target genes which VGAM1500 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[51851] Chromosome Condensation 1-like (CHC1L, Accession NM_001268) is a VGAM1500 host target gene. CHC1L BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CHC1L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHC1L BINDING SITE, designated SEQ ID:6932, to the nucleotide sequence of VGAM1500 RNA, herein designated VGAM RNA, also designated SEQ ID:4211.

[51852] A function of VGAM1500 is therefore inhibition of Chromosome Condensation 1-like (CHC1L, Accession NM_001268). Accordingly, utilities of VGAM1500 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHC1L. Dystroglycan 1 (dystrophin-associated glycoprotein 1) (DAG1, Accession NM_004393) is another VGAM1500 host target gene. DAG1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DAG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAG1 BINDING SITE, designated SEQ ID:10632,

to the nucleotide sequence of VGAM1500 RNA, herein designated VGAM RNA, also designated SEQ ID:4211.

[51853] Another function of VGAM1500 is therefore inhibition of Dystroglycan 1 (dystrophin-associated glycoprotein 1) (DAG1, Accession NM_004393), a gene which may provide linkage between the sarcolemma and extracellular matrix (ECM). Accordingly, utilities of VGAM1500 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAG1. The function of DAG1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1095.F-box and Leucine-rich Repeat Protein 11 (FBXL11, Accession NM_012308) is another VGAM1500 host target gene. FBXL11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FBXL11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBXL11 BINDING SITE, designated SEQ ID:14681, to the nucleotide sequence of VGAM1500 RNA, herein designated VGAM RNA, also designated SEQ ID:4211.

[51854] Another function of VGAM1500 is therefore inhibition of F-box and Leucine-rich Repeat Protein 11 (FBXL11, Accession NM_012308), a gene which are BTB/POZ domain-containing zinc finger proteins implicated in oncogenesis. Accordingly, utilities of VGAM1500 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXL11. The function of FBXL11 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM404. Vacuolar Protein Sorting 26 (yeast) (VPS26, Accession NM_004896) is another VGAM1500 host target gene. VPS26 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by VPS26, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VPS26 BINDING SITE, designated SEQ ID:11327, to the nucleotide sequence of VGAM1500 RNA, herein designated VGAM RNA, also designated SEQ ID:4211.

[51855] Another function of VGAM1500 is therefore inhibition of Vacuolar Protein Sorting 26 (yeast) (VPS26, Accession NM_004896), a gene which is a sorting protein– ensures

the proper delivery of organelle-specific proteins. Accordingly, utilities of VGAM1500 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VPS26. The function of VPS26 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM315. KIAA0555 (Accession NM_014790) is another VGAM1500 host target gene. KIAA0555 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0555, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0555 BINDING SITE, designated SEQ ID:16684, to the nucleotide sequence of VGAM1500 RNA, herein designated VGAM RNA, also designated SEQ ID:4211.

[51856] Another function of VGAM1500 is therefore inhibition of KIAA0555 (Accession NM_014790). Accordingly, utilities of VGAM1500 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0555. Zinc Finger Protein 185 (LIM domain) (ZNF185, Accession NM_007150) is another VGAM1500 host target

gene. ZNF185 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF185, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF185 BINDING SITE, designated SEQ ID:14003, to the nucleotide sequence of VGAM1500 RNA, herein designated VGAM RNA, also designated SEQ ID:4211.

[51857] Another function of VGAM1500 is therefore inhibition of Zinc Finger Protein 185 (LIM domain) (ZNF185, Accession NM_007150). Accordingly, utilities of VGAM1500 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF185. LOC115265 (Accession XM_055596) is another VGAM1500 host target gene. LOC115265 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC115265, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115265 BINDING SITE, designated SEQ ID:36309, to the nucleotide sequence of VGAM1500 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4211.

[51858] Another function of VGAM1500 is therefore inhibition of LOC115265 (Accession XM_055596). Accordingly, utilities of VGAM1500 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115265. LOC257407 (Accession XM_173078) is another VGAM1500 host target gene. LOC257407 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257407, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257407 BINDING SITE, designated SEQ ID:46337, to the nucleotide sequence of VGAM1500 RNA, herein designated VGAM RNA, also designated SEQ ID:4211.

[51859] Another function of VGAM1500 is therefore inhibition of LOC257407 (Accession XM_173078). Accordingly, utilities of VGAM1500 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257407. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1501 (VGAM1501) viral gene, which

modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51860] VGAM1501 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1501 was detected is described hereinabove with reference to Figs. 1–8.

[51861] VGAM1501 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Aphid Lethal Paralysis Virus. VGAM1501 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51862] VGAM1501 gene encodes a VGAM1501 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1501 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1501 precursor RNA is designated SEQ ID:1487, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1487 is located at position 1260 relative to the genome of Aphid Lethal Paralysis Virus.

[51863] VGAM1501 precursor RNA folds onto itself, forming

VGAM1501 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51864] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1501 folded precursor RNA into VGAM1501 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM1501 RNA is designated SEQ ID:4212, and is provided hereinbelow with reference to the sequence listing part.

[51865] VGAM1501 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1501 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1501 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[51866] VGAM1501 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1501 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1501 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1501 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1501 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[51867] The complementary binding of VGAM1501 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1501 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1501 host target RNA into VGAM1501 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51868] It is appreciated that VGAM1501 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1501 host target genes. The mRNA of each one of this plurality of VGAM1501 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1501 RNA, herein designated VGAM RNA, and which when bound by VGAM1501 RNA causes inhibition of translation of respective one or more VGAM1501 host target proteins.

[51869] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1501 gene, herein designated VGAM GENE, on one or more VGAM1501 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[51870] It is yet further appreciated that a function of VGAM1501 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1501 include diagnosis, prevention and treatment of viral infection by Aphid Lethal Paralysis Virus. Specific functions, and accordingly utilities, of VGAM1501 correlate with, and may be deduced from, the identity of the host target genes which VGAM1501 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[51871] Nucleotide sequences of the VGAM1501 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1501 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1501 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1501 are further described hereinbelow with reference to Table 1.

[51872] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1501 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1501 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51873] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1501 gene, herein designated VGAM is inhibition of expression of VGAM1501 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1501 correlate with, and may be deduced from, the identity of the target genes which VGAM1501 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[51874] Chromosome 20 Open Reading Frame 12 (C20orf12, Accession NM_018152) is a VGAM1501 host target gene. C20orf12 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by C20orf12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf12 BINDING SITE, designated SEQ ID:19955, to the nucleotide sequence of VGAM1501 RNA, herein designated VGAM RNA, also designated SEQ ID:4212.

[51875] A function of VGAM1501 is therefore inhibition of Chromosome 20 Open Reading Frame 12 (C20orf12, Accession NM_018152). Accordingly, utilities of VGAM1501 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf12. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1502 (VGAM1502) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51876] VGAM1502 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1502 was detected is described hereinabove with reference to Figs. 1–8.

[51877] VGAM1502 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Aphid Lethal Paralysis Virus. VGAM1502 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51878] VGAM1502 gene encodes a VGAM1502 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1502 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1502 precursor RNA is designated SEQ ID:1488, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1488 is located at position 1441 relative to the genome of Aphid Lethal Paralysis Virus.

[51879] VGAM1502 precursor RNA folds onto itself, forming VGAM1502 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51880] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1502 folded precursor RNA into VGAM1502 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 60%) nucleotide sequence of VGAM1502 RNA is designated SEQ ID:4213, and is provided hereinbelow with reference to the sequence listing part.

[51881] VGAM1502 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1502 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1502 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[51882] VGAM1502 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1502 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1502 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1502 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1502 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[51883] The complementary binding of VGAM1502 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1502 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1502 host target RNA into VGAM1502 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51884] It is appreciated that VGAM1502 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1502 host target genes. The mRNA of each one of this plurality of VGAM1502 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1502 RNA, herein designated VGAM RNA, and which when bound by VGAM1502 RNA causes inhibition of translation of respective one or more VGAM1502 host target proteins.

[51885] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1502 gene, herein designated VGAM GENE, on one or more VGAM1502 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[51886] It is yet further appreciated that a function of VGAM1502 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1502 include diagnosis, prevention and treatment of viral infection by Aphid Lethal Paralysis Virus. Specific functions, and accordingly utilities, of VGAM1502 correlate with, and may be deduced from, the identity of the host target genes which VGAM1502 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51887] Nucleotide sequences of the VGAM1502 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the
`diced` VGAM1502 RNA, herein designated VGAM RNA,
and a schematic representation of the secondary folding
of VGAM1502 folded precursor RNA, herein designated
VGAM FOLDED PRECURSOR RNA, of VGAM1502 are further
described hereinbelow with reference to Table 1.

[51888] Nucleotide sequences of host target binding sites, such as
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of
Fig. 1, found on VGAM1502 host target RNA, and
schematic representation of the complementarity of each
of these host target binding sites to VGAM1502 RNA,
herein designated VGAM RNA, are described hereinbelow
with reference to Table 2.

[51889] As mentioned hereinabove with reference to Fig. 1, a
function of VGAM1502 gene, herein designated VGAM is
inhibition of expression of VGAM1502 target genes. It is
appreciated that specific functions, and accordingly utili-
ties, of VGAM1502 correlate with, and may be deduced
from, the identity of the target genes which VGAM1502
binds and inhibits, and the function of these target genes,
as elaborated hereinbelow.

[51890] Desmocollin 1 (DSC1, Accession NM_024421) is a
VGAM1502 host target gene. DSC1 BINDING SITE1 and

DSC1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DSC1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DSC1 BINDING SITE1 and DSC1 BINDING SITE2, designated SEQ ID:23660 and SEQ ID:11390 respectively, to the nucleotide sequence of VGAM1502 RNA, herein designated VGAM RNA, also designated SEQ ID:4213.

[51891] A function of VGAM1502 is therefore inhibition of Desmocollin 1 (DSC1, Accession NM_024421), a gene which is a component of intercellular desmosome junctions. Accordingly, utilities of VGAM1502 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DSC1. The function of DSC1 has been established by previous studies. The desmosome is a complex adhesive structure that plays a fundamental role in maintaining the strength and integrity of epithelial tissues. Central to this role are transmembrane glycoproteins that mediate cell-cell adhesion at the extracellular surface and interact with the cytoskeleton (via components of the desmosomal plaque), thus linking the intermediate filament networks of adjacent cells. Desmosomal glycopro-

teins comprise 2 distinct groups, the desmogleins and the desmocollins, both of which are members of the cadherin superfamily of Ca^{2+} -dependent cell adhesion molecules. In the human, 2 types of desmocollins had been identified, symbolized DSC1 and DSC2 (OMIM Ref. No. 125645), and each occurs in 2 alternatively spliced forms (variants a and b) that have different cytoplasmic domains reflecting different interactions with components of the desmosomal plaque (Trojanovsky et al., 1993). King et al. (1993) isolated cDNA clones encoding a human desmocollin that is expressed in the more differentiated layers of human epidermis. This isoform has 53% amino acid identity with the previously isolated type 3 desmocollin, which is expressed in the basal layers of the epidermis. However, the N and C termini of the mature proteins are more highly conserved. Using a panel of somatic cell hybrids, King et al. (1993) assigned the DSC1 gene to chromosome 18, where the DSC2 gene and the 3 desmoglein genes (DSG1, 125670; DSG2, 125671; DSG3, 169615) had previously been mapped.

[51892] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [51893] King, I. A.; Arnemann, J.; Spurr, N. K.; Buxton, R. S. : Cloning of the cDNA (DSC1) coding for human type 1 desmocollin and its assignment to chromosome 18. *Genomics* 18: 185–194, 1993. ; and
- [51894] Troyanovsky, S. M.; Eshkind, L. G.; Troyanovsky, R. B.; Leube, R. E.; Franke, W. W. : Contributions of cytoplasmic domains of desmosomal cadherins to desmosome assembly and intermediate.
- [51895] Further studies establishing the function and utilities of DSC1 are found in John Hopkins OMIM database record ID 125643, and in cited publications numbered 359–360 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Replication Protein A1, 70kDa (RPA1, Accession NM_002945) is another VGAM1502 host target gene. RPA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RPA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RPA1 BINDING SITE, designated SEQ ID:8856, to the nucleotide sequence of VGAM1502 RNA, herein designated VGAM RNA, also designated SEQ ID:4213.

[51896] Another function of VGAM1502 is therefore inhibition of Replication Protein A1, 70kDa (RPA1, Accession NM_002945), a gene which is required for simian virus 40 dna replication in vitro. it participates in a very early step in initiation. rp-a is a single-stranded dna-binding protein. Accordingly, utilities of VGAM1502 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPA1. The function of RPA1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM180. Tumor Necrosis Factor (ligand) Superfamily, Member 8 (TNFSF8, Accession NM_001244) is another VGAM1502 host target gene. TNFSF8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TNFSF8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFSF8 BINDING SITE, designated SEQ ID:6916, to the nucleotide sequence of VGAM1502 RNA, herein designated VGAM RNA, also designated SEQ ID:4213.

[51897] Another function of VGAM1502 is therefore inhibition of

Tumor Necrosis Factor (ligand) Superfamily, Member 8 (TNFSF8, Accession NM_001244), a gene which cytokine that binds to tnfrsf8/cd30. induces proliferation of t cells. Accordingly, utilities of VGAM1502 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFSF8. The function of TNFSF8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM655. BRAL1 (Accession NM_021817) is another VGAM1502 host target gene. BRAL1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by BRAL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BRAL1 BINDING SITE, designated SEQ ID:22395, to the nucleotide sequence of VGAM1502 RNA, herein designated VGAM RNA, also designated SEQ ID:4213.

[51898] Another function of VGAM1502 is therefore inhibition of BRAL1 (Accession NM_021817). Accordingly, utilities of VGAM1502 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BRAL1.

FLJ12838 (Accession NM_024641) is another VGAM1502 host target gene. FLJ12838 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12838, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12838 BINDING SITE, designated SEQ ID:23926, to the nucleotide sequence of VGAM1502 RNA, herein designated VGAM RNA, also designated SEQ ID:4213.

[51899] Another function of VGAM1502 is therefore inhibition of FLJ12838 (Accession NM_024641). Accordingly, utilities of VGAM1502 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12838. HSPC067 (Accession NM_014158) is another VGAM1502 host target gene. HSPC067 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HSPC067, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPC067 BINDING SITE, designated SEQ ID:15459, to the nucleotide sequence of VGAM1502 RNA, herein designated VGAM

RNA, also designated SEQ ID:4213.

[51900] Another function of VGAM1502 is therefore inhibition of HSPC067 (Accession NM_014158). Accordingly, utilities of VGAM1502 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPC067. KIAA1210 (Accession XM_172801) is another VGAM1502 host target gene. KIAA1210 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1210, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1210 BINDING SITE, designated SEQ ID:46089, to the nucleotide sequence of VGAM1502 RNA, herein designated VGAM RNA, also designated SEQ ID:4213.

[51901] Another function of VGAM1502 is therefore inhibition of KIAA1210 (Accession XM_172801). Accordingly, utilities of VGAM1502 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1210. KIAA1676 (Accession XM_167612) is another VGAM1502 host target gene. KIAA1676 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1676, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1676 BINDING SITE, designated SEQ ID:44730, to the nucleotide sequence of VGAM1502 RNA, herein designated VGAM RNA, also designated SEQ ID:4213.

[51902] Another function of VGAM1502 is therefore inhibition of KIAA1676 (Accession XM_167612). Accordingly, utilities of VGAM1502 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1676. Meis1, Myeloid Ecotropic Viral Integration Site 1 Homolog 3 (mouse) (MEIS3, Accession XM_085721) is another VGAM1502 host target gene. MEIS3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MEIS3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MEIS3 BINDING SITE, designated SEQ ID:38310, to the nucleotide sequence of VGAM1502 RNA, herein designated VGAM RNA, also designated SEQ ID:4213.

[51903] Another function of VGAM1502 is therefore inhibition of Meis1, Myeloid Ecotropic Viral Integration Site 1 Homolog

3 (mouse) (MEIS3, Accession XM_085721). Accordingly, utilities of VGAM1502 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEIS3. poly(rC) Binding Protein 4 (PCBP4, Accession NM_020418) is another VGAM1502 host target gene. PCBP4 BINDING SITE1 through PCBP4 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PCBP4, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCBP4 BINDING SITE1 through PCBP4 BINDING SITE3, designated SEQ ID:21679, SEQ ID:26894 and SEQ ID:26896 respectively, to the nucleotide sequence of VGAM1502 RNA, herein designated VGAM RNA, also designated SEQ ID:4213.

[51904] Another function of VGAM1502 is therefore inhibition of poly(rC) Binding Protein 4 (PCBP4, Accession NM_020418). Accordingly, utilities of VGAM1502 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCBP4. Solute Carrier Family 1 (glutamate transporter), Member 7 (SLC1A7, Accession NM_006671) is another VGAM1502 host target gene. SLC1A7 BINDING SITE is HOST TARGET binding site found

in the 3` untranslated region of mRNA encoded by SLC1A7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC1A7 BINDING SITE, designated SEQ ID:13492, to the nucleotide sequence of VGAM1502 RNA, herein designated VGAM RNA, also designated SEQ ID:4213.

[51905] Another function of VGAM1502 is therefore inhibition of Solute Carrier Family 1 (glutamate transporter), Member 7 (SLC1A7, Accession NM_006671). Accordingly, utilities of VGAM1502 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC1A7. Zinc Finger, DHHC Domain Containing 3 (ZDHHC3, Accession NM_016598) is another VGAM1502 host target gene. ZDHHC3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZDHHC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZDHHC3 BINDING SITE, designated SEQ ID:18690, to the nucleotide sequence of VGAM1502 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4213.

[51906] Another function of VGAM1502 is therefore inhibition of Zinc Finger, DHHC Domain Containing 3 (ZDHHC3, Accession NM_016598). Accordingly, utilities of VGAM1502 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZDHHC3. LOC157918 (Accession XM_098842) is another VGAM1502 host target gene. LOC157918 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC157918, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157918 BINDING SITE, designated SEQ ID:41901, to the nucleotide sequence of VGAM1502 RNA, herein designated VGAM RNA, also designated SEQ ID:4213.

[51907] Another function of VGAM1502 is therefore inhibition of LOC157918 (Accession XM_098842). Accordingly, utilities of VGAM1502 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157918. LOC257468 (Accession XM_170838) is another VGAM1502 host target gene. LOC257468 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC257468, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257468 BINDING SITE, designated SEQ ID:45625, to the nucleotide sequence of VGAM1502 RNA, herein designated VGAM RNA, also designated SEQ ID:4213.

[51908] Another function of VGAM1502 is therefore inhibition of LOC257468 (Accession XM_170838). Accordingly, utilities of VGAM1502 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257468. LOC257486 (Accession XM_045029) is another VGAM1502 host target gene. LOC257486 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257486, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257486 BINDING SITE, designated SEQ ID:34327, to the nucleotide sequence of VGAM1502 RNA, herein designated VGAM RNA, also designated SEQ ID:4213.

[51909] Another function of VGAM1502 is therefore inhibition of LOC257486 (Accession XM_045029). Accordingly, utilities

of VGAM1502 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257486. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1503 (VGAM1503) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51910] VGAM1503 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1503 was detected is described hereinabove with reference to Figs. 1-8.

[51911] VGAM1503 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Aphid Lethal Paralysis Virus. VGAM1503 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51912] VGAM1503 gene encodes a VGAM1503 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1503 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM1503 precursor RNA is designated SEQ ID:1489, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1489 is located at position 9098 relative to the genome of Aphid Lethal Paralysis Virus.

[51913] VGAM1503 precursor RNA folds onto itself, forming VGAM1503 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51914] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1503 folded precursor RNA into VGAM1503 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 59%) nucleotide sequence of VGAM1503 RNA is designated SEQ ID:4214, and

is provided hereinbelow with reference to the sequence listing part.

[51915] VGAM1503 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1503 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1503 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[51916] VGAM1503 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1503 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1503 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM1503 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1503 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[51917] The complementary binding of VGAM1503 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1503 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1503 host target RNA into VGAM1503 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51918] It is appreciated that VGAM1503 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1503 host target genes. The mRNA of each one of this plurality of VGAM1503 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com–

plementary to VGAM1503 RNA, herein designated VGAM RNA, and which when bound by VGAM1503 RNA causes inhibition of translation of respective one or more VGAM1503 host target proteins.

[51919] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1503 gene, herein designated VGAM GENE, on one or more VGAM1503 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[51920] It is yet further appreciated that a function of VGAM1503 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1503 include diagnosis, prevention and treatment of viral infection by Aphid Lethal Paralysis Virus. Specific functions, and accordingly utilities, of VGAM1503 correlate with, and may be deduced from, the identity of the host target genes which VGAM1503 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51921] Nucleotide sequences of the VGAM1503 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1503 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1503 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1503 are further described hereinbelow with reference to Table 1.

[51922] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1503 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1503 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[51923] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM1503 gene, herein designated VGAM is inhibition of expression of VGAM1503 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1503 correlate with, and may be deduced from, the identity of the target genes which VGAM1503 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[51924] Polycystic Kidney and Hepatic Disease 1 (autosomal recessive) (PKHD1, Accession NM_138694) is a VGAM1503 host target gene. PKHD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PKHD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PKHD1 BINDING SITE, designated SEQ ID:28937, to the nucleotide sequence of VGAM1503 RNA, herein designated VGAM RNA, also designated SEQ ID:4214.

[51925] A function of VGAM1503 is therefore inhibition of Polycystic Kidney and Hepatic Disease 1 (autosomal recessive) (PKHD1, Accession NM_138694). Accordingly, utilities of VGAM1503 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PKHD1.

Suppressor of Cytokine Signaling 5 (SOCS5, Accession NM_014011) is another VGAM1503 host target gene. SOCS5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SOCS5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SOCS5 BINDING SITE, designated SEQ ID:15231, to the nucleotide sequence of VGAM1503 RNA, herein designated VGAM RNA, also designated SEQ ID:4214.

[51926] Another function of VGAM1503 is therefore inhibition of Suppressor of Cytokine Signaling 5 (SOCS5, Accession NM_014011). Accordingly, utilities of VGAM1503 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SOCS5. ATPase, Class II, Type 9A (ATP9A, Accession XM_030577) is another VGAM1503 host target gene. ATP9A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ATP9A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP9A BINDING SITE,

designated SEQ ID:31075, to the nucleotide sequence of VGAM1503 RNA, herein designated VGAM RNA, also designated SEQ ID:4214.

[51927] Another function of VGAM1503 is therefore inhibition of ATPase, Class II, Type 9A (ATP9A, Accession XM_030577). Accordingly, utilities of VGAM1503 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP9A. DKFZP434P0721 (Accession XM_033181) is another VGAM1503 host target gene. DKFZP434P0721 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434P0721, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434P0721 BINDING SITE, designated SEQ ID:31869, to the nucleotide sequence of VGAM1503 RNA, herein designated VGAM RNA, also designated SEQ ID:4214.

[51928] Another function of VGAM1503 is therefore inhibition of DKFZP434P0721 (Accession XM_033181). Accordingly, utilities of VGAM1503 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434P0721. KIAA1255 (Accession XM_040626)

is another VGAM1503 host target gene. KIAA1255 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1255, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1255 BINDING SITE, designated SEQ ID:33347, to the nucleotide sequence of VGAM1503 RNA, herein designated VGAM RNA, also designated SEQ ID:4214.

[51929] Another function of VGAM1503 is therefore inhibition of KIAA1255 (Accession XM_040626). Accordingly, utilities of VGAM1503 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1255. RAB22A, Member RAS Oncogene Family (RAB22A, Accession XM_009454) is another VGAM1503 host target gene. RAB22A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAB22A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB22A BINDING SITE, designated SEQ ID:30110, to the nucleotide sequence of VGAM1503 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4214.

[51930] Another function of VGAM1503 is therefore inhibition of RAB22A, Member RAS Oncogene Family (RAB22A, Accession XM_009454). Accordingly, utilities of VGAM1503 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB22A. LOC129607 (Accession XM_059368) is another VGAM1503 host target gene. LOC129607 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC129607, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC129607 BINDING SITE, designated SEQ ID:36975, to the nucleotide sequence of VGAM1503 RNA, herein designated VGAM RNA, also designated SEQ ID:4214.

[51931] Another function of VGAM1503 is therefore inhibition of LOC129607 (Accession XM_059368). Accordingly, utilities of VGAM1503 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC129607. LOC157918 (Accession XM_098842) is another VGAM1503 host target gene. LOC157918 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC157918, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157918 BINDING SITE, designated SEQ ID:41893, to the nucleotide sequence of VGAM1503 RNA, herein designated VGAM RNA, also designated SEQ ID:4214.

[51932] Another function of VGAM1503 is therefore inhibition of LOC157918 (Accession XM_098842). Accordingly, utilities of VGAM1503 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157918. LOC157919 (Accession XM_088420) is another VGAM1503 host target gene. LOC157919 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC157919, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157919 BINDING SITE, designated SEQ ID:39680, to the nucleotide sequence of VGAM1503 RNA, herein designated VGAM RNA, also designated SEQ ID:4214.

[51933] Another function of VGAM1503 is therefore inhibition of LOC157919 (Accession XM_088420). Accordingly, utilities

of VGAM1503 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157919. LOC219623 (Accession XM_166143) is another VGAM1503 host target gene. LOC219623 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC219623, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219623 BINDING SITE, designated SEQ ID:43947, to the nucleotide sequence of VGAM1503 RNA, herein designated VGAM RNA, also designated SEQ ID:4214.

[51934] Another function of VGAM1503 is therefore inhibition of LOC219623 (Accession XM_166143). Accordingly, utilities of VGAM1503 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219623. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1504 (VGAM1504) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51935] VGAM1504 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1504 was detected is described hereinabove with reference to Figs. 1–8.

[51936] VGAM1504 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Aphid Lethal Paralysis Virus. VGAM1504 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51937] VGAM1504 gene encodes a VGAM1504 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1504 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1504 precursor RNA is designated SEQ ID:1490, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1490 is located at position 8300 relative to the genome of Aphid Lethal Paralysis Virus.

[51938] VGAM1504 precursor RNA folds onto itself, forming VGAM1504 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51939] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1504 folded precursor RNA into VGAM1504 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 57%) nucleotide sequence of VGAM1504 RNA is designated SEQ ID:4215, and is provided hereinbelow with reference to the sequence listing part.

[51940] VGAM1504 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1504 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1504 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[51941] VGAM1504 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1504 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1504 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1504 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1504 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[51942] The complementary binding of VGAM1504 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1504 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1504 host target RNA into VGAM1504 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51943] It is appreciated that VGAM1504 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1504 host target genes. The mRNA of each one of this plurality of VGAM1504 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1504 RNA, herein designated VGAM RNA, and which when bound by VGAM1504 RNA causes inhibition of translation of respective one or more VGAM1504 host target proteins.

[51944] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1504 gene, herein designated VGAM GENE, on one or more VGAM1504 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[51945] It is yet further appreciated that a function of VGAM1504 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1504 include diagnosis, prevention and treatment of viral infection by Aphid Lethal Paralysis Virus. Specific functions, and accordingly utilities, of VGAM1504 correlate with, and may be deduced from, the identity of the host target genes which VGAM1504 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51946] Nucleotide sequences of the VGAM1504 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the
`diced` VGAM1504 RNA, herein designated VGAM RNA,
and a schematic representation of the secondary folding
of VGAM1504 folded precursor RNA, herein designated
VGAM FOLDED PRECURSOR RNA, of VGAM1504 are further
described hereinbelow with reference to Table 1.

[51947] Nucleotide sequences of host target binding sites, such as
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of
Fig. 1, found on VGAM1504 host target RNA, and
schematic representation of the complementarity of each
of these host target binding sites to VGAM1504 RNA,
herein designated VGAM RNA, are described hereinbelow
with reference to Table 2.

[51948] As mentioned hereinabove with reference to Fig. 1, a
function of VGAM1504 gene, herein designated VGAM is
inhibition of expression of VGAM1504 target genes. It is
appreciated that specific functions, and accordingly utili-
ties, of VGAM1504 correlate with, and may be deduced
from, the identity of the target genes which VGAM1504
binds and inhibits, and the function of these target genes,
as elaborated hereinbelow.

[51949] GATA Binding Protein 2 (GATA2, Accession NM_002050) is
a VGAM1504 host target gene. GATA2 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GATA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GATA2 BINDING SITE, designated SEQ ID:7805, to the nucleotide sequence of VGAM1504 RNA, herein designated VGAM RNA, also designated SEQ ID:4215.

[51950] A function of VGAM1504 is therefore inhibition of GATA Binding Protein 2 (GATA2, Accession NM_002050). Accordingly, utilities of VGAM1504 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GATA2. MGC2306 (Accession NM_032638) is another VGAM1504 host target gene. MGC2306 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC2306, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2306 BINDING SITE, designated SEQ ID:26355, to the nucleotide sequence of VGAM1504 RNA, herein designated VGAM RNA, also designated SEQ ID:4215.

[51951] Another function of VGAM1504 is therefore inhibition of MGC2306 (Accession NM_032638). Accordingly, utilities of VGAM1504 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2306. Serine Palmitoyltransferase, Long Chain Base Subunit 2 (SPTLC2, Accession NM_004863) is another VGAM1504 host target gene. SPTLC2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SPTLC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPTLC2 BINDING SITE, designated SEQ ID:11278, to the nucleotide sequence of VGAM1504 RNA, herein designated VGAM RNA, also designated SEQ ID:4215.

[51952] Another function of VGAM1504 is therefore inhibition of Serine Palmitoyltransferase, Long Chain Base Subunit 2 (SPTLC2, Accession NM_004863). Accordingly, utilities of VGAM1504 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPTLC2. LOC51014 (Accession XM_038077) is another VGAM1504 host target gene. LOC51014 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by LOC51014, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51014 BINDING SITE, designated SEQ ID:32752, to the nucleotide sequence of VGAM1504 RNA, herein designated VGAM RNA, also designated SEQ ID:4215.

[51953] Another function of VGAM1504 is therefore inhibition of LOC51014 (Accession XM_038077). Accordingly, utilities of VGAM1504 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51014. LOC51213 (Accession NM_016383) is another VGAM1504 host target gene. LOC51213 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51213, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51213 BINDING SITE, designated SEQ ID:18527, to the nucleotide sequence of VGAM1504 RNA, herein designated VGAM RNA, also designated SEQ ID:4215.

[51954] Another function of VGAM1504 is therefore inhibition of LOC51213 (Accession NM_016383). Accordingly, utilities

of VGAM1504 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51213. LOC92399 (Accession NM_138777) is another VGAM1504 host target gene. LOC92399 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92399, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92399 BINDING SITE, designated SEQ ID:29011, to the nucleotide sequence of VGAM1504 RNA, herein designated VGAM RNA, also designated SEQ ID:4215.

[51955] Another function of VGAM1504 is therefore inhibition of LOC92399 (Accession NM_138777). Accordingly, utilities of VGAM1504 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92399. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1505 (VGAM1505) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[51956] VGAM1505 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1505 was detected is described hereinabove with reference to Figs. 1–8.

[51957] VGAM1505 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Aphid Lethal Paralysis Virus. VGAM1505 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[51958] VGAM1505 gene encodes a VGAM1505 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1505 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1505 precursor RNA is designated SEQ ID:1491, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1491 is located at position 8120 relative to the genome of Aphid Lethal Paralysis Virus.

[51959] VGAM1505 precursor RNA folds onto itself, forming VGAM1505 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[51960] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1505 folded precursor RNA into VGAM1505 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1505 RNA is designated SEQ ID:4216, and is provided hereinbelow with reference to the sequence listing part.

[51961] VGAM1505 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1505 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1505 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[51962] VGAM1505 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1505 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1505 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1505 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1505 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[51963] The complementary binding of VGAM1505 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1505 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1505 host target RNA into VGAM1505 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[51964] It is appreciated that VGAM1505 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1505 host target genes. The mRNA of each one of this plurality of VGAM1505 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1505 RNA, herein designated VGAM RNA, and which when bound by VGAM1505 RNA causes inhibition of translation of respective one or more VGAM1505 host target proteins.

[51965] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1505 gene, herein designated VGAM GENE, on one or more VGAM1505 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[51966] It is yet further appreciated that a function of VGAM1505 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1505 include diagnosis, prevention and treatment of viral infection by Aphid Lethal Paralysis Virus. Specific functions, and accordingly utilities, of VGAM1505 correlate with, and may be deduced from, the identity of the host target genes which VGAM1505 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[51967] Nucleotide sequences of the VGAM1505 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the
`diced` VGAM1505 RNA, herein designated VGAM RNA,
and a schematic representation of the secondary folding
of VGAM1505 folded precursor RNA, herein designated
VGAM FOLDED PRECURSOR RNA, of VGAM1505 are further
described hereinbelow with reference to Table 1.

[51968] Nucleotide sequences of host target binding sites, such as
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of
Fig. 1, found on VGAM1505 host target RNA, and
schematic representation of the complementarity of each
of these host target binding sites to VGAM1505 RNA,
herein designated VGAM RNA, are described hereinbelow
with reference to Table 2.

[51969] As mentioned hereinabove with reference to Fig. 1, a
function of VGAM1505 gene, herein designated VGAM is
inhibition of expression of VGAM1505 target genes. It is
appreciated that specific functions, and accordingly utili-
ties, of VGAM1505 correlate with, and may be deduced
from, the identity of the target genes which VGAM1505
binds and inhibits, and the function of these target genes,
as elaborated hereinbelow.

[51970] UDP-Gal:betaGlcNAc Beta 1,3-galactosyltransferase,
Polypeptide 3 (B3GALT3, Accession NM_033167) is a

VGAM1505 host target gene. B3GALT3 BINDING SITE1 and B3GALT3 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by B3GALT3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of B3GALT3 BINDING SITE1 and B3GALT3 BINDING SITE2, designated SEQ ID:27017 and SEQ ID:27020 respectively, to the nucleotide sequence of VGAM1505 RNA, herein designated VGAM RNA, also designated SEQ ID:4216.

[51971] A function of VGAM1505 is therefore inhibition of UDP-Gal:betaGlcNAc Beta 1,3-galactosyltransferase, Polypeptide 3 (B3GALT3, Accession NM_033167). Accordingly, utilities of VGAM1505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B3GALT3. Fukuyama Type Congenital Muscular Dystrophy (fukutin) (FCMD, Accession NM_006731) is another VGAM1505 host target gene. FCMD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FCMD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of FCMD BINDING SITE, designated SEQ ID:13572, to the nucleotide sequence of VGAM1505 RNA, herein designated VGAM RNA, also designated SEQ ID:4216.

[51972] Another function of VGAM1505 is therefore inhibition of Fukuyama Type Congenital Muscular Dystrophy (fukutin) (FCMD, Accession NM_006731). Accordingly, utilities of VGAM1505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FCMD. V-maf Musculoaponeurotic Fibrosarcoma Oncogene Homolog K (avian) (MAFK, Accession NM_002360) is another VGAM1505 host target gene. MAFK BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MAFK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAFK BINDING SITE, designated SEQ ID:8173, to the nucleotide sequence of VGAM1505 RNA, herein designated VGAM RNA, also designated SEQ ID:4216.

[51973] Another function of VGAM1505 is therefore inhibition of V-maf Musculoaponeurotic Fibrosarcoma Oncogene Homolog K (avian) (MAFK, Accession NM_002360), a gene
